- €108 (see above) in respect of the 300 shares expected to vest in year 3, for which the expected charge to profit or loss is €250 (300 shares × €2.50 × 1/3). The tax deduction accounted for in profit or loss is therefore restricted to 30% of €250 = €75, with the balance of €33 credited to equity.

	Debit	Credit
Year 2		
Current tax (statement of financial position)	90	
Current tax (profit or loss)[3]		90
Deferred tax (profit or loss)[4]	18	
Deferred tax (equity)[4]	51	
Deferred tax (statement of financial position)[4]		69

[3] The current tax deduction relates to the 150 shares vesting in year 2, for which the cumulative charge to profit or loss is €420 (150 shares × €2.80). The cumulative tax deduction accounted for in profit or loss would therefore be restricted to 30% of €420 = €126. The entire amount of current tax deduction received (€90) is therefore credited to profit or loss.

[4] At the end of year 2, the deferred tax relates to the 300 shares expected to vest at the end of year 3, which has been measured based on the year end share price of €2.00. This is lower than the share price on which the IFRS 2 charge has been based. Therefore, there is no requirement to allocate any deferred tax to equity, and the balance of deferred tax in equity is reduced to nil. The balance of the total €69 movement in the deferred tax balance is allocated to profit or loss.

The net tax credit in profit or loss in year 2 of €72 (current tax credit €90, less deferred tax charge €18) can be seen as representing:

Credit relating to IFRS 2 expense recognised in the period[5]	105
Charge relating to remeasurement of prior year deferred tax[6]	(33)
Total	72

[5] In this case the tax credit recognised in profit or loss is not the 'expected' credit of €138 (IFRS 2 charge of €460 @ 30%). This is because the current tax deduction for the shares vesting in year 2 and the deferred tax deduction for the shares expected to vest in year 3 are based on the year-end share price of €2.00, which is lower than the share values used to calculate the IFRS 2 charge (€2.80 and €2.50). During the year, an IFRS 2 expense has been recognised for 75 'whole share equivalents' in respect of the shares vesting in year 2 (150 shares × 1/2) and 100 'whole share equivalents' in respect of the shares expected to vest in year 3 (300 shares × 1/3), a total of 175 'whole share equivalents'. Accordingly the credit for the year is €105 (175 × €2.00 × 30%).

[6] In year 1 the deferred tax credit (based on the year 1 year-end share price of €3.60) recognised in profit of loss in respect of the shares expected to vest in years 2 and 3 was €138. If this had been based on the year 2 year-end share price of €2.00 this would have been only €105. [150 × 1/2 × €2.00] + [300 × 1/3 × €2.00] = €350 × 30% = €105. €138 – €105 = €33.

	Debit	Credit
Year 3		
Current tax (statement of financial position)	540	
Current tax (profit or loss)		225
Current tax (equity)[7]		315
Deferred tax (profit or loss)	120	
Deferred tax (statement of financial position)[8]		120

[7] The current tax deduction relates to the 300 shares vesting in year 1, for which the cumulative charge to profit or loss is €750 (300 shares × €2.50). The tax deduction accounted for in profit or loss is therefore restricted to 30% of €750 = €225.

[8] The deferred tax asset, all of which was – on a cumulative basis – recognised in profit or loss, is derecognised in profit or loss.

The net tax credit in profit or loss in year 3 of €105 (current tax credit €225, less deferred tax charge €120) can be seen as representing:

Credit relating to IFRS 2 expense recognised in the period[9]	75
Credit relating to remeasurement of prior year deferred tax[10]	30
Total	105

[9] €250 @ 30%.

[10] The opening balance deferred tax asset of €120 is based on the year 2 share price of €2.00. If this had been based on the year 3 share price of €6.00 it would have been €360. However, the amount recognised in profit or loss would have been restricted to €150 – 30% of the cumulative expense at the end of year 2 of €500 (300 shares × €2.50 × 2/3). €150 – €120 = €30.

10.8.3 Allocation when more than one award is outstanding

As noted above, IAS 12 requires that, 'where the amount of any tax deduction ... exceeds the amount of the related cumulative remuneration expense, the current or deferred tax associated with the excess should be recognised directly in equity'. Some have therefore argued that, as drafted, IAS 12 requires the cumulative expense for all outstanding share schemes to be compared in aggregate with the aggregate tax deduction for all share schemes. Others argue that the comparison should be made for each scheme separately. The effect of each treatment is illustrated in Example 33.55 below.

Example 33.55: Tax deductions for share-based payment transactions – more than one award

An entity that pays tax at 30% has two outstanding share schemes, Scheme A and Scheme B. The entity receives tax deductions for share-based payment transactions based on their intrinsic value at the date of exercise.

At the end of the reporting period, the cumulative expense charged for each scheme is £1 million. Scheme A has a negative intrinsic value at the end of the reporting period and is not expected to recover its value to the extent that employees will exercise their options. Accordingly no deferred tax asset is recognised for Scheme A. Scheme B has an intrinsic value of £1.5 million. The entity will therefore record a deferred tax asset of £450,000 (30% of £1.5 million), subject to the recognition criteria for deferred tax assets being satisfied.

Those who argue that comparison of share-based payment expense to tax deduction should be made on an aggregated basis would conclude that, because the cumulative potential tax deduction of £1.5 million (which relates only to Scheme B) is lower than the cumulative aggregate expense for both Scheme A and Scheme B (£2 million), the deferred tax income should be recognised entirely in profit or loss.

However, those who argue that comparison of share-based payment expense to tax deduction should be made on a discrete basis for each scheme would conclude that, because the cumulative tax deduction for Scheme B (£1.5 million) is higher than the cumulative aggregate expense for Scheme B (£1 million), only £300,000 of the deferred tax income (30% of £1 million) should be recognised in profit or loss, with the remaining £150,000 recognised in equity.

In our view, the comparison must be made on a discrete scheme-by-scheme basis. As noted at 10.8.2 above, it is clear from IAS 12 and the Basis for Conclusions to IFRS 2 that the IASB's intention was to exclude from profit or loss any tax deduction that is effectively given for the growth in fair value of an award that accrues after grant date. *[IAS 12.68C, IFRS 2.BC311-BC329]*. This can be determined only on an award-by-award basis. Moreover, IAS 12 requires the amount of any tax deduction to be accounted for in equity when it 'exceeds the amount of the *related* cumulative remuneration expense' (emphasis added). In Example 33.55 above, the tax deduction on Scheme B cannot, in our view, be said to be 'related' to the remuneration expense for Scheme A. Accordingly, the expense relating to Scheme A is not relevant for determining the amount of tax income relating to Scheme B that is required to be accounted for in equity.

It may also be that what is regarded as a single scheme may need to be further sub-divided for the purposes of the comparison for reasons such as the following:

- where the same award is made to regular employees and also to top management, the fair value of the options granted to each population may nevertheless be different for the purposes of IFRS 2 given different exercise behaviours (see Chapter 34 at 8.5.2.A);
- an award is made to employees which attracts tax deductions in more than one tax jurisdiction; or
- an award is made in the same tax jurisdiction to employees in different entities, not all of which are able to recognise a deferred tax asset.

10.8.4 Staggered exercise of awards

The example in IAS 12, the substance of which is included in Example 33.53 at 10.8.1 above, addresses a situation in which all vested awards are exercised simultaneously. In practice, however, vested awards are often exercised at different dates.

Once an award under a given scheme has vested, and different awards in that scheme are exercised at different times, the question arises as to whether the 'cap' on recognition of the tax benefit in profit or loss should be calculated by reference to the cumulative expense recognised in respect of the total number of awards vested, or in respect only of as yet unexercised vested awards. In our view, where a tax deduction is received on exercise, the calculation must be undertaken by reference to the cumulative expense recognised for outstanding unexercised options. This is illustrated by Example 33.56 below.

Example 33.56: Tax deductions for share-based payment transactions – staggered exercise of award

At the start of year 1, an entity with a tax rate of 40% grants 20 options each to 5 employees. The options have a fair value of €5 and vest at the end of year 2. The options vest in full. 25 are exercised at the end of year 3 and 75 at the end of year 6. The entity is able to support the view that any deferred tax asset arising before exercise will be recoverable, and may therefore be recognised in full.

Tax deductions are given in the year of exercise, based on the intrinsic value of the options at the date of exercise. The intrinsic value of options at the end of each reporting period is as follows:

Year	*Intrinsic value per option*
	€
1	3
2	8
3	8
4	1
5	7
6	6

On the basis of the information above:

- there would be an IFRS 2 charge of €250 in years 1 and 2 (20 options × 5 employees × €5 × 1/2 (portion of vesting period)
- current and deferred tax assets should be recognised at the end of each period as follows:

Current tax

Year	*Number of options exercised*	*Intrinsic value per option*	*Total intrinsic value*	*Tax effect at 40%*
		€	€	€
3	25	8	200	80
6	75	6	450	180

Deferred tax

Year	*Number of options outstanding*	*Temporary difference per option*	*Total temporary difference*	*Tax effect at 40%*
		€	€	€
1	100	1.5[1]	150	60
2	100	8	800	320
3	75	8	600	240
4	75	1	75	30
5	75	7	525	210
6	–	6	–	–

[1] Intrinsic value €3 × 1/2 (expired portion of vesting period).

The required accounting entries for income taxes are as follows

	Debit €	Credit €
Year 1		
Deferred tax (statement of financial position)	60	
Deferred tax (profit or loss)[1]		60
Year 2		
Deferred tax (statement of financial position)[2]	260	
Deferred tax (profit or loss)[3]		140
Deferred tax (equity)		120
Year 3		
Deferred tax (profit or loss)[4]	50	
Deferred tax (equity)	30	
Deferred tax (statement of financial position)[5]		80
Current tax (statement of financial position)[6]	80	
Current tax (profit or loss)[4]		50
Current tax (equity)		30
Year 4		
Deferred tax (profit or loss)[7]	120	
Deferred tax (equity)	90	
Deferred tax (statement of financial position)[8]		210
Year 5		
Deferred tax (statement of financial position)[9]	180	
Deferred tax (profit or loss)[10]		120
Deferred tax (equity)		60
Year 6		
Deferred tax (profit or loss)[11]	150	
Deferred tax (equity)	60	
Deferred tax (statement of financial position)		210
Current tax (statement of financial position)[12]	180	
Current tax (profit or loss)[13]		150
Current tax (equity)		30

1 The cumulative tax income is based on expected deductions of €150, which is less than the cumulative IFRS 2 charge of €250 (see above).

2 Year 2 year-end balance of €320 (see table above), less €60 recognised at end of year 1 = €140.

3 Cumulative deferred tax recognised in profit or loss must not exceed 40% × €500 (cumulative IFRS 2 charge) = €200. This limits the credit for year 2 to €200 less the €60 credited in year 1 = €140.

4 Reversal of deferred tax income previously recognised in profit or loss for the 25 options exercised: 25 × €5 [IFRS 2 charge per option] × 40% = €50. This also represents the limit on the amount of current tax deduction that can be recognised in profit or loss.

5 Year 3 year-end balance of €240 (see table above), less €320 recognised at end of year 2 = €80.

6 25 options × €8 intrinsic value × 40% = €80.

In years 4 to 6, the amount of tax recognised in profit or loss is restricted by the cumulative IFRS 2 expense of €375 for the 75 options left outstanding (75 options × €5).

7 Cumulative (maximum) tax deduction already recognised in profit or loss is €375 @ 40% = €150. This needs to be reduced to €30 (year end deferred tax balance), giving rise to a charge of €150 – €30 = €120. This can be seen as representing the fact that, at the start of the period a cumulative potential tax deduction of €5 per award had been recognised in profit or loss. At the end of the period it is expected that deductions of only €1 per award will be available. Therefore there is a loss to be recognised in profit or loss of 75 awards × (€5 – €1) × 40% = €120.

8 Year 4 year-end balance of €30 (see table above), less €240 recognised at end of year 3 = €(210).

9 Year 5 year-end balance of €210 (see table above), less €30 recognised at end of year 4 = €180.

10 Cumulative maximum tax deduction that can be recognised in profit or loss is €150 (see note 7). €30 cumulative deduction is brought forward, so that credit for period is limited to €150 – €30 = €120.

11 Reversal of deferred tax previously recognised. The amount previously taken to profit or loss was limited to €150 (see notes 7 and 9).

12 75 options × €6 × 40% = €180.

13 Deduction restricted to €375 [IFRS 2 charge] × 40% = €150.

It will be noted that the cumulative effect of the above entries in profit or loss is as follows (tax income in brackets):

Year	*Deferred tax*	*Current tax*	*Total*
	€	€	€
1	(60)		(60)
2	(140)		(140)
3	50	(50)	–
4	120		120
5	(120)		(120)
6	150	(150)	–
		Total	(200)

The cumulative effect of the above entries in equity is as follows (tax income in brackets):

Year	*Deferred tax*	*Current tax*	*Total*
	€	€	€
1			–
2	(120)		(120)
3	30	(30)	–
4	90		90
5	(60)		(60)
6	60	(30)	30
		Total	(60)

The overall effect is to take credit in profit or loss for the lower of total tax deductions actually received of €260 (€80 in year 3 and €180 in year 6) and the tax deductions on the IFRS 2 expense of €200 (40% of €500). The excess tax deductions of €60 are recognised in equity.

10.8.5 Replacement awards in a business combination

IFRS 3 contains some detailed provisions on the treatment of share-based payment awards issued by an acquirer to replace awards made by the acquired entity before the business combination occurred. These are discussed in Chapter 34 at 11.

IFRS 3 amended IAS 12 to include an illustrative example for the treatment of tax deductions on such replacement awards, the substance of which is reproduced as Example 33.57 below. *[IAS 12 IE Example 6]*.

Example 33.57: Deferred tax on replacement share-based awards in a business combination

On 1 January 2021 Entity A acquired Entity B. A paid cash consideration of €400 million to the former owners of B. At the acquisition date B had outstanding fully-vested employee share options with a fair value of €100 million. As part of the business combination B's outstanding share options are replaced by fully vested share options of A (replacement awards) with a market-based measure of €100 million and an intrinsic value of €80 million. In accordance with IFRS 3, the replacement awards are part of the consideration transferred for B (see Chapter 34 at 11).

A tax deduction will be given only when the options are exercised, based on the intrinsic value of the options at that date. A's tax rate is 40%.

A recognises a deferred tax asset of €32 million (intrinsic value of €80m × 40%) on the replacement awards at the acquisition date (see 10.8.1 above). IAS 12 does not indicate the calculation if only part of the fair value of the award were regarded as part of the consideration transferred. However, it would be consistent with the general approach indicated at 10.8.2 above to calculate the tax base of the award by adjusting the intrinsic value by the ratio of the expired vesting period at acquisition to the total vesting period of the award (as determined for the purposes of IFRS 3 – see Chapter 34 at 11).

A measures the identifiable net assets obtained in the business combination (excluding deferred tax assets and liabilities) at €450 million, with a combined tax base of €300 million, giving rise to a taxable temporary difference at the acquisition date of €150 million, on which deferred tax at 40% of €60 million is recognised. Goodwill is calculated as follows:

	€m
Cash consideration	400
Replacement options	100
Total consideration	500
Identifiable net assets (excluding deferred tax)	(450)
Deferred tax asset	(32)
Deferred tax liability	60
Goodwill	78

Reductions in the carrying amount of goodwill are not deductible for tax purposes. In accordance with the initial recognition exception in IAS 12 (see 7.2 above), A recognises no deferred tax liability for the taxable temporary difference associated with the goodwill recognised in the business combination. The accounting entry for the business combination is therefore as follows:

	Debit €m	Credit €m
Goodwill	78	
Identifiable net assets	450	
Deferred tax asset	32	
Cash		400
Equity		100
Deferred tax liability		60

On 31 December 2021 the intrinsic value of the replacement awards is €120 million, in respect of which A recognises a deferred tax asset of €48 million (€120 m at 40%). This gives rise to deferred tax income of €16 million (€48 million recognised at 31 December 2021 less €32 million arising on acquisition). IAS 12 notes, somewhat redundantly, that this amount is credited to 'deferred tax income', but with no indication as to whether the amount should be recognised in profit or loss or in equity. In our view, the general principles of IAS 12 regarding tax deductions on share-based payment transactions suggest that the entire amount is recognised in equity. This is because the consolidated financial statements of A have never recognised any expense for the award in profit or loss (since it is attributed fully to the consideration transferred). Therefore none of the tax deductions can be recognised in profit or loss either.

10.8.6 Share-based payment transactions subject to transitional provisions of IFRS 1 and IFRS 2

IFRS 1 and IFRS 2 provide, respectively, first-time adopters and existing IFRS preparers with some transitional exemptions from accounting for share-based payment transactions. The accounting treatment of the tax effects of transactions to which these exemptions have been applied is discussed in Chapter 5 at 7.3.2. Whilst that discussion specifically addresses the tax effects of transactions subject to the exemption for first-time adopters of IFRS, it is equally applicable to the tax effects of transactions subject to the exemptions in IFRS 2 for existing IFRS preparers.

10.9 Change in tax status of entity or shareholders

Sometimes there is a change in an entity's tax assets and liabilities as a result of a change in the tax status of the entity itself or that of its shareholders. SIC-25 clarifies that the effect of such a change should be recognised in profit or loss except to the extent that it involves a remeasurement of tax originally accounted for in other comprehensive income or in equity, in which case the change should also be dealt with in, respectively, other comprehensive income or equity. *[SIC-25.4]*.

10.10 Previous revaluation of PP&E treated as deemed cost on transition to IFRS

IFRS 1 requires full retrospective application of standards effective at the end of a first-time adopter's first IFRS reporting period, unless a specific exemption is provided therein. *[IFRS 1.7]*. In some cases IFRS 1 allows an entity, on transition to IFRS, to treat the carrying amount of property, plant, and equipment (PP&E) revalued under its pre-transition GAAP as a deemed cost for the purposes of IFRS (see Chapter 5 at 5.5).

Where an asset is carried at deemed cost on transition to IFRS, but the tax base of the asset remains at original cost (or an amount based on original cost), the pre-transition revaluation will give rise to a temporary difference (often, a taxable temporary difference) associated with the asset. While the deemed cost provisions in IFRS 1 establish an appropriate measurement base for the carrying amount of previously revalued assets in the financial statements at the date of transition, they have no impact on whether a temporary difference exists. IFRS 1 does not provide an exemption from applying IAS 12, which requires deferred tax to be recognised on any such temporary difference at transition.

If, after transition, the deferred tax is required to be remeasured (e.g. because of a change in tax rate, or a re-basing of the asset for tax purposes), and the asset concerned was revalued outside profit or loss under pre-transition GAAP, the question arises as to whether the resulting deferred tax income or expense should be recognised in, or outside, profit or loss. A literal interpretation of IAS 12 would require changes relating to the past revaluation of the PP&E to be reflected in other comprehensive income, because that is where such an earlier revaluation would have been recorded under IFRS (see 10.2 above). However, where an entity elects to apply the cost model of IAS 16, the subsequent accounting treatment of the asset is the same, regardless of whether the 'deemed cost' of the asset on transition to IFRS was an earlier valuation, a revaluation as at the date of transition or original cost less depreciation and impairment up to that date. In all cases, subsequent depreciation and impairments are charged to profit or loss. In these circumstances, it could be argued that the deemed cost exemption on transition requires the asset to be treated in all respects as if its original cost had been the carrying value as at the transition date. In this way, any backward tracing of deferred tax in relation to past revaluations of an asset carried at 'deemed cost' should also be ignored and the effect of subsequent measurement should also be recognised in profit or loss.

In our view, either approach is acceptable as long as it is applied consistently.

10.11 Disposal of an interest in a subsidiary that does not result in a loss of control

Under IFRS 10 – *Consolidated Financial Statements* – a decrease in a parent's ownership interest in a subsidiary that does not result in a loss of control is accounted for in the consolidated financial statements as an equity transaction, i.e. a transaction with owners in their capacity as owners. *[IFRS 10.23]*. In these circumstances, the carrying amounts of the controlling and non-controlling interests are adjusted to reflect the changes in their relative interests in the subsidiary. 'The entity shall recognise directly in equity any difference between the amount by which the non-controlling interests are adjusted and the fair value of the consideration paid or received, and attribute it to the owners of the parent.' *[IFRS 10.B96]*. In other words, no changes in a subsidiary's assets (including goodwill) and liabilities are recognised in a transaction in which a parent increases or decreases its ownership interest in a subsidiary that it already controls. *[IFRS 10.BCZ173]*. Increases or decreases in the ownership interest in a subsidiary do not result in the recognition of a gain or loss. Accounting for disposals of interests that do not result in a loss of control is discussed in Chapter 7 at 4.

As the transaction is accounted for as an equity transaction, which does not affect profit or loss in the consolidated financial statements, one might assume that the full amount of any tax effect should also be recognised in equity. *[IAS 12.58(a)]*. However, this is not the case to the extent that any adjustment to non-controlling interests relates to the post acquisition profit of the subsidiary, which was previously recognised in the consolidated income statement, as illustrated in Example 33.58 below.

Example 33.58: Tax effect of a disposal of an interest in a subsidiary that does not result in a loss of control

A parent owns 100% of the equity shares of a subsidiary and presents the investment at a cost of $1,000,000 in its separate financial statements. At the end of the reporting period, the subsidiary's post acquisition profit and net asset value recognised in the parent's consolidated financial statements are $500,000 and $1,500,000 respectively. Previously, the parent had not recognised deferred taxation, as it considered it probable that the temporary difference would not reverse in the foreseeable future. The parent disposes of a 20% interest in the subsidiary for a cash consideration of $1,400,000 (the 'Transaction').

It is assumed that the tax base of the investment in the subsidiary is the same as its original cost of $1,000,000. The taxable gain is calculated on the same basis as the gain recognised in the separate financial statements and the applicable tax rate is 25%.

The parent recognises a gain of $1,200,000 (i.e. $1,400,000 – [$1,000,000 × 20%]) in its separate financial statements and is liable for a current tax of $300,000 (i.e. $1,200,000 × 25%).

The Transaction does not result in the parent losing control of the subsidiary and it is accounted for in equity in the consolidated financial statements of the parent. The parent recognises non-controlling interests of $300,000 (i.e. $1,500,000 × 20%) and credits equity for $1,100,000, being the difference between the consideration of $1,400,000 and the non-controlling interests of $300,000, in the consolidated financial statements of the parent.

What are the current and deferred tax effects in the consolidated financial statements if:

(a) the transaction is not completed until after the end of the reporting period; or

(b) the transaction is completed at the end of the reporting period?

If the transaction is not completed until after the end of the reporting period, no current tax is recognised. However, as the parent intends to recover 20% of its investment in the subsidiary through sale, it must recognise a deferred tax liability in the consolidated financial statements for the temporary difference associated with its investment in the subsidiary that is expected to reverse in the foreseeable future. *[IAS 12.39]*. Its carrying value in the consolidated financial statements is $1,500,000 and its tax base is $1,000,000. Accordingly, deferred tax of $25,000 (i.e. [$1,500,000 – $1,000,000] × 20% × 25%) should be recognised in profit or loss in the consolidated financial statements. This deferred tax would reverse through profit or loss upon disposal, because it relates to the post acquisition profit recognised in an earlier period. *[IAS 12.58]*.

If the transaction is completed at the end of the reporting period, the consolidated financial statements would include a current tax charge of $300,000 on the taxable gain on sale recorded by the subsidiary. Whilst the transaction is recorded in equity in the consolidated financial statements, because there is no loss of control, only $1,100,000 out of the total taxable gain of $1,200,000 was taken to non-controlling interests in equity. *[IAS 12.58(a)]*. $275,000 (i.e. $1,100,000 × 25%) of the current tax charge relates to the amount that is recognised directly in equity ($1,100,000) and is, therefore, recognised directly in equity. *[IAS 12.61A(b)]*. The remaining $25,000 (i.e. [$1,500,000 – $1,000,000] × 20% × 25%) is recognised as a current tax expense in profit or loss in the consolidated financial statements, as it does not relate to an amount directly recognised in equity, but to the crystallisation of part of the outside basis temporary difference arising from the post-acquisition profits of the subsidiary.

11 CONSOLIDATED TAX RETURNS AND OFFSET OF TAXABLE PROFITS AND LOSSES WITHIN GROUPS

In some jurisdictions one member of a group of companies may file a single tax return on behalf of all, or some, members of the group. Sometimes this is a mandatory requirement for a parent entity and its eligible subsidiaries operating in the same tax jurisdiction; and sometimes adoption is elective. In other jurisdictions, it is possible for one member of a group to transfer its tax losses to one or more other members of the group in order to reduce their tax liabilities. In some groups a company whose tax liability is reduced by such an arrangement may be required to make a payment to the member of the group that pays tax on its behalf, or transfers losses to it, as the case may be. In other groups no such charge is made.

Such transactions raise the question of the appropriate accounting treatment in the separate financial statements of the group entities involved – in particular, whether the company benefiting from such an arrangement should reflect income (or more likely a capital contribution) from another member of the group equal to the tax expense mitigated as a result of the arrangement.

Some argue that the effects of such transactions should be reflected in the separate financial statements of the entities involved, as is required by some national standards (e.g. those of the US and Australia). Others argue that, except to the extent that a management charge is actually made (see 11.1 below), there is no need to reflect such transactions in the separate financial statements of the entities involved. Those that take this view point out that it is inconsistent to require companies to show a capital contribution for tax losses ceded to them without charge, unless all other intragroup transactions are also restated on arm's-length terms – which would be somewhat radical. Moreover, IAS 24 – *Related Party Disclosures* – merely requires disclosure of the actual terms of such transactions, not that they be remeasured, either for financial reporting or disclosure purposes, on the same basis as a similar notional arm's length transaction (see Chapter 39).

IAS 12 is silent on the issue and, in our view, no single approach can be said to either be prohibited or required. Accordingly, a properly considered approach may be adopted, provided that it is applied on a consistent basis and the related judgements are disclosed where their impact is believed to be material. In arriving at an appropriate judgement, the discussion at 4.1 and 4.4 above is relevant in considering whether entities should apply IAS 12 or another standard (such as IAS 37). Any judgement should be based on the particular facts and circumstances relating to the legislation giving rise to tax-consolidation, the nature of the obligations and rights of entities in the group and local company law. As noted at 4.4 above, where there is a predominant local consensus in evidence or specific guidance issued by regulators in the relevant tax jurisdiction, then we believe that the entity should apply this consensus or guidance.

11.1 Examples of accounting by entities in a tax-consolidated group

In a typical tax-consolidation arrangement, a single consolidated annual tax return is prepared for the tax-consolidated group as a whole. Transactions between the entities in the tax-consolidated group are eliminated, and therefore ignored for tax purposes. A single legal entity in the group (usually the parent) is primarily liable for the current income tax liabilities of that group. Each entity in the group would be jointly and severally liable for the current income tax liability of the group if the parent entity defaults. There might also be a legally binding agreement between the entities in the group which establishes how tax assets and liabilities are allocated within the group.

As noted above, IAS 12 is silent on the issue and there is diversity in practice where these arrangements exist. Some entities apply IAS 37 principles to the recognition, measurement and allocation of current tax assets and liabilities to individual entities in the group, on the basis that tax is determined on the basis of the taxable profits of the group as a whole and not on the profits of the individual entities themselves. In that case current tax assets and liabilities are allocated on the basis of each entity's legal or constructive obligations to the tax authorities (for example where joint and several liability is determined to exist) or to other entities in the tax-consolidated group (including where formal agreements are implemented for the funding and sharing or tax liabilities and assets). Deferred tax is not accounted for in separate financial statements in these circumstances. Other entities apply the recognition and measurement principles of IAS 12 on the basis that tax is still determined on the basis of the taxable profits of each entity in the group on the obligations of each entity to the tax authorities. When IAS 12 is deemed to apply, entities will account for both current and deferred tax in their separate financial statements. Various approaches may be acceptable under IFRS for the determination of how current and deferred tax is allocated between entities in the tax-consolidated group. In Australia, where entities apply a standard virtually identical to IAS 12 in separate financial statements, three alternative approaches are suggested as examples of acceptable allocation methods:[57]

- a ‘stand-alone taxpayer’ approach for each entity, as if it continued to be a taxable entity in its own right.
- a ‘separate taxpayer within group’ approach for each entity, on the basis that the entity is subject to tax as part of the tax-consolidated group. This method requires adjustments for transactions and events occurring within the tax-consolidated group that do not give rise to a tax consequence for the group or that have a different tax consequence at the level of the group; and
- a ‘group allocation’ approach, under which the income tax amounts for the tax-consolidated group are allocated among each entity in the group.

Nevertheless, there may be other methods that are also appropriate.

11.2 Payments for intragroup transfer of tax losses

Where one member of a group transfers tax losses to another member of the group, the entity whose tax liability is reduced may be required, as matter of group policy, to pay an amount of compensation to the member of the group that transfers the losses to it. Such payments are known by different terms in different jurisdictions, but are referred to in the discussion below as ‘tax loss payments’.

Tax loss payments are generally made in an amount equal to the tax saved by the paying company. In some cases, however, payment may be made in an amount equal to the nominal amount of the tax loss, which will be greater than the amount of tax saved. This raises the question of how such payments should be accounted for.

The first issue is whether such payments should be recognised:

- in total comprehensive income; or
- as a distribution (in the case of a payment from a subsidiary to a parent) or a capital contribution (in the case of a payment from a parent to a subsidiary).

The second issue is, to the extent that the payments are accounted for in total comprehensive income, whether they should be classified as:

- income tax, allocated between profit or loss, other comprehensive income or equity (see 10 above). The argument for this treatment is that the payments made or received are amounts that would otherwise be paid to or received from (or offset against an amount paid to) a tax authority; or
- operating income or expense in profit or loss (on the grounds that, as a matter of fact, the payments are not made to or received from any tax authority).

IAS 12 is silent on these issues. However, there is a long-standing practice in many jurisdictions that such payments are treated as if they were income taxes. We believe that this practice is appropriate to the extent that the intragroup payment is for an amount up to the amount of tax that would otherwise have been paid by the paying company. Where a tax loss payment is made in excess of this amount, we consider that it is more appropriate to account for the excess not as an income tax but as either:

- a distribution or capital contribution (as applicable); or
- operating income or expense (as applicable).

In considering the applicable treatment, the legal and regulatory requirements in the entity's jurisdiction would also be relevant, for example if those local requirements stipulate whether the excess payment is, in law, a distribution. The chosen treatment should be applied consistently.

11.3 Recognition of deferred tax assets where tax losses are transferred in a group

The ability of one member of a group to transfer its tax losses to another member of the group that expects to have taxable profits against which those losses can be utilised is an example of a tax planning opportunity 'that will create taxable profit in appropriate periods'. *[IAS 12.29(b)]*. Accordingly, it would be appropriate to recognise in the entity's consolidated financial statements a deferred tax asset in respect of unused tax losses and unused tax credits that are expected to be utilised in this way. *[IAS 12.29]*.

In the separate financial statements of the member of the group that holds the unused losses and tax credits, it would only be appropriate to recognise an asset to the extent that this entity expects to benefit itself from any transfer. Such benefits might be in the form of payment for losses as discussed at 11.1 above, or as a result of taxable profits otherwise created in the surrendering entity as a result of the transfer. If the surrendering entity is not expected to receive any benefit in relation to the unused losses and tax credits given up, then no asset should be recognised in the separate financial statements of that entity.

12 BUSINESS COMBINATIONS

Additional deferred tax arises on business combinations as a result of items such as:

- the application of IAS 12 to the assets and liabilities of the acquired business in the consolidated financial statements, when it has not been applied in the separate financial statements of that business;
- where the acquired entity already applies IAS 12 in its own financial statements, the recognition in the fair value exercise of deferred tax in respect of assets and liabilities of the acquired entity where no deferred tax is provided in those financial statements. This may be the case where a temporary difference arose on initial recognition of an asset or liability in the acquired entity's own financial statements. Deferred tax would then be recognised in the acquirer's consolidated financial statements, because, in those statements, the difference arises on initial recognition in a business combination (see 7.2 above); and
- adjustments made to measure the assets and liabilities of the acquired business fair value, with consequential changes in the temporary differences associated with those assets and liabilities.

Any deferred tax assets or liabilities on temporary differences that arise on a business combination affect the amount of goodwill or bargain purchase gain. *[IAS 12.66]*. Example 33.26 at 7.5.1 above illustrates the application of this principle.

12.1 Measurement and recognition of deferred tax in a business combination

IFRS 3 generally requires assets acquired and liabilities assumed in a business combination to be:

- recognised only to the extent that they were assets or liabilities of the acquired entity at the date of acquisition; *[IFRS 3.10]* and
- measured at fair value. *[IFRS 3.18]*.

These provisions of IFRS 3 are discussed in more detail in Chapter 9 at 5. As exceptions to this general principle, IFRS 3 requires an acquirer to:

- recognise and measure a deferred tax asset or liability arising from the assets acquired and liabilities assumed in a business combination 'in accordance with IAS 12'; *[IFRS 3.24]* and
- account for the potential tax effects of temporary differences and carryforwards of an acquiree that exist at the acquisition date or arise as a result of the acquisition 'in accordance with IAS 12'. *[IFRS 3.25]*.

There are essentially two reasons underlying these exceptions. The first is that IAS 12 does not purport to measure future tax at fair value, but at an amount based on a prescribed model that takes no account of the time value of money. Secondly, and more subtly, IAS 12 requires a number of questions of both recognition and measurement to be resolved by reference to management's plans and expectations – in particular, the expected manner of recovery of assets (see 8.4 above) or the likelihood of recovering deferred tax assets (see 7.4 above). The expectations and plans of the acquirer may well differ from those of the acquired entity. For example, the acquired entity might have assessed, for the purposes of IAS 12, that an asset would be recovered through use, whereas the acquirer assesses it as recoverable through sale. The exceptions made by IFRS 3 allow the deferred tax recognised in a business combination to reflect the expectations of the acquirer rather than those of the acquiree.

Areas that give rise to particular difficulties of interpretation are:

- determining the manner of recovery of assets and settlement of liabilities at the date of the business combination (see 12.1.1 below); and
- deferred tax assets (see 12.1.2 below).

12.1.1 Determining the manner of recovery of assets and settlement of liabilities

As discussed at 8.4 above, IAS 12 requires deferred tax to be measured at an amount that reflects the tax consequences that would follow from the manner in which the entity expects to recover its assets or settle its liabilities. The expected manner of recovery or settlement may affect both the tax base of an asset or liability and the tax rate to be applied to any temporary difference arising.

As further noted above, the acquirer's assessment of the manner of recovery for the purposes of IAS 12 may well differ from that of the acquired entity. For example, the acquired entity might have intended to recover an asset through use, whereas the acquirer intends to sell it. In such a case, in our view, the requirement of IFRS 3 to recognise and measure deferred tax in accordance with IAS 12 has the effect that the expectations of the acquirer are used to determine the tax base of an item and the measurement of any deferred tax associated with the item.

12.1.1.A Changes in tax base consequent on the business combination

In some jurisdictions, a business combination may provide the opportunity to revise the tax base of an asset to an amount equal to the fair value assigned to it in accounting for the business combination. Most significantly, this may include the ability to create a tax base for an intangible asset or goodwill which may have had no tax base at all for the acquiree.

In some cases, the increase (as it generally is) in tax base may be more or less automatic. In others, the taxpayer may be required to make a formal claim or election for the increase to the tax authority. Sometimes further restructuring may be required – for example, it may be necessary for the business of the acquired entity to be transferred to another entity in the acquirer's group in the same tax jurisdiction.

An increase in a tax base that requires action by the relevant entity after the acquisition (such as making a claim or election or undertaking a restructuring) occurs after the business combination. However, some hold the view that the ability to increase a tax base following a business combination is a benefit that is taken into account by an informed buyer in negotiating the purchase price. Accordingly, it is argued, the increase is most appropriately reflected by adjusting the tax base of assets acquired as at the date of the business combination as if the increase had occurred at that date. This reduces any deferred tax liability and, therefore, reduces any goodwill (or increases any 'bargain purchase' gain).

Those who support this view note that, if the increase in tax base is accounted for only when it legally occurs in the post-combination period, the net effect is to increase goodwill and reduce post-combination tax expense when in reality the entity may have done little more than fill in a form. It might also be difficult to sustain the higher carrying amount of goodwill arising from this treatment.

We believe that it is generally appropriate to anticipate an increase to a tax base that legally occurs following a business combination in accounting for the business combination where the increase:

- is automatic or requires only a notification to the tax authority;
- requires an application to the tax authority that is not normally refused for transactions of a comparable nature; or
- is contingent on some post-acquisition restructuring, where this can be done without substantial difficulty.

Conversely, we believe that it would not generally be appropriate to account for an increase in a tax base until it occurs where the increase:

- relies on 'bespoke' tax planning that may be challenged by the tax authority;
- requires an application to the tax authority that in practice is frequently and successfully challenged for transactions of a comparable nature; or
- is contingent on some post-acquisition restructuring, where this will involve a substantial process, such as obtaining approval from regulators, unions, pension fund trustees etc.

12.1.2 Deferred tax assets arising on a business combination

12.1.2.A Assets of the acquirer

If, as a result of a business combination, the acquiring entity is able to recognise a previously unrecognised tax asset of its own (e.g. unused tax losses), the recognition of the asset is accounted for as income, and not as part of the accounting for the business combination. *[IAS 12.67]*.

12.1.2.B Assets of the acquiree

It may be the case that deferred tax assets of an acquired entity do not meet the recognition criteria of IAS 12 from the perspective of the acquired entity, but do meet the criteria from the perspective of the acquirer. In such cases, the general principles of IAS 12 require the acquirer's perspective to be applied as at the date of the business combination.

The potential benefit of the acquiree's income tax loss carryforwards or other deferred tax assets may not satisfy the criteria for separate recognition when a business combination is initially accounted for but may be realised subsequently. Any changes in recognised deferred tax assets of an acquired entity are accounted for as follows:

- Acquired deferred tax benefits recognised within the measurement period (see Chapter 9 at 5.6.2) that result from new information about facts and circumstances that existed at the acquisition date are applied to reduce the carrying amount of any goodwill related to that acquisition. If the carrying amount of that goodwill is zero, any remaining deferred tax benefits are recognised in profit or loss.
- All other acquired deferred tax benefits realised are recognised in profit or loss (or outside profit or loss if IAS 12 so requires – see 10 above). *[IAS 12.68]*.

12.1.3 Deferred tax liabilities of acquired entity

IAS 12 contains no specific provisions regarding the recognition of a deferred tax liability of an acquired entity after the date of the original combination. The recognition of such liabilities should therefore be accounted for in accordance with the normal rules of IAS 12 (i.e. in the period in which the liability arises), unless either:

- the recognition of the liability occurs within the provisional measurement period for the business combination and reflects new information about facts and circumstances that existed at the acquisition date, in which case the acquisition date value of the liability is retrospectively adjusted – see Chapter 9 at 12; or
- the failure to recognise the liability at the time of the combination was an error, in which case the provisions of IAS 8 should be applied – see Chapter 3 at 4.6.

12.2 Tax deductions for replacement share-based payment awards in a business combination

IFRS 3 contains some guidance on the treatment of tax deductions for share-based payment transactions made by an acquirer as a replacement for awards made by the acquired entity before the business combination. This is discussed in more detail at 10.8.5 above.

12.3 Apparent immediate impairment of goodwill created by deferred tax

The requirement of IAS 12 to recognise deferred tax on all temporary differences arising on net assets acquired in a business combination leads to the creation of goodwill which, on a literal reading of IAS 36 may then be required to be immediately impaired, as illustrated by Example 33.59 below.

Example 33.59: Apparent 'day one' impairment arising from recognition of deferred tax in a business combination

Entity A, which is taxed at 40%, acquires Entity B for €100m in a transaction that is a business combination. The fair values and tax bases of the identifiable net assets of Entity B are as follows:

	Fair value €m	*Tax base* €m
Brand name	60	–
Other net assets	20	15

This will give rise to the following consolidation journal:

	€m	€m
Goodwill (balance)	46	
Brand name	60	
Other net assets	20	
Deferred tax[1]		26
Cost of investment		100

[1] 40% of (€[60m + 20m] – €15m)

The fair value of the consolidated assets of the subsidiary (excluding deferred tax) and goodwill is now €126m, but the cost of the subsidiary is only €100m. Clearly €26m of the goodwill arises solely from the recognition of deferred tax. However, IAS 36, paragraph 50, explicitly requires tax to be excluded from the estimate of future cash flows used to calculate any impairment. This raises the question of whether there should be an immediate impairment write-down of the assets to €100m. In our view, this cannot have been the intention of IAS 36 (see the further discussion in Chapter 20 at 8.3.1).

12.4 Tax deductions for acquisition costs

Under IFRS 3 transaction costs are required to be expensed. However, in a number of jurisdictions, transaction costs are regarded as forming part of the cost of the investment for tax purposes, with the effect that a tax deduction for them is given only when the investment is subsequently sold or otherwise disposed of, rather than at the time that the costs are charged to profit or loss.

In such jurisdictions, there will be a deductible 'outside' temporary difference (see 7.5 above) between the carrying value of the net assets and goodwill of the acquired entity in the consolidated financial statements (which will exclude transaction costs) and tax base of the investment in the entity (which will include transaction costs). Whether or not a deferred tax asset is recognised in respect of such a deductible temporary difference will be determined in accordance with the general provisions of IAS 12 for deductible temporary differences (see 7.5.3 above).

In the separate financial statements of the acquirer, there may be no temporary difference where the transaction costs are, under IAS 27, included in the cost of the investment.

12.5 Temporary differences arising from the acquisition of a group of assets that is not a business

Although the acquisition of an asset or a group of assets that do not constitute a business is not within the scope of IFRS 3, in such cases the acquirer has to identify and recognise the individual identifiable assets acquired (including intangible assets) and liabilities assumed. The cost of the group is allocated to the individual identifiable assets and liabilities on the basis of their relative fair values at the date of purchase. These transactions or events do not give rise to goodwill. *[IFRS 3.2(b)]*. Temporary differences may therefore arise because the new carrying value of each acquired asset and liability could be changed without any equivalent adjustment for tax purposes.

However, in these circumstances the acquirer cannot account for any deferred tax assets or deferred tax liabilities, resulting from temporary differences identified. Since the acquisition does not constitute a business combination, the initial recognition exception applies as discussed at 7.2 above. Indeed, the application of the IRE would mean that no deferred tax is recognised by an acquiring entity, either on initial recognition or subsequently, for any temporary differences related to the 'tax history' of the related assets and liabilities (i.e. in relation to differences between their carrying values before their transfer and their tax base). Furthermore, an entity does not recognise subsequent changes in the unrecognised deferred tax liability or asset as the asset is depreciated. *[IAS 12.22(c)]*.

The requirements of IFRS 3 in relation to the acquisition of an asset or a group of assets that does not constitute a business is discussed in Chapter 9 at 2.2.2.

13 PRESENTATION

13.1 Statement of financial position

Tax assets and liabilities should be shown separately from other assets and liabilities and current tax should be shown separately from deferred tax on the face of the statement of financial position. Where an entity presents current and non-current assets and liabilities separately, deferred tax should not be shown as part of current assets or liabilities. *[IAS 1.54-56]*.

13.1.1 Offset

13.1.1.A Current tax

Current tax assets and liabilities should be offset if, and only if, the entity:

- has a legally enforceable right to set off the recognised amounts; and
- intends either to settle them net or simultaneously. *[IAS 12.71]*.

These requirements are based on the offset criteria in IAS 32 for financial instruments. The phrase 'if and only if' means that offset is required if both the above conditions are met, but prohibited if they are not both met. Accordingly, while entities in many jurisdictions have a right to offset current tax assets and liabilities, and the tax authority permits the entity to make or receive a single net payment, IAS 12 permits offset in financial statements only where there is a positive intention for simultaneous net settlement. *[IAS 12.72]*.

The offset requirements in IAS 12 also have the effect that, in consolidated financial statements, a current tax asset of one member of the group is offset against a current tax liability of another, if and only if the two group members have a legally enforceable right to make or receive a single net payment and a positive intention to recover the asset or settle the liability simultaneously. *[IAS 12.73]*.

13.1.1.B Deferred tax

Deferred tax assets and liabilities should be offset if, and only if:

- the entity has a legally enforceable right to set off current tax assets against current liabilities; and
- the deferred tax assets and liabilities concerned relate to income taxes raised by the same taxation authority on either:
  - the same taxable entity; or
  - different taxable entities which intend, in each future period in which significant amounts of deferred tax are expected to be settled or recovered, to settle their current tax assets and liabilities either on a net basis or simultaneously. *[IAS 12.74]*.

The phrase 'if and only if' means that offset is required if both the above conditions are met, but prohibited if they are not both met.

The position is that where in a particular jurisdiction current tax assets and current tax liabilities relating to future periods will be offset under the requirements set out at 13.1.1.A above, deferred tax assets and liabilities relating to that jurisdiction and those periods must also be offset.

This requirement was adopted in order to avoid the need for detailed scheduling of the reversal of temporary differences that would otherwise have been necessary to determine whether taxable temporary differences and deductible temporary differences would reverse in the same periods (and therefore be eligible for offset in their own right). *[IAS 12.75]*.

However, IAS 12 notes that, in rare circumstances, an entity may have a legally enforceable right of set-off, and an intention to settle net, for some periods but not for others. In such circumstances, detailed scheduling may be required to establish reliably whether the deferred tax liability of one taxable entity in the group will result in increased tax payments in the same period in which a deferred tax asset of a second taxable entity in the group will result in decreased payments by that second taxable entity. *[IAS 12.76]*.

13.1.1.C No offset of current and deferred tax

IAS 12 contains no provisions allowing or requiring the offset of current tax and deferred tax. Also, as noted at 13.1 above, IAS 1 requires tax assets and liabilities to be shown separately from other assets and liabilities and current tax to be shown separately from deferred tax on the face of the statement of financial position. *[IAS 1.54(n), 54(o)]*. Accordingly, in our view, current and deferred tax may not be offset against each other and should always be presented gross.

13.2 Statement of comprehensive income

The tax expense (or income) related to profit or loss from ordinary activities should be presented as a component of profit or loss in the statement of comprehensive income. *[IAS 12.77]*.

The results of discontinued operations should be presented on a post-tax basis. *[IFRS 5.33]*. This is discussed further in Chapter 4 at 3.2.

The results of equity-accounted entities should be presented on a post-tax basis. *[IAS 1.IG6]*. Any income tax relating to a 'tax-transparent' equity-accounted entity (see 7.6 above) forms part of the investor's tax charge. It is therefore included in the income tax line in profit or loss and not shown as part of the investor's share of the results of the tax-transparent entity.

Entities are required to disclose the amount of income tax relating to each item of other comprehensive income, including reclassification adjustments, either in the statement of profit or loss and other comprehensive income or in the notes. *[IAS 1.90]*. Components of other comprehensive income may be presented either:

- net of related tax effects; or
- before related tax effects with one amount shown for the total income tax effects relating to the items that might be reclassified subsequently to profit and loss and another amount shown for the total income tax effects relating to those items that will not be subsequently reclassified to profit and loss. *[IAS 1.91]*.

IAS 12 notes that, whilst IAS 21 requires certain exchange differences to be recognised within income or expense, it does not specify where exactly in the statement of comprehensive income they should be presented. Accordingly, exchange differences relating to deferred tax assets and liabilities may be classified as deferred tax expense (or income), if that presentation is considered to be the most useful to users of the financial statements. *[IAS 12.78]*. IAS 12 makes no reference to the treatment of exchange differences on current tax assets and liabilities but, presumably, the same considerations apply.

13.3 Statement of cash flows

Cash flows arising from taxes on income are separately disclosed and classified as cash flows from operating activities, unless they can be specifically identified with financing and investing activities. *[IAS 7.35]*.

IAS 7 – *Statement of Cash Flows* – notes that, whilst it is relatively easy to identify the expense relating to investing or financing activities, the related tax cash flows are often impracticable to identify. Therefore, taxes paid are usually classified as cash flows from operating activities. However, when it is practicable to identify the tax cash flow with an individual transaction that gives rise to cash flows that are classified as investing or financing activities, the tax cash flow is classified as an investing or financing activity as appropriate. When tax cash flows are allocated over more than one class of activity, the total amount of taxes paid is disclosed. *[IAS 7.36]*.

14 DISCLOSURE

IAS 12 imposes extensive disclosure requirements as follows.

14.1 Components of tax expense

The major components of tax expense (or income) should be disclosed separately. These may include:

(a) current tax expense (or income);

(b) any adjustments recognised in the period for current tax of prior periods;

(c) the amount of deferred tax expense (or income) relating to the origination and reversal of temporary differences;

(d) the amount of deferred tax expense (or income) relating to changes in tax rates or the imposition of new taxes;

(e) the amount of the benefit arising from a previously unrecognised tax loss, tax credit or temporary difference of a prior period that is used to reduce current tax expense;

(f) the amount of the benefit from a previously unrecognised tax loss, tax credit or temporary difference of a prior period that is used to reduce deferred tax expense;

(g) deferred tax expense arising from the write-down, or reversal of a previous write-down, of a deferred tax asset; and

(h) the amount of tax expense (or income) relating to those changes in accounting policies and errors which are included in the profit or loss in accordance with IAS 8 because they cannot be accounted for retrospectively (see Chapter 3 at 4.7). *[IAS 12.79-80]*.

14.2 Other disclosures

The following should also be disclosed separately: *[IAS 12.81]*

(a) the aggregate current and deferred tax relating to items that are charged or credited to equity;

(b) the amount of income tax relating to each component of other comprehensive income; The analysis in (b) can be provided either in the statement of profit or loss and other comprehensive income or in the notes; *[IAS 1.90]*

(c) an explanation of the relationship between tax expense (or income) and accounting profit in either or both of the following forms:

  (i) a numerical reconciliation between tax expense (or income) and the product of accounting profit multiplied by the applicable tax rate(s), disclosing also the basis on which the applicable tax rate(s) is (are) computed; or

  (ii) a numerical reconciliation between the average effective tax rate (i.e. tax expense (or income) divided by accounting profit), *[IAS 12.86]*, and the applicable tax rate, disclosing also the basis on which the applicable tax rate is computed;

  This requirement is discussed further at 14.2.1 below.

(d) an explanation of changes in the applicable tax rate(s) compared to the previous accounting period;

(e) the amount (and expiry date, if any) of deductible temporary differences, unused tax losses, and unused tax credits for which no deferred tax asset is recognised in the statement of financial position;

(f) the aggregate amount of temporary differences associated with investments in subsidiaries, branches and associates and interests in joint arrangements, for which deferred tax liabilities have not been recognised;

  This is discussed further at 14.2.2 below.

(g) in respect of each type of temporary difference, and in respect of each type of unused tax losses and unused tax credits:

  (i) the amount of the deferred tax assets and liabilities recognised in the statement of financial position for each period presented; and

  (ii) the amount of the deferred tax income or expense recognised in profit or loss, if this is not apparent from the changes in the amounts recognised in the statement of financial position;

  The analysis in (ii) will be required, for example, by any entity with acquisitions and disposals, or deferred tax accounted for in other comprehensive income or equity, since this will have the effect that the year-on-year movement in the statement of financial position is not solely due to items recognised in profit or loss;

(h) in respect of discontinued operations, the tax expense relating to:
   (i) the gain or loss on discontinuance; and
   (ii) the profit or loss from the ordinary activities of the discontinued operation for the period, together with the corresponding amounts for each prior period presented;

(i) the amount of income tax consequences of dividends to shareholders of the entity that were proposed or declared before the financial statements were authorised for issue, but are not recognised as a liability in the financial statements.

   Further disclosures are required in respect of the tax consequences of distributing retained earnings, which are discussed at 14.4 below;

(j) if a business combination in which the entity is the acquirer causes a change in the amount of a pre-acquisition deferred tax asset of the entity (see 12.1.2 above), the amount of that change; and

(k) if the deferred tax benefits acquired in a business combination are not recognised at the acquisition date, but are recognised after the acquisition date (see 12.1.2 above), a description of the event or change in circumstances that caused the deferred tax benefits to be recognised.

Tax-related contingent liabilities and contingent assets (such as those arising from unresolved disputes with taxation authorities) are disclosed in accordance with IAS 37 (see 9.6 above and Chapter 26 at 7). *[IAS 12.88]*.

Significant effects of changes in tax rates or tax laws enacted or announced after the reporting period on current and deferred tax assets and liabilities are disclosed in accordance with IAS 10 (see Chapter 38 at 2). *[IAS 12.88]*.

14.2.1 Tax (or tax rate) reconciliation

IAS 12 explains that the purpose of the tax reconciliation required by (c) above is to enable users of financial statements to understand whether the relationship between tax expense (or income) and accounting profit is unusual and to understand the significant factors that could affect that relationship in the future. The relationship may be affected by the effects of such factors as:

- revenue and expenses that are outside the scope of taxation;
- tax losses; and
- foreign tax rates. *[IAS 12.84]*.

Accordingly, in explaining the relationship between tax expense (or income) and accounting profit, an entity should use an applicable tax rate that provides the most meaningful information to the users of its financial statements.

Often, the most meaningful rate is the domestic rate of tax in the country in which the entity is domiciled. In this case, the tax rate applied for national taxes should be aggregated with the rates applied for any local taxes which are computed on a substantially similar level of taxable profit (tax loss). However, for an entity operating in several jurisdictions, it may be more meaningful to aggregate separate reconciliations prepared using the domestic rate in each individual jurisdiction. *[IAS 12.85]*. Where this latter approach is adopted, the entity may need to discuss the effect of significant changes in either tax rates, or the mix of profits earned in different jurisdictions, in order to satisfy the requirement of IAS 12 to explain changes in the applicable tax rate(s) compared to the previous accounting period – see item (d) at 14.2 above.

Example 33.60 illustrates how the selection of the applicable tax rate affects the presentation of the numerical reconciliation.

Example 33.60: Alternative presentations of tax reconciliation

In 2021 an entity has accounting profit of €3,000m (2020: €2,500m) comprising €1,500m (2020: €2,000m) in its own jurisdiction (country A) and €1,500m (2020: €500m) in country B. The tax rate is 30% in country A and 20% in country B. In country B, expenses of €200m (2020: €100m) are not deductible for tax purposes. There are no other differences between accounting profit and profit that is subject to current tax, or on which deferred tax has been provided for under IAS 12.

Thus the accounting tax charge in the financial statements for each period will be as follows:

	2021 €m	2020 €m
Country A		
€1,500m/€2,000m @ 30%	450	600
Country B		
€[1,500 + 200]m/€[500 + 100]m @ 20%	340	120
Total tax charge	790	720

Reconciliation based on A's domestic tax rate

If the entity presents a tax reconciliation based on its own (i.e. country A's) domestic tax rate, the following presentation would be adopted.

	2021 €m	2020 €m
Accounting profit	3,000	2,500
Tax at domestic rate of 30%	900	750
Effect of:		
Expenses not deductible for tax purposes[1]	60	30
Overseas tax rates[2]	(170)	(60)
Tax expense	790	720

[1] €200m/€100m @ 30%

[2] B's taxable profit €1,700m/€600m @ (20% – 30%)

Reconciliation based on each jurisdiction's tax rate

If the entity presents a tax reconciliation based on each jurisdiction's domestic tax rate, the following presentation would be adopted.

	2021 €m	2020 €m
Accounting profit	3,000	2,500
Tax at domestic rates applicable to individual group entities[1]	750	700
Effect of:		
Expenses not deductible for tax purposes[2]	40	20
Tax expense	790	720

[1] 2021: A = €450m [€1,500m @ 30%], B = €300m [€1,500m @ 20%], total €750m
2020: A = €600m [€2,000m @ 30%], B = €100m [€500m @ 20%], total €700m

[2] €200m/€100m @ 20%

14.2.2 Temporary differences relating to subsidiaries, associates, branches and joint arrangements

IAS 12 requires an entity to disclose the gross temporary differences associated with subsidiaries, associates, branches and joint arrangements for which a deferred tax liability is not recognised, as opposed to the unrecognised deferred tax on those temporary differences – see (f) under 14.2 above.

IAS 12 clarifies that this approach is adopted because it would often be impracticable to compute the amount of unrecognised deferred tax. Nevertheless, where practicable, entities are encouraged to disclose the amounts of the unrecognised deferred tax liabilities because financial statement users may find such information useful. *[IAS 12.87]*.

14.3 Reason for recognition of particular tax assets

Separate disclosure is required of the amount of any deferred tax asset that is recognised, and the nature of the evidence supporting its recognition, when:

(a) utilisation of the deferred tax asset is dependent on future profits in excess of those arising from the reversal of deferred tax liabilities; and

(b) the entity has suffered a loss in the current or preceding period in the tax jurisdiction to which the asset relates. *[IAS 12.82]*.

In effect these disclosures are required when the entity has rebutted the presumption inherent in the recognition rules of IAS 12 that tax assets should not normally be recognised in these circumstances (see 7.4 above).

14.4 Dividends

As discussed at 8.5 above, where there are different tax consequences for an entity depending on whether profits are retained or distributed, tax should be measured at the rates applicable to retained profits except to the extent that there is a liability to pay dividends at the end of the reporting period, where the rate applicable to distributed profits should be used.

Where such differential tax rates apply, the entity should disclose the nature of the potential income tax consequences that would arise from a payment of dividends to shareholders. It should quantify the amount of potential income tax consequences that is practicably determinable and disclose whether there are any potential income tax consequences that are not practicably determinable. *[IAS 12.82A]*. This will include disclosure of the important features of the income tax systems and the factors that will affect the amount of the potential income tax consequences of dividends. *[IAS 12.87A]*.

The reason for this rather complicated requirement is that, as IAS 12 acknowledges, it can often be very difficult to quantify the tax consequences of a full distribution of profits (e.g. where there are a large number of overseas subsidiaries). Moreover, IAS 12 concedes that there is a tension between, on the one hand, the exemption from disclosing the deferred tax associated with temporary differences associated with subsidiaries and other investments (see 14.2.2 above) and, on the other hand, this requirement to disclose the tax effect of distributing undistributed profits – in some cases they could effectively be the same number.

However, to the extent that any liability can be quantified, it should be disclosed. This may mean that consolidated financial statements will disclose the potential tax effect of distributing the earnings of some, but not all, subsidiaries, associates, branches and joint arrangements.

IAS 12 emphasises that, in an entity's separate financial statements, this requirement applies only to the undistributed earnings of the entity itself and not those of any of its subsidiaries, associates, branches and joint arrangements. *[IAS 12.87A-87C]*.

14.5 Examples of disclosures

In Extract 33.1 below, Royal Dutch Shell sets out the components of the tax expense and provides a reconciliation of the tax charge in the income statement. *[IAS 12.79-80, 81(c)]*.

Extract 33.1: Royal Dutch Shell plc (2019)

Notes to the Consolidated Financial Statements [extract]

16 – TAXATION [extract]

Taxation charge

	2019	2018	$ million 2017
Current tax:			
Charge in respect of current period	7,597	10,415	7,204
Adjustments in respect of prior periods	(1)	60	(613)
Total	7,596	10,475	6,591
Deferred tax:			
Relating to the origination and reversal of temporary differences, tax losses and credits	1,377	1,438	(4,102)
Relating to changes in tax rates and legislation	(67)	(157)	2,004[A]
Adjustments in respect of prior periods	147	(41)	202
Total	1,457	1,240	(1,896)
Total taxation charge	9,053	11,715	4,695

[A] Mainly in respect of the US Tax Cuts and Jobs Act.

Adjustments in respect of prior periods relate to events in the current period and reflect the effects of changes in rules, facts or other factors compared with those used in establishing the current tax position or deferred tax balance in prior periods.

Reconciliation of applicable tax charge at statutory tax rates to taxation charge

	2019	2018	$ million 2017
Income before taxation	25,485	35,621	18,130
Less: share of profit of joint ventures and associates	(3,604)	(4,106)	(4,225)
Income before taxation and share of profit of joint ventures and associates	21,881	31,515	13,905
Applicable tax charge at standard statutory tax rates [A]	7,214	11,641	4,709
Adjustments in respect of prior periods	146	19	(411)
Tax effects of: [B]			
Expenses not deductible for tax purposes	1,493	1,176	1,000
Derecognition/(recognition) of deferred tax assets	846	(381)	(957)
Incentives for investment and development [A]	(757)	(557)	(527)
Disposals	(235)	(524)	(910)
Income not subject to tax at standard statutory rates	159	(286)	(359)
Changes in tax rates and legislation	(67)	(157)	2,004
Exchange rate differences	(34)	623	320
Other reconciling items	288	161	(174)
Taxation charge	9,053	11,715	4,695

[A] Incentives for investment and development include conditional preferential tax rates to attract investment, uplift on carried forward losses and capital expenditure, investment tax allowances and credits for research and development. Up to and including 2018, preferential tax rates were reported within the applicable tax charge at standard statutory tax rates. Comparative numbers for 2018 and 2017 were reclassified to conform with the current year presentation.

[B] The tax effect categories have changed to provide better insights. Comparative numbers for 2018 and 2017 were reclassified to conform with the current year presentation.

The weighted average of statutory tax rates was 33% in 2019 (2018: 37% as revised; 2017: 34% as revised). Compared with 2018, the decrease in the rate reflects a higher proportion of earnings in the Downstream and Integrated Gas segments, subject to relatively lower tax rates than earnings in the Upstream segment. In addition, a higher proportion of Integrated Gas income was earned in countries with relatively lower statutory tax rates.

In Extract 33.2 below, BP p.l.c. provides an analysis of deferred tax income or expense recognised in profit or loss and the amount of the deferred tax assets and liabilities recognised in the statement of financial position. *[IAS 12.81(g)]*.

Extract 33.2: BP p.l.c. (2018)

Notes on financial statements [extract]

9. **Taxation** [extract]

Deferred tax [extract]

The following table provides an analysis of deferred tax in the income statement and the balance sheet by category of temporary difference:

$ million

	Income statement[a,b]			Balance sheet[a,b]	
	2019	2018	2017	**2019**	2018
Deferred tax liability					
Depreciation	**(1,436)**	(1,297)	(3,971)	**22,627**	22,565
Pension plan surpluses	**(31)**	65	(12)	**2,290**	1,956
Derivative financial instruments	**29**	(36)	(27)	**29**	–
Other taxable temporary differences	**159**	(57)	(64)	**1,496**	1,224
	(1,279)	(1,325)	(4,074)	**26,442**	25,745
Deferred tax asset					
Lease liabilities	**264**	8	(16)	**(1,380)**	(90)
Pension plan and other post-retirement benefit plan deficits	**62**	(6)	340	**(1,367)**	(1,319)
Decommissioning, environmental and other provisions	**(472)**	1,505	3,503	**(7,579)**	(7,126)
Derivative financial instruments	**63**	(31)	(47)	**(24)**	(95)
Tax credits	**(336)**	123	1,476	**(3,964)**	(3,626)
Loss carry forward	**12**	559	(964)	**(5,834)**	(5,900)
Other deductible temporary differences	**402**	316	(772)	**(1,104)**	(1,483)
	(5)	2,474	3,520	**(21,252)**	(19,639)
Net deferred tax charge (credit) and net deferred tax liability[c]	**(1,284)**	1,149	(554)	**5,190**	6,106
Of which – deferred tax liabilities				**9,750**	9,812
– deferred tax assets				**4,560**	3,706

[a] The 2017 and 2018 income statement and 2018 balance sheet are impacted by the reduction in US federal corporate income tax rate from 35% to 21%, effective from 1 January 2018.

[b] The 2019 balance sheet is impacted by the adoption of IFRS 16 and minor amendments have been made to the balance sheet and income statement comparatives to align with current period presentation.

[c] Included within the net deferred tax liability is a deferred tax asset balance of $5,526 million (2018 $5,562 million) related to the Gulf of Mexico oil spill.

Of the $4,560 million of deferred tax assets recognised on the group balance sheet at 31 December 2019 (2018 $3,706 million), $2,421 million (2018 $2,758 million) relates to entities that have suffered a loss in either the current or preceding period. This amount is supported by forecasts that indicate sufficient future taxable profits will be available to utilize such assets. For 2019, $2,421 million relates to the US (2018 $1,563 million relates to the US and $1,108 million relates to India).

In Extract 33.3 below, Hochschild Mining describes the general nature of its tax-related contingent liabilities relating to fiscal periods that are still open to review by the tax authorities and quantifies its estimate of the possible total exposure to tax assessments. *[IAS 12.88]*.

Extract 33.3: Hochschild Mining PLC (2019)

NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]

34 Contingencies [extract]

(a) Taxation

Fiscal periods remain open to review by the tax authorities for four years in Peru, five years in Argentina and Mexico and three years in Chile, preceding the year of review. During this time the authorities have the right to raise additional tax assessments including penalties and interest. Under certain circumstances, reviews may cover longer periods.

Because a number of fiscal periods remain open to review by the tax authorities, coupled with the complexity of the Group and the transactions undertaken by it, there remains a risk that significant additional tax liabilities may arise. As at 31 December 2019, the Group had exposures totalling US$29,334,000 (2018: US$26,345,000) which are assessed as 'possible', rather than 'probable'. No amounts have been provided in respect of these items. This predominantly relates to potential tax penalties and related interest on intercompany loans.

Notwithstanding this risk, the Directors believe that management's interpretation of the relevant legislation and assessment of taxation is appropriate and that it is probable that the Group's tax and customs positions will be sustained in the event of a challenge by the tax authorities. Consequently, the Directors consider that they have made adequate provision for any future outflow of resources and no additional provision is required in respect of these claims or risks.

The disclosures in Extract 33.4 below include information about deductible temporary differences, unused tax losses and unused tax credits in respect of which no deferred tax asset has been recognised, together with details of the aggregate amount of temporary differences associated with its investments in subsidiaries and equity-accounted entities for which deferred tax liabilities have not been recognised. *[IAS 12.81(e), 81(f)]*.

Extract 33.4: BP p.l.c. (2018)

Notes on financial statements [extract]

9. Taxation [extract]

Deferred tax [extract]

A summary of temporary differences, unused tax credits and unused tax losses for which deferred tax has not been recognized is shown in the table below.

		$ billion	
At 31 December		**2019**	2018
Unused US state tax losses[a]		**2.3**	6.6
Unused tax losses – other jurisdictions[b]		**3.5**	4.3
Unused tax credits		**25.4**	22.5
of which	– arising in the UK[c]	**21.5**	18.7
	– arising in the US[d]	**3.9**	3.8
Deductible temporary differences[e]		**40.4**	37.3
Taxable temporary differences associated with investments in subsidiaries and equity-accounted entities		**1.5**	1.5

[a] For 2019 these losses expire in the period 2020–2039 with applicable tax rates ranging from 3% to 12%.

[b] The majority of the unused tax losses have no fixed expiry date.

[c] The UK unused tax credits arise predominantly in overseas branches of UK entities based in jurisdictions with higher statutory corporate income tax rates than the UK. No deferred tax asset has been recognized on these tax credits as they are unlikely to have value in the future; UK taxes on these overseas branches are largely mitigated by double tax relief in respect of overseas tax. These tax credits have no fixed expiry date.

[d] For 2019 the US unused tax credits expire in the period 2020-2029.

[e] The majority comprises fixed asset temporary differences in the UK. Substantially all of the temporary differences have no expiry date.

Impact of previously unrecognized deferred tax or write-down of deferred tax assets on tax charge	$ million **2019**	 2018	 2017
Current tax benefit relating to the utilization of previously unrecognized deferred tax assets	**272**	83	22
Deferred tax benefit arising from the reversal of a previous write-down of deferred tax assets	**96**	–	–
Deferred tax benefit relating to the recognition of previously unrecognized deferred tax assets	**364**	112	436
Deferred tax expense arising from the write-down of a previously recognized deferred tax asset	**73**	169	78

14.6 Discontinued operations – interaction with IFRS 5

IFRS 5 requires the post-tax results of discontinued operations to be shown separately on the face of the statement of comprehensive income (and any separate income statement presenting the components of profit or loss). This may be done by giving the results of discontinued operations after those of continuing operations. This is discussed further in Chapter 4.

The definitions of income tax, tax expense and taxable profit in IAS 12 (see 3 above) do not distinguish between the results of continuing and discontinued operations, or the tax on those results. Thus, as drafted, IAS 12 applies not only to the tax income or expense on continuing operations (i.e. the amount shown in the 'tax line' in the income statement) but also to any tax income or expense relating to the results of discontinued operations separately disclosed after those of continuing operations.

However, IFRS 5 clarifies that items accounted for under that standard are not subject to the disclosure requirements of other standards, other than:

- specific disclosures in respect of non-current assets (or disposal groups) classified as held for sale or discontinued operations; or
- disclosures about the measurement of assets and liabilities within a disposal group that are not within the scope of the measurement requirements of IFRS 5, where such disclosures are not already provided in the other notes to the financial statements. *[IFRS 5.5B]*.

5.3.9 'Good leaver' arrangements 2687
5.3.9.A Provision for 'good leavers' made in original terms of award 2687
5.3.9.B Discretionary awards to 'good leavers' 2688
5.3.9.C Automatic full or pro rata entitlement on leaving employment 2689
5.3.10 Special purpose acquisition companies ('SPACs') 2690
5.4 Transactions with non-employees 2691
5.4.1 Effect of change of status from employee to non-employee (or vice versa) 2691
5.5 Determining the fair value of equity instruments 2692
5.5.1 Reload features 2693
6 EQUITY-SETTLED TRANSACTIONS – ALLOCATION OF EXPENSE 2693
6.1 Overview 2693
6.1.1 The continuous estimation process of IFRS 2 2694
6.1.2 Vesting and forfeiture 2695
6.1.3 Accounting after vesting 2696

- 6.2 Vesting conditions other than market conditions.......... 2696
  - 6.2.1 Awards with service conditions.......... 2696
  - 6.2.2 Equity instruments vesting in instalments ('graded' vesting).......... 2697
  - 6.2.3 Transactions with variable vesting periods due to non-market performance vesting conditions.......... 2699
  - 6.2.4 Transactions with variable number of equity instruments awarded depending on non-market performance vesting conditions.......... 2701
  - 6.2.5 Transactions with variable exercise price due to non-market performance vesting conditions.......... 2702
- 6.3 Market conditions.......... 2703
  - 6.3.1 What is a 'market condition'?.......... 2703
  - 6.3.2 Summary of accounting treatment.......... 2704
  - 6.3.3 Transactions with market conditions and known vesting periods.......... 2707
  - 6.3.4 Transactions with variable vesting periods due to market conditions.......... 2708
  - 6.3.5 Transactions with multiple outcomes depending on market conditions.......... 2709
  - 6.3.6 Transactions with independent market conditions, non-market vesting conditions or non-vesting conditions.......... 2710
    - 6.3.6.A Independent market and non-market vesting conditions.......... 2710
    - 6.3.6.B Independent market conditions and non-vesting conditions.......... 2711
  - 6.3.7 Transactions with hybrid or interdependent market conditions and non-market vesting conditions.......... 2711
  - 6.3.8 Awards with a condition linked to flotation price.......... 2712
- 6.4 Non-vesting conditions.......... 2712
  - 6.4.1 Awards with no conditions other than non-vesting conditions.......... 2712
  - 6.4.2 Awards with non-vesting conditions and variable vesting periods.......... 2713
  - 6.4.3 Failure to meet non-vesting conditions.......... 2713

7 EQUITY-SETTLED TRANSACTIONS – MODIFICATION, CANCELLATION AND SETTLEMENT.......... 2714

- 7.1 Background.......... 2714
- 7.2 Valuation requirements when an award is modified, cancelled or settled.......... 2715
- 7.3 Modification.......... 2716
  - 7.3.1 Modifications that increase the value of an award.......... 2717
    - 7.3.1.A Increase in fair value of equity instruments granted.......... 2717

7.3.1.B Increase in number of equity instruments granted 2718

7.3.1.C Removal or mitigation of non-market vesting conditions 2718

7.3.2 Modifications that decrease the value of an award 2719

7.3.2.A Decrease in fair value of equity instruments granted 2720

7.3.2.B Decrease in number of equity instruments granted 2721

7.3.2.C Additional or more onerous non-market vesting conditions 2721

7.3.3 Modifications with altered vesting period 2722

7.3.4 Modifications that reduce the number of equity instruments granted but maintain or increase the value of an award (‘value for value’ exchanges and ‘give and take’ modifications) 2724

7.3.5 Modification of award from equity-settled to cash-settled (and vice versa) 2726

7.4 Cancellation and settlement 2726

7.4.1 Distinction between cancellation and forfeiture 2727

7.4.1.A Termination of employment by entity 2727

7.4.1.B Surrender of award by employee 2727

7.4.2 Distinction between cancellation and modification 2728

7.4.3 Calculation of the expense on cancellation 2728

7.4.4 Replacement awards 2730

7.4.4.A Designation of award as replacement award 2730

7.4.4.B Incremental fair value of replacement award 2731

7.4.4.C Replacement of vested awards 2734

7.5 Replacement and *ex gratia* awards on termination of employment 2734

7.6 Entity’s plans for future modification or replacement of award – impact on estimation process at reporting date 2736

7.7 Two awards running ‘in parallel’ 2737

7.8 Share splits and consolidations 2738

8 EQUITY-SETTLED TRANSACTIONS – VALUATION 2739

8.1 Introduction 2739

8.2 Options 2740

8.2.1 Call options – overview 2740

8.2.2 Call options – valuation 2741

8.2.3 Factors specific to employee share options 2742

8.2.3.A Non-transferability 2743

8.2.3.B Continued employment requirement 2743

- 8.2.3.C Vesting and non-vesting conditions 2743
- 8.2.3.D Periods during which exercise is restricted 2743
- 8.2.3.E Limited ability to hedge option values 2743
- 8.2.3.F Dilution effects 2744

8.3 Selection of an option-pricing model 2744
- 8.3.1 The Black-Scholes-Merton formula 2745
- 8.3.2 The binomial model 2747
  - 8.3.2.A Lattice models – number of time steps 2750
- 8.3.3 Monte Carlo Simulation 2751

8.4 Adapting option-pricing models for share-based payment transactions 2753
- 8.4.1 Non-transferability 2753
- 8.4.2 Treatment of vesting and non-vesting conditions 2753
  - 8.4.2.A Market-based performance conditions and non-vesting conditions 2754
  - 8.4.2.B Non-market vesting conditions 2754

8.5 Selecting appropriate assumptions for option-pricing models 2754
- 8.5.1 Expected term of the option 2755
  - 8.5.1.A Expected term under the Black-Scholes-Merton formula 2756
- 8.5.2 Exercise and termination behaviour 2757
  - 8.5.2.A Grouping employees with homogeneous exercise behaviour 2758
  - 8.5.2.B Post-vesting termination behaviour 2759
- 8.5.3 Expected volatility of share price 2759
  - 8.5.3.A Newly listed entities 2761
  - 8.5.3.B Unlisted entities 2761
  - 8.5.3.C Listed entities that have undergone significant restructuring 2761
  - 8.5.3.D Expected volatility under the Black-Scholes-Merton formula 2761
  - 8.5.3.E Expected volatility under lattice models 2762
- 8.5.4 Expected dividends 2762
  - 8.5.4.A Expected dividends under the Black-Scholes-Merton formula 2763
  - 8.5.4.B Expected dividends under the binomial model and other lattice models 2763
- 8.5.5 Risk-free interest rate 2763
  - 8.5.5.A Risk-free interest rate under the Black-Scholes-Merton formula 2764
  - 8.5.5.B Risk-free interest rate under binomial and other lattice models 2764

- 8.6 Capital structure effects and dilution 2764
- 8.7 Valuation of equity-settled awards other than options 2765
  - 8.7.1 Shares 2765
  - 8.7.2 Non-recourse loans 2765
  - 8.7.3 Share appreciation rights (SARs) 2766
  - 8.7.4 Performance rights 2766
- 8.8 Awards whose fair value cannot be measured reliably 2766
  - 8.8.1 Intrinsic value method – the basic accounting treatment 2766
  - 8.8.2 Modification, cancellation and settlement 2768
- 8.9 Awards with reload features 2768
- 8.10 Awards of equity instruments to a fixed monetary value 2769

9 CASH-SETTLED TRANSACTIONS 2770

- 9.1 Scope of requirements 2770
- 9.2 What constitutes a cash-settled award? 2770
  - 9.2.1 Formal and informal arrangements for the entity to purchase illiquid shares or otherwise settle in cash (awards to be treated as cash-settled, including unlisted company schemes) 2771
  - 9.2.2 Market purchases of own equity used to satisfy awards 2772
  - 9.2.3 Market purchases of own equity following equity-settlement of award 2772
  - 9.2.4 Arrangements to sell employees' shares including 'broker settlement' 2773
- 9.3 Cash-settled transactions: required accounting 2774
  - 9.3.1 Basic accounting treatment 2774
  - 9.3.2 Application of the accounting treatment 2775
    - 9.3.2.A Determining the vesting period 2777
    - 9.3.2.B Periodic allocation of cost 2777
    - 9.3.2.C Non-market vesting conditions 2777
    - 9.3.2.D Market conditions and non-vesting conditions 2779
    - 9.3.2.E Modification, cancellation and settlement 2779
- 9.4 Modification of award from equity-settled to cash-settled or from cash-settled to equity-settled 2779
  - 9.4.1 Equity-settled award modified to cash-settled award 2780
  - 9.4.2 Cash-settled award modified to equity-settled award 2786

10 TRANSACTIONS WITH EQUITY AND CASH ALTERNATIVES 2788

- 10.1 Transactions where the counterparty has choice of settlement in equity or in cash 2788
  - 10.1.1 Transactions in which the fair value is measured directly 2789
  - 10.1.2 Transactions in which the fair value is measured indirectly – including transactions with employees 2789

- 10.1.3 Accounting treatment 2790
  - 10.1.3.A During vesting period 2790
  - 10.1.3.B Settlement 2792
- 10.1.4 Transactions with cash-settlement alternative for employee introduced after grant date 2792
- 10.1.5 'Backstop' cash settlement rights 2794
- 10.1.6 Convertible bonds issued to acquire goods or services 2794

10.2 Transactions where the entity has choice of settlement in equity or in cash 2795
- 10.2.1 Transactions treated as cash-settled 2795
  - 10.2.1.A Entity choice has no substance due to economic or other compulsion for cash settlement (including unlisted entity awards with a presumption of cash settlement) 2796
- 10.2.2 Transactions treated as equity-settled 2796
- 10.2.3 Change in entity's settlement policy or intention leading to change in classification of award after grant date 2797

10.3 Awards requiring cash or equity settlement in specific circumstances (awards with contingent cash or contingent equity settlement) 2798
- 10.3.1 Approach 1 – Treat as cash-settled if contingency is outside entity's control 2798
- 10.3.2 Approach 2 – Treat as cash-settled if contingency is outside entity's control and probable 2799
- 10.3.3 Application of Approach 1 and Approach 2 to awards requiring cash settlement on a change of control 2800
- 10.3.4 Accounting for change in manner of settlement where award is contingent on future events outside the control of the entity and the counterparty 2801
  - 10.3.4.A Distinction between re-assessment of settlement method and modification of terms of award 2801
- 10.3.5 Manner of settlement contingent on future events: discussions by the IASB and the Interpretations Committee 2802

10.4 Cash settlement alternative where cash sum is not based on share price or value 2803

11 REPLACEMENT SHARE-BASED PAYMENT AWARDS ISSUED IN A BUSINESS COMBINATION 2803

11.1 Background 2803

11.2 Replacement awards in business combinations accounted for under IFRS 3 2804
- 11.2.1 Awards that the acquirer is 'obliged' to replace 2805

11.2.1.A Illustrative examples of awards that the acquirer is 'obliged' to replace 2806
11.2.2 Acquiree awards that the acquirer is not 'obliged' to replace 2808
11.2.3 Accounting for changes in vesting assumptions after the acquisition date 2808
11.3 Acquiree award not replaced by acquirer 2810
11.4 Financial statements of the acquired entity 2811
12 GROUP SHARE SCHEMES 2812
12.1 Typical features of a group share scheme 2812
12.2 Accounting treatment of group share schemes – summary 2814
12.2.1 Background 2814
12.2.2 Scope of IFRS 2 for group share schemes 2814
12.2.3 Entity receiving goods or services 2815
12.2.4 Entity settling the transaction 2816
12.2.5 Transactions settled in equity of the entity or its parent 2816
12.2.5.A Awards settled in equity of subsidiary 2816
12.2.5.B Awards settled in equity of the parent 2817
12.2.6 Cash-settled transactions not settled by the entity receiving goods or services 2817
12.2.7 Intragroup recharges and management charges 2818
12.2.7.A Timing of recognition of intercompany recharges: discussion by the IFRS Interpretations Committee 2820
12.3 Employee benefit trusts ('EBTs') and similar arrangements 2820
12.3.1 Background 2820
12.3.2 Accounting for EBTs 2821
12.3.3 Illustrative Examples – awards satisfied by shares purchased by, or issued to, an EBT 2823
12.3.4 Separate financial statements of sponsoring entity 2825
12.3.5 Financial statements of the EBT 2827
12.4 Illustrative example of group share scheme – equity-settled award satisfied by market purchase of shares 2827
12.4.1 Consolidated financial statements 2827
12.4.2 Parent 2828
12.4.2.A Accounting by parent where subsidiary is the employing entity and EBT is treated as separate entity 2829
12.4.2.B Accounting by parent where subsidiary is the employing entity and EBT is treated as extension of the parent 2829
12.4.2.C Parent company as employing entity 2830

12.4.3 Employing subsidiary 2831

12.5 Illustrative example of group share scheme – equity-settled award satisfied by fresh issue of shares 2832

12.5.1 Consolidated financial statements 2832

12.5.2 Parent 2833

12.5.2.A Accounting by parent where subsidiary is the employing entity and EBT is treated as separate entity 2834

12.5.2.B Accounting by parent where subsidiary is the employing entity and EBT is treated as extension of parent 2834

12.5.2.C Parent as employing entity 2835

12.5.3 Employing subsidiary 2837

12.6 Illustrative example – cash-settled transaction not settled by the entity receiving goods or services 2838

12.6.1 Consolidated financial statements 2838

12.6.2 Parent 2839

12.6.3 Employing subsidiary 2840

12.7 Employee transferring between group entities 2840

12.8 Group reorganisations 2841

12.9 Share-based payments to employees of joint ventures or associates 2842

12.9.1 Financial statements of the associate or joint venture 2842

12.9.2 Consolidated financial statements of the investor 2843

12.9.3 Separate financial statements of the investor 2844

13 DISCLOSURES 2844

13.1 Nature and extent of share-based payment arrangements 2845

13.2 Valuation of share-based payment arrangements 2846

13.3 Impact of share-based payment transactions on financial statements 2848

13.4 Example of IFRS 2 disclosures 2849

14 TAXES RELATED TO SHARE-BASED PAYMENT TRANSACTIONS 2853

14.1 Income tax deductions for the entity 2853

14.2 Employment taxes of the employer 2854

14.2.1 Applicable standard 2854

14.2.1.A IAS 37 2854

14.2.1.B IFRS 2 2854

14.2.1.C IAS 19 2855

14.2.2 Recovery of employer's taxes from employees 2855

14.2.3 Holding of own shares to 'hedge' employment tax liabilities 2857

14.3 Sale or surrender of shares by employee to meet employee's tax liability ('sell to cover' and 'net settlement') 2857

14.3.1 Share-based payments with a net settlement feature for withholding tax obligations (net settlement where IFRS 2 exception applies) 2860

15 OTHER PRACTICAL ISSUES 2862

15.1 Matching share awards (including deferred bonuses delivered in shares) 2862

15.2 Loans to employees to purchase shares (limited recourse and full recourse loans)......2868

15.3 Awards entitled to dividends or dividend equivalents during the vesting period 2870

15.4 Awards vesting or exercisable on an exit event or change of control (flotation, trade sale etc.)......2872

15.4.1 Grant date......2873

15.4.2 Vesting period......2873

15.4.3 Is flotation or sale a vesting condition or a non-vesting condition? 2874

15.4.4 Awards requiring achievement of a minimum price on flotation or sale......2875

15.4.5 Awards 'purchased for fair value' 2876

15.4.6 'Drag along' and 'tag along' rights......2877

15.5 South African black economic empowerment ('BEE') and similar arrangements 2878

15.5.1 Nature of the trust......2879

15.5.2 Measurement and timing of the accounting cost......2880

15.5.3 Classification of awards as equity- or cash-settled 2882

15.6 Shares used as a currency of payment 2882

15.6.1 Awards assessed on the market value of a subsidiary or business unit and settled by reference to the fair value of shares in the parent entity 2883

16 FIRST-TIME ADOPTION AND TRANSITIONAL PROVISIONS 2884

16.1 First-time adoption provisions 2884

List of examples

Example 34.1: Meaning of 'vesting period' – award with vesting conditions only 2671
Example 34.2: Meaning of 'vesting period' – award with vesting and non-vesting conditions 2671
Example 34.3: Determination of grant date 2680
Example 34.4: Awards with multiple service and performance periods 2684
Example 34.5: Award with non-vesting condition only 2693
Example 34.6: Award with service condition only 2694
Example 34.7: Award with no change in the estimate of number of awards vesting 2697
Example 34.8: Award with re-estimation of number of awards vesting due to staff turnover 2697
Example 34.9: Award vesting in instalments ('graded' vesting) 2698
Example 34.10: Award with non-market vesting condition and variable vesting period 2699
Example 34.11: Award with non-market performance vesting condition and variable number of equity instruments 2701
Example 34.12: Award with non-market performance vesting condition and variable exercise price 2703
Example 34.13: Award with market condition 2705
Example 34.14: Award with market condition and fixed vesting period 2707
Example 34.15: Award with market condition and variable vesting period 2708
Example 34.16: Award with market conditions and multiple outcomes 2709
Example 34.17: Award with independent market conditions and non-market vesting conditions 2710
Example 34.18: Does a modification increase or decrease the value of an award? 2716
Example 34.19: Award modified by repricing 2717
Example 34.20: Modification of non-market performance condition in employee's favour 2718
Example 34.21: Increase in number of equity instruments or modification of vesting conditions? 2719
Example 34.22: Award modified by replacing a non-market condition with a market condition 2720
Example 34.23: Award modified by changing non-market performance conditions or service conditions 2721
Example 34.24: Award modified by reducing the exercise price and extending the vesting period 2722
Example 34.25: Modification where number of equity instruments is reduced but total fair value of award is unchanged 2724
Example 34.26: Modification where number of equity instruments is reduced but total fair value of award is increased 2724

Example 34.27: Cancellation and settlement – basic accounting treatment......2728
Example 34.28: Cancellation and settlement – best estimate of cancellation expense 2729
Example 34.29: Replacement awards – is there an accounting arbitrage between accounting for a modification and accounting for cancellation and a new grant? 2731
Example 34.30: Replacement award on termination of employment 2735
Example 34.31: Estimation of number of awards expected to vest – treatment of anticipated future events 2736
Example 34.32: Two option awards running in parallel......2738
Example 34.33: Binomial model......2748
Example 34.34: Intrinsic value method......2767
Example 34.35: Award of shares to a fixed monetary value......2769
Example 34.36: Equity-settled award satisfied with market purchase of treasury shares 2771
Example 34.37: Cash-settled transaction with service condition......2775
Example 34.38: Cash-settled transaction with service condition and non-market performance condition 2778
Example 34.39: Modification of equity-settled award to cash-settled award......2782
Example 34.40: Modification of cash-settled award to equity-settled award......2787
Example 34.41: Award with employee choice of settlement with different fair values for cash-settlement and equity-settlement......2790
Example 34.42: Award with employee cash-settlement alternative introduced after grant......2793
Example 34.43: Settlement of transaction treated as equity-settled where fair value of cash settlement exceeds fair value of equity settlement 2797
Example 34.44: Settlement of transaction treated as equity-settled where fair value of equity settlement exceeds fair value of cash settlement 2797
Example 34.45: Replacement award requiring no post-combination service replacing vested acquiree award......2807
Example 34.46: Replacement award requiring no post-combination service replacing unvested acquiree award 2807
Example 34.47: Replacement award requiring post-combination service replacing vested acquiree award 2807
Example 34.48: Replacement award requiring post-combination service replacing unvested acquiree award......2808
Example 34.49: Accounting for post-acquisition changes in estimates relating to replacement awards......2809
Example 34.50: Interaction of IFRS 10, IAS 32 and IFRS 2 (market purchase) 2823

Example 34.51: Interaction of IFRS 10, IAS 32 and IFRS 2 (fresh issue of shares) 2824
Example 34.52: EBTs in separate financial statements of sponsoring entity..... 2826
Example 34.53: Group share scheme (market purchase of shares).......... 2827
Example 34.54: Group share scheme (fresh issue of shares).......... 2832
Example 34.55: Cash-settled scheme not settled by receiving entity.......... 2838
Example 34.56: Share-based payment to employees of associate 2842
Example 34.57: Recovery of employment tax on share-based payment from employee.......... 2856
Example 34.58: Surrendering of vested shares by employee to indemnify liability of entity to pay employee's tax liability (net settlement where IFRS 2 exception does not apply) 2858
Example 34.59: Share-based payment transactions with a net settlement feature for withholding tax obligations (application of IFRS 2 exception).......... 2861
Example 34.60: Mandatory investment by employee of cash bonus into shares with mandatory matching award by employer 2863
Example 34.61: Mandatory investment by employee of cash bonus into shares with discretionary matching award by employer.......... 2864
Example 34.62: Discretionary investment by employee of cash bonus into shares with no matching award 2865
Example 34.63: Discretionary investment by employee of cash bonus into shares with mandatory matching award by employer 2865
Example 34.64: Discretionary investment by employee of cash bonus into shares with discretionary matching award by employer.......... 2867
Example 34.65: Award with rights to receive (and retain) dividends during vesting period.......... 2871
Example 34.66: Award vesting in instalments with a floatation or sale condition.......... 2874
Example 34.67: Receipt of BEE credentials with no service or performance condition.......... 2881

Chapter 34 Share-based payment

1 INTRODUCTION

1.1 Background

Most share-based payment transactions undertaken by entities are awards of shares and options as remuneration to employees, in particular senior management and directors. In a number of countries, shares and options now comprise the greatest element of the total remuneration package of senior personnel, a trend encouraged by the consensus that it is a matter of good corporate governance to promote significant long-term shareholdings by senior management, so as to align their economic interests with those of shareholders.

One advantage of shares and options as remuneration is that they need not entail any cash cost to the entity. If an executive is entitled under a bonus scheme to a free share, the entity can satisfy this award simply by printing another share certificate, which the executive can sell, so that the cash cost of the award is effectively borne by shareholders rather than by the entity itself. However, this very advantage was the source of the controversy surrounding share-based remuneration.

Investors became increasingly concerned that share-based remuneration was resulting in a significant cost to them, through dilution of their existing shareholdings. As a result, there emerged an increasing consensus among investors that awards of shares and share options should be recognised as a cost in the financial statements.

The opposing view, held by most entities, was that the financial statements were simply reflecting the economic reality that such awards are ultimately a cost to other shareholders and not to the entity. Another powerful argument for those opposed to expensing options was to point out that some clearly successful companies, particularly in the new technology sector, would never have shown a profit if they had been required to book an accounting expense for options.

1.2 Development of IFRS 2 and amendments to the standard

In November 2002, the IASB issued an exposure draft ED 2 – *Share-based Payment* – proposing that share-based payments for goods and services should be expensed. The exposure draft proved highly controversial. Those who supported it in principle nevertheless had concerns on nearly every detail of the accounting treatment proposed, in particular the fact that it did not permit any 'truing up', i.e. reversing any expense previously charged for an award that never actually crystallises. More fundamentally, many questioned whether there yet existed a methodology sufficiently robust for valuing shares and share options subject to the restrictions and performance conditions typically associated with employee share awards. There also remained a significant minority who still questioned the whole principle of expensing options and other share awards.

Despite these comments, the IASB finalised its proposals with the publication of IFRS 2 – *Share-based Payment* – on 19 February 2004, although some significant changes had been necessary to the prohibition on 'truing up' in the ED. In particular, IFRS 2 requires an expense to be recognised only for awards that vest (or are considered by IFRS 2 to vest), but (in the case of awards settled in shares) based on their fair value at the date of grant. Nevertheless, IFRS 2 remains contentious: for example, there is still only limited provision for 'truing up', with the result that significant costs can potentially be recognised for awards that ultimately have no value to their recipients, and give rise to no dilution of the interests of other shareholders. Some commentators continue to question whether existing option valuation models can produce a reliable valuation of employee share awards.

The IASB has issued the following amendments to the original version of IFRS 2:

- *Vesting Conditions and Cancellations*,[1] issued in January 2008 ('the January 2008 amendment'). Entities are required to apply IFRS 2 as modified by this amendment for periods beginning on or after 1 January 2009; *[IFRS 2.62]*
- *Group Cash-settled Share-based Payment Transactions*,[2] issued in June 2009 ('the June 2009 amendment'). Entities are required to apply IFRS 2 as modified by this amendment for periods beginning on or after 1 January 2010; *[IFRS 2.63]*
- *Improvements to IFRSs,* issued in April 2009 ('the April 2009 amendment'). This made a minor amendment to the scope of IFRS 2;
- *Annual Improvements to IFRSs 2010-2012 Cycle*, issued in December 2013, which made amendments to the definitions in Appendix A of IFRS 2 relating to vesting conditions; and
- *Classification and Measurement of Share-based Payment Transactions,*[3] issued in June 2016 ('the June 2016 amendments'). Entities are required to apply these amendments for accounting periods beginning on or after 1 January 2018. *[IFRS 2.63D]*.

There have also been two interpretations of IFRS 2 by the IFRS Interpretations Committee, IFRIC 8 – *Scope of IFRS 2* – and IFRIC 11 – *IFRS 2 – Group and Treasury Share Transactions*, but these were incorporated into IFRS 2 as part of the June 2009 amendment and the separate interpretations withdrawn. *[IFRS 2.64]*.

Revision of, and amendments to, IFRS 3 – *Business Combinations* – in 2008 and 2010 respectively, led to consequential amendments to IFRS 2. The revised and amended IFRS 3 provides guidance on the replacement of share-based payment awards in a business combination (see 11 below).

The revision of the *Conceptual Framework* in 2018 led to a minor consequential amendment to IFRS 2 as part of the *Amendments to References to the Conceptual Framework in IFRS Standards*.[4] The revision amended the footnote to the definition of an equity instrument in Appendix A (see 1.4.1 below).

IFRS 2 is supplemented by implementation guidance.

1.2.1 IFRS 2 research project

In May 2015, the IASB announced a research project into certain aspects of IFRS 2.[5]

The objectives of the project were:

- to identify whether it is IFRS 2 that is causing perceived complexity in accounting for share-based payment arrangements and, if it is, to identify the most common areas of complexity; and
- to analyse why IFRS 2 has attracted so many interpretation requests.

In November 2015 the IASB considered a staff report which included an analysis of application issues and their causes, an analysis of the two measurement models in IFRS 2 (equity-settled and cash-settled) and various approaches for moving the project forward.[6] The staff report observed that, on the basis of research and outreach performed, the complexity of applying IFRS 2 in practice has two main causes: the complexity of share-based payment arrangements themselves and use of the grant date fair value measurement model.[7]

Following an update on feedback received by its staff since November 2015, the IASB decided in May 2016:

- not to perform any further research on this topic;
- that there is no need to seek feedback on that decision or on the staff's findings; and
- that there is no need to publish a formal research paper or discussion paper summarising the research performed as part of this project but the staff will consider how best to make the work performed visible and retrievable.[8]

The IASB published a summary of the research findings in October 2018, confirming the main sources of complexity in accounting for share-based payments, are as noted above: the variety and complexity of the terms and conditions of share-based payments and use of grant date fair value measurement. The project summary also comments on criticism of excessive disclosures in the standard.[9]

The IASB confirmed in the Project Summary, that the terms and conditions of share-based payments are varied and complex and that this variety and complexity contribute significantly to complexity in accounting for transactions involving share-based payments. Subsequently, accounting standards cannot remove the complexity arising from the variety and complexity of terms and conditions of share-based payments.

In considering the complexity of the grant date fair value measurement model used for equity-settled share-based payments, the IASB confirmed in the Project Summary the application issues covered three areas:

- Difficulty in understanding why changes in share price do not affect the accounting for equity-settled share-based payments: the research found that the treatment is consistent with the accounting for other obligations that must be settled by issuing equity instruments in payment; and reflects the fact that the value of services received is unlikely to change after the grant date.
- Complexity in classifying conditions of share-based payments as vesting or non-vesting: the research found that reducing that complexity significantly would require fundamental changes that would negate the advantages of the grant-date fair value measurement model and could be inconsistent with the distinction made between liabilities and equity in accounting for other obligations that must be settled by issuing equity instruments in payment.
- The apparently counterintuitive results for some actions that change equity-settled share-based payments, for example continuing to recognise expense for cancelled share-based payments and not reversing expense for 'negative' modifications of share-based payments: the staff research confirmed that the Basis for Conclusions on IFRS 2 provides for the approach to these items.

In addressing the criticisms that IFRS 2 leads entities to disclose excessive information in their financial statements, the research findings reminded preparers that IAS 1 – *Presentation of Financial Statements* – provides appropriate flexibility in how entities can disclose information about share-based payments. Therefore, entities should exercise judgement in deciding which information is material and must be disclosed.

1.3 Scope of the chapter and referencing convention

This chapter generally discusses the requirements of IFRS 2 for accounting periods beginning on or after 1 January 2021 and reflects those amendments to the original version of IFRS 2, referred to at 1.2 above, that are effective (without early adoption) as at that date. This amended version of IFRS 2 is referred to as 'IFRS 2' throughout the chapter. A detailed discussion of the application of earlier versions of the standard can be found in *International GAAP 2020* and earlier editions.

1.4 Overall approach of IFRS 2

IFRS 2 is a complex standard, in part because its overall accounting approach is something of a hybrid. Essentially the total cost (i.e. measurement) of an award is calculated by determining whether the award is a liability or an equity instrument, using criteria somewhat different from those in IAS 32 – *Financial Instruments: Presentation* (see 1.4.1 below), but then applying the measurement principles generally applicable to liabilities or equity instruments under IAS 32 and IFRS 9 – *Financial Instruments*. However, the periodic allocation (i.e. recognition) of the cost is determined using something closer to a straight-line accrual methodology, which would not generally be used for financial instruments. For convenience, throughout this chapter we refer to the recognition of a cost for share-based payments. In some cases, however, a share-based payment transaction may initially give rise to an asset (e.g. where employee costs are capitalised as part of the cost of PP&E or inventories).

This inevitably has the result that, depending on its legal form, a transaction of equal value to the recipient can result in several different potential charges in profit or loss for the entity, causing some to call into question the comparability of the information provided. Moreover, IFRS 2 is in many respects a rules-based 'anti-avoidance' standard, which often requires an expense to be recorded for transactions that either have no ultimate value to the counterparty or to which, in some cases, the counterparty actually has no entitlement at all.

IFRS 2 has an unusually long Basis for Conclusions – longer in fact than the standard and implementation guidance combined, highlighting some of the controversy in the development of the standard.

1.4.1 Classification differences between IFRS 2 and IAS 32/IFRS 9

As noted above, not only are there differences between the accounting treatment of liabilities or equity under IFRS 2 as compared with that under IAS 32 and IFRS 9, but the classification of a transaction as a liability or equity transaction under IFRS 2 may differ from that under IAS 32.

One of the most important differences between IAS 32 and IFRS 2 is that a transaction involving the delivery of equity instruments within the scope of IFRS 2 is always accounted for as an equity transaction, whereas a similar transaction within the scope of IAS 32 might well be classified as a liability if the number of shares to be delivered varies.

The IASB offers some (pragmatic rather than conceptual) explanation for these differences in the Basis for Conclusions to IFRS 2. First, it is argued that to apply IAS 32 to share option plans would mean that a variable share option plan (i.e. one where the number of shares varied according to performance) would give rise to a more volatile (and typically greater) cost than a fixed plan (i.e. one where the number of shares to be awarded is fixed from the start), even if the same number of shares was ultimately delivered under each plan, which would have 'undesirable consequences'. *[IFRS 2.BC109]*. Second, it is argued that this is just one of several inconsistencies between IAS 32 and IFRS 2 to be addressed as part of the IASB's review of the definitions of liabilities and equity in the *Conceptual Framework*. *[IFRS 2.BC110]*.

The revision of the *Conceptual Framework* in 2018 led to a minor consequential amendment to the footnote to the definition of an equity instrument in Appendix A to IFRS 2. It is the definition of a liability within the footnote that has been revised rather than the definition of an equity instrument (see 1.2 above). In paragraph BC384 of the Basis for Conclusions to IFRS 2, the Board notes that the 2018 *Conceptual Framework* did not address classification of financial instruments with characteristics of both liabilities and equity and that the consequential amendments did not amend the guidance on classification of financial instruments in IFRS 2. Therefore, it does not expect the amendment to the footnote in IFRS 2 to have a significant effect on the application of the standard.

The boundary between liabilities and equity will be further explored by the IASB in its research project on *Financial Instruments with Characteristics of Equity*.[10] Until there are any further amendments resulting from this or other projects, there will continue to be differences between the accounting and classification treatment of liabilities and equity under IFRS 2, compared with that under IAS 32 and IFRS 9.

2 THE OBJECTIVE AND SCOPE OF IFRS 2

This section sets out the objective of IFRS 2 (see 2.1 below) and then considers the scope of the standard in the following sub-sections:

- definitions in IFRS 2 relevant to the scope of the standard (see 2.2.1 below);
- transactions and arrangements within the scope of IFRS 2 (see 2.2.2 below) including arrangements within a group and with shareholders (see 2.2.2.A below);
- transactions outside the scope of IFRS 2 (see 2.2.3 below); and
- application of the scope requirements to a number of situations frequently encountered in practice (see 2.2.4 below).

Further details of the transactions and arrangements discussed are given at the start of each sub-section.

2.1 Objective

The objective of IFRS 2 is 'to specify the financial reporting by an entity when it undertakes a share-based payment transaction. In particular, it requires an entity to reflect in its profit or loss and financial position the effects of share-based payment transactions, including expenses associated with transactions in which share options are granted to employees'. *[IFRS 2.1]*.

2.2 Scope

2.2.1 Definitions

The following definitions are relevant to the scope of IFRS 2. *[IFRS 2 Appendix A]*.

A *share-based payment arrangement* is 'an agreement between the entity (or another group entity or any shareholder of any group entity) and another party (including an employee) that entitles the other party to receive

(a) cash or other assets of the entity for amounts that are based on the price (or value) of equity instruments (including shares or share options) of the entity or another group entity, or

(b) equity instruments (including shares or share options) of the entity or another group entity,

provided the specified vesting conditions, if any, are met.'

A *share-based payment transaction* is 'a transaction in which the entity

(a) receives goods or services from the supplier of those goods or services (including an employee) in a share-based payment arrangement, or

(b) incurs an obligation to settle the transaction with the supplier in a share-based payment arrangement when another group entity receives those goods or services.'

An *equity-settled share-based payment transaction* is 'a share-based payment transaction in which the entity

(a) receives goods or services as consideration for its own equity instruments (including shares or share options), or

(b) receives goods or services but has no obligation to settle the transaction with the supplier.'

A *cash-settled share-based payment transaction* is 'a share-based payment transaction in which the entity acquires goods or services by incurring a liability to transfer cash or other assets to the supplier of those goods or services for amounts that are based on the price (or value) of equity instruments (including shares or share options) of the entity or another group entity'.

A *group entity* in the four definitions above means any parent, subsidiary, or subsidiary of any parent, of the entity and is based on the definition of 'group' in Appendix A to IFRS 10 – *Consolidated Financial Statements* – as 'a parent and its subsidiaries'. *[IFRS 2.63A, BC22E]*.

An *equity instrument* is 'a contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities'.

An *equity instrument granted* is 'the right (conditional or unconditional) to an equity instrument of the entity conferred by the entity on another party, under a share-based payment arrangement'.

A *share option* is 'a contract that gives the holder the right, but not the obligation, to subscribe to the entity's shares at a fixed or determinable price for a specified period of time'.

It will be seen from these definitions that IFRS 2 applies not only to awards of shares and share options but also to awards of cash (or other assets) of a value equivalent to the value, or a movement in the value, of a particular number of shares. Such cash awards may arise in a number of situations. For example:

- an entity may wish to extend its share scheme to the employees of overseas subsidiaries in jurisdictions where it may be difficult, or even illegal, to trade in the entity's shares, or where delivering shares would not give the same tax benefits to employees as would apply in the parent's own jurisdiction; or
- the entity may not wish to dilute existing shareholdings by significant share awards to employees.

In such cases, the employees may instead be offered cash equivalent to the value of the shares that they would otherwise have obtained.

2.2.2 Transactions within the scope of IFRS 2

Subject to the exceptions noted at 2.2.3 below, IFRS 2 must be applied to all share-based payment transactions, including:

(a) equity-settled share-based payment transactions (discussed at 4 to 8 below);

(b) cash-settled share-based payment transactions (discussed at 9 below); and

(c) transactions where either the entity or the supplier of goods or services can choose whether the transaction is to be equity-settled or cash-settled (discussed at 10 below). *[IFRS 2.2]*.

Whilst the boundaries between these types of transaction are reasonably self-explanatory, there may be transactions – as discussed in more detail at 9 and 10 below – that an entity may intuitively regard as equity-settled which are in fact required to be treated as cash-settled under IFRS 2.

Although IFRS 2 was primarily a response to concerns over share-based remuneration, its scope is not restricted to transactions with employees. For example, if an external supplier of goods or services, including another group entity, is paid in shares or share options, or cash (or other assets) of equivalent value, IFRS 2 must be applied. Goods include:

- inventories;
- consumables;
- property, plant and equipment;
- intangibles; and
- other non-financial assets. *[IFRS 2.5]*.

It will be seen that 'goods' do not include financial assets, which raises some further issues (see 2.2.3.F below).

The scope of IFRS 2 extends to:

- group share schemes and certain transactions with shareholders (see 2.2.2.A below);
- transactions with employee benefit trusts and similar vehicles (see 2.2.2.B below);
- transactions where the identifiable consideration received appears to be less than the consideration given (see 2.2.2.C below);
- 'all employee' share plans (see 2.2.2.D below); and
- vested transactions (see 2.2.2.E below).

2.2.2.A Group schemes and transactions with group shareholders: scope issues

The definitions of 'share-based payment arrangement' and 'share-based payment transaction' at 2.2.1 above have the effect that the scope of IFRS 2 is not restricted to transactions where the reporting entity acquires goods or services in exchange for its own equity instruments (or cash or other assets based on the cost or value of those equity instruments). Within a group of companies it is common for one member of the group (typically the parent) to have the obligation to settle a share-based payment transaction in which services are provided to another member of the group (typically a subsidiary). This transaction is within the scope of IFRS 2 for the entity receiving the services (even though it is not a direct party to the arrangement between its parent and its employee), the entity settling the transaction and the group as a whole.

Accordingly, IFRS 2 requires an entity to account for a transaction in which it either:

- receives goods or services when another entity in the same group (or a shareholder of any group entity) has the obligation to settle the share-based payment transaction, or
- has an obligation to settle a share-based payment transaction when another entity in the same group receives the goods or services

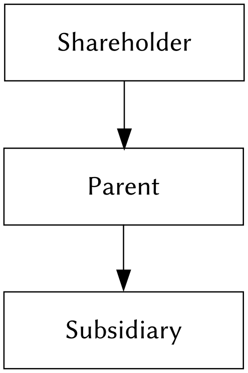
unless the transaction is clearly for a purpose other than payment for goods or services supplied to the entity receiving them. *[IFRS 2.3A]*.

Moreover, the definitions of 'equity-settled share-based payment transaction' and 'cash-settled share-based payment transaction' have the effect that the analysis of the transaction as equity-settled or cash-settled (and its accounting treatment) may differ when viewed from the perspective of the entity receiving the goods or services, the entity settling the transaction and the group as a whole. *[IFRS 2.43A]*.

We consider below seven scenarios, based on the simple structure in Figure 34.1 below. These scenarios are by no means exhaustive, but cover the situations most commonly seen in practice.

The scenarios considered in this section do not consider recharge arrangements between group entities. The accounting treatment of group share schemes, including those with recharge arrangements, is discussed in more detail at 12 below.

Figure 34.1: Scope of IFRS 2



The scenarios assume that:

- the shareholder is not a group entity; and
- the subsidiary is directly owned by the parent company (see 12.2.1 below in relation to intermediate parent companies).

Scenario	**Who grants the award?**	**Which entity receives the goods or services?**	**Who settles the award?**	**On which entity's shares is the award based?**	**Award settled in shares or cash?**
1	Parent	Subsidiary	Parent	Parent	Shares
2	Shareholder	Subsidiary	Shareholder	Parent	Shares
3	Subsidiary	Subsidiary	Subsidiary	Parent	Shares
4	Subsidiary	Subsidiary	Subsidiary	Subsidiary	Shares
5	Parent	Subsidiary	Parent	Subsidiary	Shares
6	Parent	Subsidiary	Parent	Parent	Cash
7	Shareholder	Subsidiary	Shareholder	Parent	Cash

Scenario 1

Parent awards equity shares in Parent to employees of Subsidiary in exchange for services to Subsidiary. Parent settles the award with the employees of Subsidiary. *[IFRS 2.43B-43C, B52(a), B53-B54].*

Consolidated financial statements of Parent

Under the definition of 'share-based payment transaction', 'the entity [i.e. the Parent group] ... receives goods or services ... in a share-based payment arrangement ...'. A share-based payment arrangement includes 'an agreement between the entity ... and another party (including an employee) that entitles the other party to receive ... equity instruments ... of the entity ...'.

The transaction is classified as an equity-settled transaction because it is settled in an equity instrument of the group.

Separate financial statements of Parent

Under the definition of 'share-based payment transaction', 'the entity [i.e. the Parent as a single entity] ... incurs an obligation to settle the transaction with the supplier in a share-based payment arrangement when another group entity receives those goods or services'.

The transaction is classified as an equity-settled transaction because it is settled in an equity instrument of Parent.

Subsidiary

Under the definition of 'share-based payment transaction', 'the entity [i.e. Subsidiary] ... receives goods or services ... in a share-based payment arrangement ...'. A 'share-based payment arrangement' includes 'an agreement between ... another group entity [i.e. Parent] ... and another party (including an employee) that entitles the other party to receive ... equity instruments of ... another group entity'.

The transaction is classified as an equity-settled transaction because Subsidiary 'has no obligation to settle the transaction with the supplier'.

Even if Subsidiary is not a party to the agreement with its employees, it nevertheless records a cost for this transaction. In effect, the accounting treatment is representing that Subsidiary has received a capital contribution from Parent, which Subsidiary has then 'spent' on employee remuneration. This treatment is often referred to as 'push-down' accounting – the idea being that a transaction undertaken by one group entity (in this case, Parent) for the benefit of another group entity (in this case, Subsidiary) is 'pushed down' into the financial statements of the beneficiary entity.

Scenario 2

Shareholder awards equity shares in Parent to employees of Subsidiary in exchange for services to Subsidiary. Shareholder settles the award with the employees of Subsidiary. *[IFRS 2.B48(b)]*.

Consolidated financial statements of Parent

Under the definition of 'share-based payment transaction', 'the entity [i.e. the Parent group] ... receives goods or services ... in a share-based payment arrangement'. A 'share-based payment arrangement' includes 'an agreement between ... any shareholder ... and another party (including an employee) that entitles the other party to receive ... equity instruments (including shares or share options) of the entity...'.

The transaction is classified as an equity-settled transaction, because the Parent group 'has no obligation to settle the transaction with the supplier'.

Separate financial statements of Parent

Scenario 2 is not within the scope of IFRS 2 for the separate financial statements of Parent, because Parent (as a separate entity) receives no goods or services, nor does it settle the transaction.

Subsidiary

Under the definition of 'share-based payment transaction', 'the entity [i.e. Subsidiary] ... receives goods or services ... in a share-based payment arrangement'. A 'share-based payment arrangement' includes 'an agreement between ... any shareholder of any group entity [i.e. Shareholder] ... and another party (including an employee) that entitles the other party to receive equity instruments of ... another group entity [i.e. Parent]'.

The transaction is classified as an equity-settled transaction, because Subsidiary 'has no obligation to settle the transaction with the supplier'.

IFRS 2 does not explicity address the accounting treatment for such a transaction within the financial statements of a shareholder that is not a group entity. *[IFRS 2.BC22G]*. We discuss at 12.9 below the accounting treatment of such transactions in the financial statements of a shareholder that is an investor in a joint venture or associate.

Scenario 3

Subsidiary awards equity shares in Parent to employees of Subsidiary in exchange for services to Subsidiary. Subsidiary settles the award with the employees of Subsidiary. *[IFRS 2.43B, B52(b), B55]*.

Consolidated financial statements of Parent

Under the definition of 'share-based payment transaction', 'the entity [i.e. the Parent group] ... receives goods or services ... in a share-based payment arrangement'. A 'share-based payment arrangement' includes 'an agreement between the entity ... and another party (including an employee) that entitles the other party to receive ... equity instruments (including shares or share options) of the entity'.

The transaction is classified as an equity-settled transaction, because the Parent group 'receives goods or services as consideration for its own equity instruments (including shares or share options) ...'.

Separate financial statements of Parent

Scenario 3 is not within the scope of IFRS 2 for the separate financial statements of Parent, because Parent (as a separate entity) receives no goods or services, nor does it settle the transaction.

Subsidiary

Under the definition of 'share-based payment transaction', 'the entity [i.e. Subsidiary] ... receives goods or services ... in a share-based payment arrangement'. A 'share-based payment arrangement' includes 'an agreement between ... [a] group entity [i.e. Subsidiary] ... and another party (including an employee) that entitles the other party to receive equity instruments of ... another group entity [i.e. Parent]'.

The transaction is classified as a cash-settled transaction because Subsidiary has the obligation to settle the award with equity instruments issued by Parent – i.e. a financial asset in Subsidiary's separate financial statements – rather than with Subsidiary's own equity instruments.

However, for the approach in this Scenario to apply, it must be the case that Subsidiary grants the award as a principal rather than as agent for Parent and Subsidiary has the obligation to settle. If Subsidiary appears to be granting an award but is really doing so only on the instructions of Parent, as will generally be the case in certain jurisdictions, then the approach in Scenario 1 above is more likely to apply. This is discussed in more detail at 12.2.5.B below.

Scenario 4

Subsidiary awards equity shares in Subsidiary to employees of Subsidiary in exchange for services to Subsidiary. Subsidiary settles the award with the employees of Subsidiary. *[IFRS 2.43B, B49]*.

Consolidated financial statements of Parent

Under the definition of 'share-based payment transaction', 'the entity [i.e. the Parent group] ... receives goods or services ... in a share-based payment arrangement'. A share-based payment arrangement includes 'an agreement between the entity ... and another party (including an employee) that entitles the other party to receive ... equity instruments ... of the entity ...'.

The transaction is classified as an equity-settled transaction, because it is settled in an equity instrument of the group. In the consolidated financial statements of Parent, shares of Subsidiary not held by Parent are a non-controlling interest, classified as equity (see Chapter 7 at 4).

Separate financial statements of Parent

Scenario 4 is not within the scope of IFRS 2 for the separate financial statements of Parent, because Parent (as a separate entity) receives no goods or services, nor does it settle the transaction.

Subsidiary

Under the definition of 'share-based payment transaction', 'the entity [i.e. Subsidiary] ... receives goods or services ... in a share-based payment arrangement'.

The transaction is classified as an equity-settled transaction, because it is settled in an equity instrument of Subsidiary.

Scenario 5

Parent awards equity shares in Subsidiary to employees of Subsidiary in exchange for services to Subsidiary. Parent settles the award with the employees of Subsidiary. *[IFRS 2.43B-43C, B50]*.

Consolidated financial statements of Parent

Under the definition of 'share-based payment transaction', 'the entity [i.e. the Parent group] ... receives goods or services ... in a share-based payment arrangement'. A share-based payment arrangement includes 'an agreement between the entity ... and another party (including an employee) that entitles the other party to receive ... equity instruments of the entity ...'.

The transaction is classified as an equity-settled transaction, because it is settled in an equity instrument of the group. In the consolidated financial statements of Parent, shares of Subsidiary not held by Parent are a non-controlling interest, classified as equity (see Chapter 7 at 4).

Separate financial statements of Parent

Under the definition of 'share-based payment transaction', 'the entity [i.e. the Parent as a single entity] ... incurs an obligation to settle the transaction with the supplier in a share-based payment arrangement when another group entity [i.e. Subsidiary] receives those goods or services'. The transaction is a share-based payment arrangement for Subsidiary (see below) and the consolidated financial statements of Parent (see above).

For Parent, the transaction is classified as a cash-settled transaction, because it is settled not in an equity instrument issued by Parent, but in an equity instrument issued by a subsidiary and held by Parent – i.e. a financial asset in Parent's separate financial statements.

Subsidiary

Under the definition of 'share-based payment transaction', 'the entity [i.e. Subsidiary] ... receives goods or services ... in a share-based payment arrangement'. A 'share-based payment arrangement' includes 'an agreement between ... another group entity [i.e. Parent] ... and another party (including an employee) that entitles the other party to receive equity instruments of the entity...'.

The transaction is classified as an equity-settled transaction, because Subsidiary 'has no obligation to settle the transaction with the supplier'.

Scenario 6

Parent awards cash based on the value of shares in Parent to employees of Subsidiary in exchange for services to Subsidiary. Parent settles the award with the employees of Subsidiary. *[IFRS 2.43C, B56-B58]*.

Consolidated financial statements of Parent

Under the definition of 'share-based payment transaction', 'the entity [i.e. the Parent group] ... receives goods or services ... in a share-based payment arrangement'. A 'share-based payment arrangement' includes 'an agreement between the entity ... and another party (including an employee) that entitles the other party to receive ... cash ... of the entity ... based on the price (or value) of equity instruments ... of the entity ...'.

The transaction is classified as a cash-settled transaction, because it is settled in cash of the group.

Separate financial statements of Parent

Under the definition of 'share-based payment transaction', 'the entity [i.e. the Parent as a single entity] ... incurs an obligation to settle the transaction with the supplier in a share-based payment arrangement when another group entity [i.e. Subsidiary] receives those goods or services'.

The transaction is classified as a cash-settled transaction, because it is settled in cash of Parent.

Subsidiary

IFRS 2 contains detailed guidance for the accounting treatment of such transactions by the employing subsidiary (see 12 below), from which it may reasonably be inferred that the IASB intended them to be in the scope of IFRS 2 for the subsidiary.

However, this is strictly not the case when the drafting of IFRS 2 is examined closely. In order to be a share-based payment transaction (and therefore in the scope of IFRS 2) for the reporting entity, a transaction must also be a share-based payment arrangement. A share-based payment arrangement is defined as one in which the counterparty receives (our emphasis added):

- equity of the entity or any other group entity, or
- cash or other assets of the entity.

As drafted, the definition has the effect that a transaction settled in equity is in the scope of IFRS 2 for a reporting entity, whether the equity used to settle is the entity's own equity or that of another group entity. Where a transaction is settled in cash, however, the definition has the effect that a transaction is in the scope of IFRS 2 for a reporting entity only when that entity's own cash (or other assets) is used in settlement, and not when another group entity settles the transaction.

However, given the guidance referred to above in IFRS 2 for the accounting treatment for the reporting entity of transactions settled in cash by another group entity, we believe that the exclusion of such transactions from the definition of 'share-based payment arrangement' should be disregarded as a drafting slip.

The transaction is classified as an equity-settled transaction by Subsidiary, because Subsidiary 'has no obligation to settle the transaction with the supplier'.

Scenario 7

Shareholder awards cash based on the value of shares in Parent to employees of Subsidiary in exchange for services to Subsidiary. Shareholder settles the award with the employees of Subsidiary.

For the reasons set out in Scenario 6 above, this transaction is not strictly in the scope of IFRS 2 as drafted either for the consolidated or separate financial statements of Parent or for the individual financial statements of Subsidiary. As noted in Scenario 6 above, the definition of 'share-based payment arrangement' as drafted excludes any arrangement that is settled in cash by a party other than the reporting entity. Moreover, whilst IFRS 2 gives detailed guidance that effectively appears to 'over-ride' the definition in respect of a transaction settled by another group entity (see Scenario 6 above), there is no such over-riding guidance in respect of a transaction settled in cash by a non-group shareholder. The transaction is not within the scope of IFRS 2 for the separate financial statements of Parent, because Parent (as a separate entity) receives no goods or services, nor does it settle the transaction.

Nevertheless, we believe that the transaction should be treated as within the scope of IFRS 2 for the consolidated financial statements of Parent and the individual financial statements of Subsidiary. One of the original objectives of the project that led to the issue of the June 2009 amendment to IFRS 2 was to address a concern that, as originally issued, IFRS 2 did not require an entity to account for a cash-settled share-based payment transaction settled by an external shareholder.

In addition to the accounting treatment under IFRS 2, the group entities in this Scenario would need to consider the requirements of IAS 24 – *Related Party Disclosures* – as any payments by a shareholder would potentially need to be disclosed (see Chapter 39).

2.2.2.B Transactions with employee benefit trusts and similar vehicles

In some jurisdictions, it is common for an entity to establish a trust to hold shares in the entity for the purpose of satisfying, or 'hedging' the cost of, share-based awards to employees. In such cases, it is often the trust, rather than any entity within the legal group, that actually makes share-based awards to employees.

A sponsoring employer (or its wider group) will need to assess whether it controls the trust in accordance with the requirements of IFRS 10 and therefore whether the trust should be consolidated (see 12.3 below and Chapter 6).

Awards by employee benefit trusts and similar vehicles are within the scope of IFRS 2, irrespective of whether or not the trust is consolidated, since:

- where the trust is consolidated, it is an award by a group entity; and
- where the trust is not consolidated, it is an award by a shareholder.

2.2.2.C Transactions where the identifiable consideration received appears to be less than the consideration given

A share-based payment transaction as defined (see 2.2.1 above) involves the receipt of goods or services by the reporting entity or by another group entity. Nevertheless, IFRS 2 also applies to share-based payment transactions where no specifically identifiable goods or services have been (or will be) received. *[IFRS 2.2].*

IFRS 2 asserts that, if the identifiable consideration received (if any) appears to be less than the fair value of consideration given, the implication is that, in addition to the identifiable goods and services acquired, the entity must also have received some unidentifiable consideration equal to the difference between the fair value of the share-based payment and the fair value of any identifiable consideration received. Accordingly, the cost of the unidentified consideration must be accounted for in accordance with IFRS 2. *[IFRS 2.13A].*

For example, if an entity agrees to pay a supplier of services with a clearly identifiable market value of £1,000 by issuing shares with a value of £1,500, IFRS 2 requires the entity to recognise an expense of £1,500. This is notwithstanding the normal requirement of IFRS 2 that an equity-settled share-based payment transaction with a non-employee be recognised at the fair value of the goods or services received (see 5.1 and 5.4 below).

This requirement was introduced by IFRIC 8 (since incorporated into IFRS 2). The reason for the change is alluded to in an illustrative example. *[IFRS 2.IG5D, IG Example 1].* As part of general economic reforms in South Africa, under arrangements generally referred to as black economic empowerment or 'BEE' (discussed further at 15.5 below), various entities issued or transferred significant numbers of shares to bodies representing historically disadvantaged communities. Some took the view that these transactions did not fall within the scope of IFRS 2 as originally drafted because the entities concerned were not purchasing goods or services. Rather, BEE arrangements were simply meant to replicate a transfer of shares from one group of shareholders to another. Accordingly, it was argued, such transactions did not fall within the scope of IFRS 2, since it is intrinsic to the definition of a 'share-based payment transaction' (see 2.2.1 above) that goods or services are received.

IFRS 2 rejects this argument. It effectively takes the view that, since the directors of an entity would not issue valuable consideration for nothing, something must have been received. *[IFRS 2.BC18C].* IFRS 2 suggests that a transfer of equity under BEE and similar schemes is made 'as a means of enhancing [the entity's] image as a good corporate citizen'. *[IFRS 2 IG Example 1].*

There seems little doubt that this aspect of IFRS 2 is in part an 'anti-avoidance' measure. As discussed in 4 to 8 below, the general measurement rule in IFRS 2 is that share-based payment transactions with employees are measured by reference to the fair value of the consideration given and those with non-employees by reference to the fair value of the consideration received. We argue at 5.2.2 below that the requirement to measure transactions with employees by reference to the consideration given is essentially an anti-avoidance provision. It prevents entities from recognising a low cost for employee share options on the grounds that little incremental service is provided for them beyond that already provided for cash-based remuneration. The changes introduced by IFRIC 8 removed the potential for a similar abuse in accounting for transactions with non-employees.

Nevertheless, the IASB acknowledges that there may be rare circumstances in which a transaction may occur in which no goods or services are received by the entity. For example, a principal shareholder of an entity, for reasons of estate planning, may transfer shares to a relative. In the absence of indications that the relative has provided, or is expected to provide, goods or services to the entity in exchange for the shares, such a transfer would be outside the scope of IFRS 2. *[IFRS 2.BC18D].*

See also the discussions at 2.2.3.A below relating to transactions with shareholders in their capacity as such and at 2.2.4.K below relating to dual pricing on a share issue.

2.2.2.D 'All employee' share plans

Many countries encourage wider share-ownership by allowing companies to award a limited number of free or discounted shares to employees without either the employee or the employer incurring tax liabilities which would apply if other benefits in kind to an equivalent value were given to employees.

Some national accounting standards exempt some such plans from their scope, to some extent as the result of local political pressures. Prior to issuing IFRS 2, the IASB received some strong representations that IFRS should give a similar exemption, on the grounds that not to do so would discourage companies from continuing with such schemes.

The IASB concluded that such an exemption would be wrong in principle and difficult to draft in practice. By way of concession, the Basis for Conclusions hints that if the IFRS 2 charge for such schemes is (as asserted by some of the proponents of an exemption) *de minimis*, then there would be no charge under IFRS 2 anyway, since, like all IFRSs, it applies only to material items. *[IFRS 2.BC8-17]*. However, our experience is that, in many cases, the charge is material.

2.2.2.E Vested transactions

Once a transaction accounted for under IFRS 2 has vested in the counterparty (see 3 below), it does not necessarily cease to be in the scope of IFRS 2 just because the entity has received the goods or services required for the award to vest. This is made clear by the numerous provisions of IFRS 2 referring to the accounting treatment of vested awards.

Once equity shares have been unconditionally delivered or beneficially transferred to the counterparty (e.g. as the result of the vesting of an award of ordinary shares, or the exercise of a vested option over ordinary shares), the holder of those shares will often be in exactly the same position as any other holder of ordinary shares and the shares will generally be accounted for under IAS 32 and IFRS 9 rather than IFRS 2.

If, however, the holder of a share or vested option enjoys rights not applicable to all holders of that class of share, such as a right to put the share or the option to the entity for cash, or holds a special class of share with rights that do not apply to other classes of equity, the share or option might still remain in the scope of IFRS 2 as long as any such rights continue to apply. The same is true of modifications made after vesting which add such rights to a vested share or option or otherwise alter the life of the share-based payment transaction. The special terms or rights will often be linked to the holder's employment with the entity but could also apply to an arrangement with a non-employee.

The significance of this is that issued equity instruments and financial liabilities not within the scope of IFRS 2 would typically fall within the scope of IAS 32 and IFRS 9, which might require a significantly different accounting treatment from that required by IFRS 2. See, for example:

- the discussion at 2.2.4.B below of the treatment in consolidated financial statements of an award with a right to put the share to the parent entity;
- the discussion at 2.2.4.G below which highlights that a share option with a foreign currency strike price is accounted for as an equity instrument under IFRS 2, but as a liability under IAS 32 and IFRS 9; and
- the discussion at 10.1.6 below of the treatment of convertible instruments issued in exchange for goods and services and accounted for under IFRS 2 rather than under IAS 32 and IFRS 9.

2.2.3 Transactions not within the scope of IFRS 2

The following transactions are outside the scope of IFRS 2:

- transactions with shareholders as a whole and with shareholders in their capacity as such (see 2.2.3.A below);
- transfers of assets in certain group restructuring arrangements (see 2.2.3.B below);
- business combinations (see 2.2.3.C below);
- combinations of businesses under common control and the contribution of a business to form a joint venture (see 2.2.3.D below); and
- transactions in the scope of IAS 32 and IFRS 9 (see 2.2.3.E below).

In addition, the scope exemptions in IFRS 2 combined with those in IAS 32 and IFRS 9 appear to have the effect that there is no specific guidance in IFRS for accounting for certain types of investment when acquired in return for shares (see 2.2.3.F below).

As noted at 2.2.2.D above, there is no exemption from IFRS 2 for share schemes aimed mainly at lower- and middle-ranking employees, referred to in different jurisdictions by terms such as 'all-employee share schemes', 'employee share purchase plans' and 'broad-based plans'.

2.2.3.A Transactions with shareholders in their capacity as such

IFRS 2 does not apply to transactions with employees (and others) purely in their capacity as shareholders. For example, an employee may already hold shares in the entity as a result of previous share-based payment transactions. If the entity then raises funds through a rights issue, for example, whereby all shareholders (including the employee) can acquire additional shares for less than the current fair value of the shares, such a transaction is not a share-based payment transaction for the purposes of IFRS 2. *[IFRS 2.4]*.

2.2.3.B Transfer of assets in group restructuring arrangements

In some group restructuring arrangements, one entity will transfer a group of net assets, which does not meet the definition of a business, to another entity in return for shares. Careful consideration of the precise facts and circumstances is needed in order to determine whether, for the separate or individual financial statements of any entity affected by the transfer, such a transfer falls within the scope of IFRS 2. If the transfer is considered primarily to be a transfer of goods by their owner in return for payment in shares then, in our view, this should be accounted for under IFRS 2. However, if the transaction is for another purpose and is driven by the group shareholder in its capacity as such, the transaction may be outside the scope of IFRS 2 (see 2.2.3.A above). Accounting for intra-group asset transfers in return for shares is considered further in Chapter 8 at 4.4.1.

2.2.3.C Business combinations

IFRS 2 does not apply to share-based payments to acquire goods (such as inventories or property, plant and equipment) as part of a business combination to which IFRS 3 applies.

However, the Interpretations Committee has clarified that in a reverse acquisition involving an entity that does not constitute a business (i.e. an asset acquisition or the provision of a service), IFRS 2 rather than IFRS 3 is likely to apply (see Chapter 9 at 14.8).[11]

Transactions in which equity instruments are issued to acquire goods as part of the net assets in a business combination are outside the scope of IFRS 2 but equity instruments granted to the employees of the acquiree in their capacity as employees (e.g. in return for continued service following the business combination) are within its scope, as are the cancellation, replacement or modification of a share-based payment transaction as a result of the business combination or other equity restructuring (see 11 and 12.8 below). *[IFRS 2.5]*.

Thus, if a vendor of an acquired business remains as an employee of that business following the business combination and receives a share-based payment for transferring control of the entity and for remaining in continuing employment, it is necessary to determine how much of the share-based payment relates to the acquisition of control (which forms part of the cost of the combination, accounted for under IFRS 3) and how much relates to the provision of future services (which is a post-combination operating expense accounted for under IFRS 2). Guidance on this issue is given in IFRS 3 – see Chapter 9 at 11.2 – and there is discussion of related issues at 2.2.4.B below.

2.2.3.D Common control transactions and formation of joint arrangements

IFRS 2 also does not apply to a combination of entities or businesses under common control (see Chapter 10), or the contribution of a business on the formation of a joint venture as defined by IFRS 11 – *Joint Arrangements* (see Chapter 12). *[IFRS 2.5]*.

It should be noted that the contribution of non-financial assets (which do not constitute a business) to a joint venture in return for shares is within the scope of IFRS 2 and the assets should be accounted for at fair value in accordance with IFRS 2 (see 2.2.2 above).

IFRS 2 does not directly address other types of transactions involving joint ventures or transactions involving associates, particularly arrangements relating to the employees of associates or joint ventures. These are discussed further at 12.9 below.

2.2.3.E Transactions in the scope of IAS 32 and IFRS 9

IFRS 2 does not apply to transactions within the scope of IAS 32 and IFRS 9 (see Chapter 45). For example, if an entity enters into a share-based payment transaction to purchase a commodity surplus to its production requirements or with a view to short-term profit taking, the contract is treated as a financial instrument under IAS 32 and IFRS 9 rather than a share-based payment transaction under IFRS 2. *[IFRS 2.6]*.

Some practical examples of scope issues involving IFRS 2 and IAS 32/IFRS 9 are discussed at 2.2.4 below.

2.2.3.F Transactions in financial assets outside the scope of IAS 32 and IFRS 9

As noted at 2.2.2 above, IFRS 2 applies to share-based payment transactions involving goods or services, with 'goods' defined so as to exclude financial assets, presumably on the basis that these fall within IAS 32 and IFRS 9. However, investments in subsidiaries, associates and joint ventures in the separate financial statements of the investing entity are financial assets as defined in IAS 32 (and hence outside the scope of IFRS 2) but are outside the scope of IFRS 9 where the entity chooses to account for them at cost (see Chapter 8 at 2.1 and Chapter 45 at 3.1).

Moreover, IFRS has no general requirements for accounting for the issue of equity instruments. Rather, consistent with the position taken by the *Conceptual Framework* that equity is a residual rather than an item 'in its own right', the amount of an equity instrument is normally measured by reference to the item (expense or asset) in consideration for which the equity is issued, as determined in accordance with IFRS applicable to that other item.

This means that, when (as is commonly the case) an entity acquires an investment in a subsidiary, associate or joint venture in return for the issue of equity instruments, there is no explicit guidance in IFRS as to the required accounting in the separate financial statements of the investor, and in particular as to how the 'cost' of such an item is to be determined. This is discussed further in Chapter 8 at 2.1.1.A.

2.2.4 Some practical applications of the scope requirements

This section addresses the application of the scope requirements of IFRS 2 to a number of situations frequently encountered in practice:

- remuneration in non-equity shares and arrangements with put rights over equity shares (see 2.2.4.A below);
- the treatment in the consolidated accounts of the parent of an equity-settled award of a subsidiary with a put option against the parent (see 2.2.4.B below);
- an increase in the counterparty's ownership interest with no change in the number of shares held (see 2.2.4.C below);
- awards for which the counterparty has paid 'fair value' (see 2.2.4.D below);
- a cash bonus which depends on share price performance (see 2.2.4.E below);
- cash-settled awards based on an entity's 'enterprise value' or other formula (see 2.2.4.F below);
- awards with a foreign currency strike price (see 2.2.4.G below);
- holding own shares to satisfy or 'hedge' awards (see 2.2.4.H below);
- shares or warrants issued in connection with a loan or other financial liability (see 2.2.4.I below);
- options over puttable instruments classified as equity under the specific exception in IAS 32 in the absence of other equity instruments (see 2.2.4.J below); and
- special discounts to certain categories of investor on a share issue (see 2.2.4.K below).

The following aspects of the scope requirements are covered elsewhere in this chapter:

- employment taxes on share-based payment transactions (see 14 below); and
- instruments such as limited recourse loans and convertible bonds that sometimes fall within the scope of IFRS 2 rather than IAS 32/IFRS 9 because of the link both to the entity's equity instruments and to goods or services received in exchange. Convertible bonds are discussed at 10.1.6 below and limited recourse loans at 15.2 below.

2.2.4.A Remuneration in non-equity shares and arrangements with put rights over equity shares

A transaction is within the scope of IFRS 2 only where it involves the delivery of an equity instrument, or cash or other assets based on the price or value of an 'equity instrument', in return for goods or services (see 2.2.1 above).

In some jurisdictions, there can be fiscal advantages in giving an employee, in lieu of a cash payment, a share that carries a right to a 'one-off' dividend, or is mandatorily redeemable, at an amount equivalent to the intended cash payment. Such a share would almost certainly be classified as a liability under IAS 32 (see Chapter 47). Payment in such a share would not fall in the scope of IFRS 2 since the consideration paid by the entity for services received is a financial liability rather than meeting the definition of an equity instrument (see the definitions in 2.2.1 above).

If, however, the amount of remuneration delivered in this way were equivalent to the value of a particular number of equity instruments issued by the entity, then the transaction would be in scope of IFRS 2 as a cash-settled share-based payment transaction, since the entity would have incurred a liability (i.e. by issuing the redeemable shares) for an amount based on the price of its equity instruments.

Similarly, if an entity grants an award of equity instruments to an employee together with a put right whereby the employee can require the entity to purchase those shares for an amount based on their fair value, both elements of that transaction are in the scope of IFRS 2 as a single cash-settled transaction (see 9 below). This is notwithstanding the fact that, under IAS 32, the share and the put right might well be analysed as a single synthetic instrument and classified as a liability with no equity component (see Chapter 47).

Differences in the classification of instruments between IFRS 2 and IAS 32 are discussed further at 1.4.1 above.

Put options over instruments that are only classified as equity in limited circumstances (in accordance with paragraphs 16A to 16B of IAS 32) are discussed at 2.2.4.J below.

2.2.4.B Equity-settled award of subsidiary with put option against the parent – treatment in consolidated accounts of parent

It is sometimes the case that a subsidiary entity grants an award over its own equity instruments and, either on the same date or later, the parent entity separately grants the same counterparty a put option to sell the equity instruments of the subsidiary to the parent for a cash amount based on the fair value of the equity instruments. Accounting for such an arrangement in the separate financial statements of the subsidiary and the parent will be determined in accordance with the general principles of IFRS 2 (see 2.2.2.A above). However, IFRS 2 does not explicitly address the accounting treatment of all such arrangements in the parent's consolidated financial statements.

In our view, the analysis differs according to whether the put option is granted during or after the vesting period and whether it relates to ordinary shares or to share options.

If the put option is granted during the vesting period (whether at the same time as the grant of the equity instruments or later), the two transactions should be treated as linked and accounted for in the consolidated financial statements as a single cash-settled transaction from the date the put option is granted. This reflects the fact that this situation is similar in group terms to a modification of an award to add a cash-settlement alternative – see 10.1.4 below.

If the put option is only granted once the equity instruments have vested, the accounting will depend on whether the equity instruments in the original share-based payment transaction are unexercised options or whether they are ordinary shares.

If they are unexercised options, the vested options remain within the scope of IFRS 2 until they are exercised (see 2.2.2.E above) and, in this case, the put option should be treated as a linked transaction. Its effect in group terms is to modify the original award from an equity- to a cash-settled transaction until final settlement date.

However, if the equity instruments are fully vested ordinary shares (whether free shares or shares from the exercise of options), rather than unexercised options, they are generally no longer within the scope of IFRS 2 as they are no different from any other ordinary shares issued by the subsidiary. In such cases, the parent entity will need to evaluate whether or not the grant of the put option, as a separate transaction which modifies the terms of certain of the subsidiary's equity instruments, falls within the scope of IFRS 2. For example, the addition of a condition that relates to one (non-controlling) shareholder of a subsidiary might indicate that it continues to be appropriate to account for the arrangement in accordance with the requirements of IFRS 2. By contrast, a modification to an entire class of ordinary shares would generally not be within the scope of IFRS 2.

A similar analysis is required in a situation where an individual sells a controlling interest in an entity for fair value and put and call options are granted over the individual's remaining non-controlling interest or over shares in the acquirer which have been given to the individual in return for the business acquired. To the extent that the exercise price of the call option depends on the fulfilment of a service condition in the period following the acquisition of the controlling interest, it is likely that the arrangement will fall within the scope of IFRS 2 with any payments contingent on future services recognised as compensation costs.

Put options over non-controlling interests that do not fall within the scope of IFRS 2 are addressed in Chapter 7 at 6.2.

2.2.4.C Increase in ownership interest with no change in number of shares held

An arrangement typically found in entities with venture capital investors is one where an employee (often part of the key management) subscribes initially for, say, 1% of the entity's equity with the venture capitalist holding the other 99%. The employee's equity interest will subsequently increase by a variable amount depending on the extent to which certain targets are met. This is achieved not by issuing new shares but by cancelling some of the venture capitalist's shares. In our view, such an arrangement falls within the scope of IFRS 2 as the employee is rewarded with an increased equity stake in the entity if certain targets are achieved. The increased equity stake is consistent with the definition in Appendix A of IFRS 2 of an equity instrument as 'a contract that evidences a residual interest ...' notwithstanding the fact that no additional shares are issued.

In such arrangements, it is often asserted that the employee has subscribed for a share of the equity at fair value. However, the subscription price paid must represent a fair value using an IFRS 2 valuation basis in order for there to be no additional IFRS 2 expense to recognise (see 2.2.4.D below).

2.2.4.D Awards for which the counterparty has paid 'fair value'

In certain situations, such as where a special class of share is issued, the counterparty might be asked to subscribe a certain amount for the share which is agreed as being its 'fair value' for taxation or other purposes. This does not mean that such arrangements fall outside the scope of IFRS 2, either for measurement or disclosure purposes, if the arrangement meets the definition of a share-based payment transaction. In many cases, the agreed 'fair value' will be lower than a fair value measured in accordance with IFRS 2 because it will reflect the impact of service and non-market performance vesting conditions which are excluded from an IFRS 2 fair value. This is addressed in more detail at 15.4.5 below.

2.2.4.E Cash bonus dependent on share price performance

An entity might agree to pay its employees a €100 cash bonus if its share price remains at €10 or more over a given period. Intuitively, this appears to be within the scope of IAS 19 – *Employee Benefits* – rather than that of IFRS 2 because the employee is not being given cash of equivalent value to a particular number of shares. However, it could be argued that it does fall within the scope of IFRS 2 on the basis that the entity has incurred a liability, and the amount of that liability is 'based on' the share price (in accordance with the definition of a cash-settled share-based payment transaction) – it is nil if the share price is below €10 and €100 if the share price is €10 or more. In our view, either interpretation is acceptable.

2.2.4.F Cash-settled awards based on an entity's 'enterprise value' or other formula

As noted at 2.2.1 above, IFRS 2 includes within its scope transactions in which the entity acquires goods or services by incurring a liability 'based on the price (or value) of equity instruments (including shares or share options) of the entity or another group entity'. Employees of an unquoted entity may receive a cash award based on the value of the equity of that entity. Such awards are typically, but not exclusively, made by venture capital investors to the management of entities in which they have invested and which they aim to sell in the medium term. Further discussion of the accounting implications of awards made in connection with an exit event may be found at 15.4 below.

More generally, where employees of an unquoted entity receive a cash award based on the value of the equity, there is no quoted share price and an 'enterprise value' has therefore to be calculated as a surrogate for it. This begs the question of whether such awards are within the scope of IFRS 2 (because they are based on the value of the entity's equity) or that of IAS 19.

In order for an award to be within the scope of IFRS 2, any calculated 'enterprise value' must represent the fair value of the entity's equity. Where the calculation uses techniques recognised by IFRS 2 as yielding a fair value for equity instruments (as discussed at 8 below), we believe that the award should be regarded as within the scope of IFRS 2.

Appendix B of IFRS 2 notes that an unquoted entity may have calculated the value of its equity based on net assets or earnings (see 8.5.3.B below). *[IFRS 2.B30]*. In our view, this is not intended to imply that it is always appropriate to do so, but simply to note that it may be appropriate in some cases.

Where, for example, the enterprise value is based on a constant formula, such as a fixed multiple of earnings before interest, tax, depreciation and amortisation ('EBITDA'), in our view it is unlikely that this will represent a good surrogate for the fair value of the equity on an ongoing basis, even if it did so at the inception of the transaction. It is not difficult to imagine scenarios in which the fair value of the equity of an entity could be affected with no significant change in EBITDA, for example as a result of changes in interest rates and effective tax rates, or a significant impairment of assets. Alternatively, there might be a significant shift in the multiple of EBITDA equivalent to fair value, for example if the entity were to create or acquire a significant item of intellectual property.

For an award by an individual entity, there is unlikely to be any significant difference in the cost ultimately recorded under IFRS 2 or IAS 19. However, the disclosure requirements of IFRS 2 are more onerous than those of IAS 19. In a group situation where the parent entity grants the award to the employees of a subsidiary, the two standards could result in different levels of expense in the books of the subsidiary because IAS 19, unlike IFRS 2, does not require the employing subsidiary to recognise an expense for a transaction which it has no direct obligation to settle and for which the parent does not allocate the cost (see Chapter 35 at 2.2.2).

The accounting treatment of awards based on the 'market price' of an unquoted subsidiary or business unit – where there is no actual market for the shares – raises similar issues about whether an equity value is being used, as discussed more fully at 15.6 below.

2.2.4.G Awards with a foreign currency strike price

Many entities award their employees options with a foreign currency strike price. This will arise most commonly in a multinational group where employees of overseas subsidiaries are granted options on terms that they can pay the option strike price in their local currency. Such awards may also arise where an entity, which has a functional currency different from that of the country in which it operates (e.g. an oil company based in the United Kingdom with a functional currency of United States dollars), grants its UK-based employees options with a strike price in pounds sterling, which is a foreign currency from the perspective of the currency of the financial statements.

Under IAS 32, as currently interpreted, such an award could not be regarded as an equity instrument because the strike price to be tendered is not a fixed amount of the reporting entity's own currency (see Chapter 47 at 5.2.3). However, under IFRS 2, as discussed at 2.2.1 above, equity instruments include options, which are defined as the right to acquire shares for a 'fixed or determinable price'. Moreover, it is quite clear from the Basis for Conclusions in IFRS 2 that an award which ultimately results in an employee receiving equity is equity-settled under IFRS 2 whatever its status under IAS 32 might be (see 1.4.1 above). Thus, an option over equity with a foreign currency strike price is an equity instrument if accounted for under IFRS 2.

The fair value of such an award should be assessed at grant date and, where the award is treated as equity-settled, should not subsequently be revised for foreign exchange movements (on the basis that the equity instrument is a non-monetary item translated using the exchange rate at the date when the fair value was measured). This applies to the separate financial statements of a parent or subsidiary entity as well as to consolidated financial statements. Where the award is treated as cash-settled, however, the periodic reassessment through profit or loss of the fair value of the award required by IFRS 2 will also need to take into account any exchange difference arising from the requirements of IAS 21 – *The Effects of Changes in Foreign Exchange Rates*.

2.2.4.H Holding own shares to satisfy or 'hedge' awards

Entities often seek to hedge the cost of share-based payment transactions, most commonly by buying their own equity instruments in the market. For example, an entity could grant an employee options over 10,000 shares and buy 10,000 of its own shares into treasury at the date that the award is made. If the award is share-settled, the entity will deliver the shares to the counterparty. If it is cash-settled, it can sell the shares to raise the cash it is required to deliver to the counterparty. In either case, the cash cost of the award is capped at the market price of the shares at the date the award is made, less any amount paid by the employee on exercise. It could of course be argued that such an arrangement is not a true hedge at all. If the share price goes down so that the option is never exercised, the entity is left holding 10,000 of its own shares that cost more than they are now worth.

Whilst these strategies may cap the cash cost of share-based payment transactions that are eventually exercised, they will not have any effect on the charge to profit or loss required by IFRS 2 for such transactions. This is because purchases and sales of own shares are accounted for as movements in equity and are therefore never included in profit or loss (see 4.1 below).

The illustrative examples of group share schemes at 12.4 and 12.5 below show the interaction of the accounting required for a holding of own shares and the requirements of IFRS 2.

2.2.4.I *Shares or warrants issued in connection with a loan or other financial liability*

As noted at 2.2.3.E above, IFRS 2 does not apply to transactions within the scope of IAS 32 and IFRS 9. However, if shares or warrants are granted by a borrower to a lender as part of a loan or other financing arrangement, the measurement of those shares or warrants might fall within the scope of IFRS 2. The determination of the relevant standard is likely to require significant judgement based on the precise terms of individual transactions. If the shares or warrants are considered to be granted by the borrower in lieu of a cash fee for services provided by the lender then IFRS 2 is likely to be the appropriate standard, but if the shares or warrants are considered instead to be part of the overall return to the lender on the financing arrangement then IAS 32 and IFRS 9 are more likely to apply.

2.2.4.J *Options over puttable instruments classified as equity under specific exception in IAS 32*

Some entities, such as certain types of trust, issue tradeable puttable instruments that are classified as equity instruments rather than as a financial liability because the entity has no other equity instruments. This classification is based on a specific exception in IAS 32 that makes it clear that such instruments are not equity instruments for the purposes of IFRS 2. *[IAS 32.16A-16B, 96C].* However, should options over such instruments granted to employees – and allowing them to obtain the instruments at a discount to the market price – be treated as cash-settled awards under IFRS 2 or are they outside the scope of IFRS 2 and within that of IAS 19?

The entity has no equity apart from the instruments classified as such under the narrow exception in IAS 32 and, in the absence of equity, the entity cannot logically issue equity instruments in satisfaction of an award to employees nor can it pay cash based on the price or value of its equity instruments. In our view, paragraph 96C of IAS 32 should be interpreted as meaning that, for the purposes of IFRS 2, such awards are not share-based payments and the appropriate standard is IAS 19 rather than IFRS 2.

Those who take the view that such options could be cash-settled share-based payments seem to rely more on the general IAS 32 definition of equity than on the more specific requirements of paragraph 96C of IAS 32 (that 'these instruments should not be considered as equity instruments under IFRS 2'). We believe that the more specific guidance should take precedence over the general definition.

2.2.4.K Special discounts to certain categories of investor on a share issue

In the context of a flotation or other equity fundraising, an entity might offer identical shares at different prices to institutional investors and to individual (retail) investors. Should the additional discount given to one class of investor be accounted for under IFRS 2 as representing unidentified goods or services received or receivable?

The Interpretations Committee was asked to clarify the accounting treatment in this area. The request submitted to the Committee referred to the fact that the final retail price could differ from the institutional price because of:

- an unintentional difference arising from the book-building process; or
- an intentional difference arising from a retail discount given by the issuer of the equity instruments as indicated in the prospectus.

For example, a discount to the institutional investor price might need to be offered to encourage retail investors to buy shares in order to meet the requirements of a particular stock exchange for an entity to have a minimum number of shareholders.

The Interpretations Committee considered whether the discount offered to retail investors in the above example involves the receipt of identifiable or unidentifiable goods or services from the retail shareholder group and, therefore, whether the discount is a share-based payment transaction within the scope of IFRS 2.

IFRS 2 was specifically amended for situations where the identifiable consideration received by the entity appears to be less than the fair value of the equity instruments granted (see 2.2.2.C above). *[IFRS 2.2, 13A]*. The Interpretations Committee noted that the application of this guidance requires judgement and consideration of the specific facts and circumstances of each transaction.

In the circumstances underlying the submission to the Interpretations Committee, the Committee observed that the entity issues shares at two different prices to two different groups of investors for the purpose of raising funds. Any difference in price between the two groups appears to relate to the existence of different markets – one accessible only to retail investors and the other accessible only to institutional investors – rather than to the receipt of additional goods or services. The only relationships involved are those between the investors and the investee entity and the investors are acting in their capacity as shareholders.

The Interpretations Committee therefore observed that the guidance in IFRS 2 is not applicable because there is no share-based payment transaction.

A distinction was drawn between the example above and a situation considered by the Interpretations Committee in 2013 (accounting for reverse acquisitions that do not constitute a business – see 2.2.3.C above). In the latter situation, a stock exchange listing received by the accounting acquirer was considered to be a service received from the accounting acquiree and to represent the difference between the fair value of the equity instruments issued and the identifiable net assets acquired. Hence an IFRS 2 expense would be required in order to recognise this difference. In the situation relating to retail and institutional investors considered above, however, there is no service element and the difference in prices for the two different types of investor is due solely to an investor-investee relationship rather than to unidentifiable goods or services received from the investors.

At its July 2014 meeting the Interpretations Committee decided not to add this matter to its agenda on the basis that sufficient guidance exists without further interpretation or the need for an amendment to a standard.[12]

In other situations, an entity might voluntarily offer a discount to one class of investor, e.g. to an institution underwriting the share issue. In our view, this type of discount is likely to require an IFRS 2 expense to be recognised unless there is evidence that separate prices, and therefore different fair values, are required for each category of investor.

However, in some cases – such as the example above where an institution provides underwriting services – it might be possible to conclude that any additional cost under IFRS 2 is actually a cost of issuing the equity instruments and should therefore be debited to equity rather than to profit or loss.

Similar considerations to those discussed in this section apply when, in advance of an IPO, a private company issues convertible instruments at a discount to their fair value in order both to attract key investors and to boost working capital. There is further discussion on convertible instruments at 10.1.6 below.

3 GENERAL RECOGNITION PRINCIPLES

The recognition rules in IFRS 2 are based on a so-called 'service date model'. In other words, IFRS 2 requires the goods or services received or acquired in a share-based payment transaction to be recognised when the goods are acquired or the services rendered. *[IFRS 2.7]*. For awards to employees (or others providing similar services), this contrasts with the measurement rules, which normally require a share-based payment transaction to be measured as at the date on which the transaction was entered into, which may be some time before or after the related services are received – see 4 to 7 below.

Where the goods or services received or acquired in exchange for a share-based payment transaction do not qualify for recognition as assets they should be expensed. *[IFRS 2.8]*. The standard notes that typically services will not qualify as assets and should therefore be expensed immediately, whereas goods will generally be recognised initially as assets and expensed later as they are consumed. However, some payments for services may be capitalised (e.g. as part of the cost of PP&E, intangible assets or inventories) and some payments for goods may be expensed immediately (e.g. where they are for items included within development costs written off as incurred). *[IFRS 2.9]*.

The corresponding credit entry is, in the case of an equity-settled transaction, an increase in equity and, in the case of a cash-settled transaction, a liability (or decrease in cash or other assets). *[IFRS 2.7]*.

The primary focus of the discussion in the remainder of this chapter is the application of these rules to transactions with employees. The accounting treatment of transactions with non-employees is addressed further at 5.1 and 5.4 below.

3.1 Vesting conditions

Under IFRS 2, the point at which a cost is recognised for goods or services depends on the concept of 'vesting'. The following definitions in Appendix A to IFRS 2 are relevant.

A share-based payment to a counterparty is said to *vest* when it becomes an entitlement of the counterparty. Under IFRS 2, a share-based payment arrangement vests when the counterparty's entitlement is no longer conditional on the satisfaction of any vesting conditions. *[IFRS 2 Appendix A]*.

A *vesting condition* is a condition that determines whether the entity receives the services that entitle the counterparty to receive cash, other assets or equity instruments of the entity, under a share-based payment arrangement. A vesting condition is either a service condition or a performance condition. *[IFRS 2 Appendix A]*.

A *service condition* is a vesting condition that requires the counterparty to complete a specified period of service during which services are provided to the entity. If the counterparty, regardless of the reason, ceases to provide service during the vesting period, it has failed to satisfy the condition. A service condition does not require a performance target to be met. *[IFRS 2 Appendix A]*. For example, if an employee is granted a share option with a service condition of remaining in employment with an entity for three years, the award vests three years after the date of grant if the employee is still employed by the entity at that date.

A *performance condition* is a vesting condition that requires:

(a) the counterparty to complete a specified period of service (i.e. a service condition); the service requirement can be explicit or implicit; and

(b) specified performance target(s) to be met while the counterparty is rendering the service required in (a).

The period of achieving the performance target(s):

(a) shall not extend beyond the end of the service period; and

(b) may start before the service period on the condition that the commencement date of the performance target is not substantially before the commencement of the service period.

A performance target is defined by reference to:

(a) the entity's own operations (or activities) or the operations or activities of another entity in the same group (i.e. a non-market condition); or

(b) the price (or value) of the entity's equity instruments or the equity instruments of another entity in the same group (including shares and share options) (i.e. a market condition).

A performance target might relate either to the performance of the entity as a whole or to some part of the entity (or part of the group), such as a division or individual employee. *[IFRS 2 Appendix A]*.

The definition of a *market condition* is included at 6.3 below.

In order for a condition to be a vesting condition – rather than a 'non-vesting' condition (see 3.2 below) – there must be a service requirement and any additional performance target must relate to the entity or to some part of the entity or group. Thus a condition that an award vests if, in three years' time, earnings per share has increased by 10% and the employee is still in employment, is a performance condition. If, however, the award becomes unconditional in three years' time if earnings per share has increased by 10%, irrespective of whether the employee is still in employment, that condition is not a performance condition but a non-vesting condition because there is no associated service requirement.

The different types of performance condition and the related accounting requirements are discussed more fully at 6 below. The distinction between vesting and non-vesting conditions is discussed at 3.2 below.

The accounting treatment in a situation where the counterparty fails to meet a service condition – a situation now explicitly covered by the definition of a service condition above – is considered in more detail at 7.4.1.A below.

In addition to the general discussion throughout section 3, specific considerations relating to awards that vest on a flotation or change of control (or similar exit event) are addressed at 15.4 below.

The definitions of 'vesting condition', 'service condition' and 'performance condition' reproduced above reflect the amendments in the IASB's *Annual Improvements to IFRSs 2010-2012 Cycle* aimed at clarifying the distinction between different types of condition attached to a share-based payment (see 1.2 above).

3.1.1 'Malus' clauses and clawback conditions

Whether as a result of an entity's own decision or in response to regulatory requirements, an increasing number of share-based payment awards include conditions that mean that the awards will only vest if there is no breach of any 'malus' clause on the part of the employee and/or the entity. Often these or other provisions are put in place to allow an entity to claw back vested awards from employees should any wrongdoing or underperformance be identified.

The impact of such clauses on the accounting treatment required by IFRS 2 depends on the precise terms of a particular arrangement. Aspects of arrangements that entities will need to consider include the following:

- whether the terms are sufficiently clear at the inception of the arrangement that there can still be a grant in IFRS 2 terms (see 5.3 below for further discussion of the requirements relating to grant date);
- whether the malus clause relates only to the actions of the individual employee (so-called 'at fault' malus) and whether the relevant period for consideration of the condition is limited to the vesting period or extends over a longer period;
- whether the malus clause relates only to the overall performance of the entity (so-called 'not at fault' malus) and, again, the applicable period during which the clause may be invoked; and
- whether the associated clawback arrangements are clear or depend on further decisions by the entity at the time the relevant 'malus' clause is invoked.

Broadly, it is likely to be the case that there will be a grant at inception provided the terms of the malus and clawback arrangements are sufficiently clear for there to be a shared understanding of the arrangements by both parties.

If the employee's ultimate entitlement to an award depends on an 'at fault' malus clause not being invoked, this is generally likely to be taken into account as part of any service vesting condition. If the condition extends beyond the usual vesting date of the award and the employee breaches the condition after the end of the vesting period, the vested awards will be treated as a cancellation under IFRS 2 (but there would be no impact on the expense already recognised for a vested award).

Depending on the precise terms, the assessment of a 'not at fault' malus clause is likely to require greater judgement. To the extent that the entity's overall performance formed part of the conditions on which the award would vest, it seems appropriate to treat the condition as part of a performance vesting condition. To the extent that a 'not at fault' malus clause could result in the clawback of an award after the end of the vesting period, there would need to be an assessment of how the identified fault or wrongdoing interacted with the position of the entity as previously determined at the end of the vesting period. The fault might relate solely to a situation that should have prevented the original vesting of the award (for example, a restatement of accounts relating to the vesting period) or it might be a more general condition relating to the ongoing performance of the entity.

If the condition extended beyond the service period, the entity would need to consider whether the award had a non-vesting condition from inception (see 3.2 below). However, given the nature of the condition, in our view it would be unlikely that there would be a significant reduction, if any, in the fair value of the award as a consequence of the non-vesting condition.

3.1.2 Vesting conditions based on an employee's performance rating

An entity may grant awards to employees that vest based on conditions that include the employee's performance rating. A performance rating would appear to meet the definition of a non-market performance condition in that it is a vesting condition that requires an employee to render service for a period of time and to achieve a specified performance rating while providing the service in employment of the entity (see 3.1 above). Performance ratings can be influenced by the judgement of the individual(s) conducting an employee's evaluation, therefore, the question often arises whether the inherent subjectivity of a performance evaluation could delay the grant date for the award (see 5.3 below). The impact of such condition on the accounting treatment required by IFRS 2 depends on the framework that is established by the entity to facilitate an employee's understanding of how their performance will be measured. A framework that clearly articulates criteria and includes more objective measures is more likely to result in a more predictive outcome and, thus likely a non-market performance condition. On the contrary, a framework that contains more subjective measures that provide less clarity and is less predictive of the outcome, would not. The following are aspects of the framework that should be considered in making the determination:

- whether the criteria is sufficiently clear at the inception of the share-based payment arrangement such that there is a mutual understanding between the entity and the employee about how it will be measured;
- whether the criteria relates only to the performance of the individual employee or the employee's performance relative to their peers, over the relevant measurement period; and
- whether the employee is able to predict the outcome under the related performance rating framework, given the set criteria.

In certain cases, the number of instruments underlying the award might vary depending on the employee's performance relative to the criteria in the framework. The entity will be required to estimate the potential outcome during the performance period and to recognise the cost for the number of instruments that the employee is expected to be entitled based on their performance rating (see 6.2.4 below).

3.2 Non-vesting conditions (conditions that are neither service conditions nor performance conditions)

3.2.1 Background

Some share-based payment transactions, particularly those with employees, require the satisfaction of conditions that are neither service conditions nor performance conditions. For example, an employee might be given the right to 100 shares in three years' time, subject only to the employee not working in competition with the reporting entity during that time. An undertaking not to work for another entity does not 'determine whether the entity receives ... services' – the employee could sit on a beach for three years and still be entitled to collect the award. Accordingly, such a condition is not regarded as a vesting condition for the purposes of IFRS 2, but is instead referred to as a 'non-vesting condition'. The accounting treatment of non-vesting conditions is discussed in detail at 6.4 below.

IFRS 2 does not explicitly define a 'non-vesting condition' (see 3.2.2 below), but uses the term to describe a condition that is neither a service condition nor a performance condition. Sometimes the condition will be wholly within the control of the counterparty and unconnected with the delivery of services, such as a requirement to save (see below). However, the identification of such conditions is not always straightforward.

The concept of a 'non-vesting condition', like much of IFRS 2 itself, had its origins as an anti-avoidance measure. It arose from a debate on how to account for employee share option schemes linked to a savings contract. In some jurisdictions, options are awarded to an employee on condition that the employee works for a fixed minimum period and, during that period, makes regular contributions to a savings account, which is then used to exercise the option. The employee is entitled to withdraw from the savings contract before vesting, in which case the right to the award lapses.

Entities applying IFRS 2 as originally issued almost invariably treated an employee's obligation to save as a vesting condition. If the employee stopped saving this was treated as a failure to meet a vesting condition and accounted for as a forfeiture, with the reversal of any expense so far recorded (see 6.1 and 6.2 below).

Some saw in this a scope for abuse of the general principle of IFRS 2 that, if a share-based payment transaction is cancelled, any amount not yet expensed for it is immediately recognised in full (see 7.4 below). The concern was that, if such a plan were 'out of the money', the employer, rather than cancel the plan (and thereby trigger an acceleration of expense) would 'encourage' the employee to stop saving (and thereby create a reversal of any expense already charged).

The broad effect of the January 2008 amendment to IFRS 2 (see 1.2 above) was to remove this perceived anomaly from the standard.

However, following the publication of the January 2008 amendment, it became apparent that the concept of the 'non-vesting' condition was not clear. This resulted in differing views on the appropriate classification of certain types of condition depending on whether or not they were considered to be measures of the entity's performance or activities and hence performance vesting conditions.

The Interpretations Committee took a number of the above issues onto its agenda as part of a wider project on vesting and non-vesting conditions. Where the issues were not addressed through the IASB's *Annual Improvements to IFRSs 2010-2012 Cycle*, there is further discussion at 3.4 below.

3.2.2 Defining a non-vesting condition

As noted at 3.1 above, IFRS 2 defines a vesting condition as a condition that determines whether the entity receives the services that entitle the counterparty to receive payment in equity or cash. Performance conditions are those that require the counterparty to complete a specified period of service and specified performance targets to be met (such as a specified increase in the entity's profit over a specified period of time).

The Basis for Conclusions to IFRS 2 adds that the feature that distinguishes a performance condition from a non-vesting condition is that the former has an explicit or implicit service requirement and the latter does not. *[IFRS 2.BC171A]*.

In issuing its *Annual Improvements to IFRSs 2010-2012 Cycle* in December 2013 the IASB considered whether a definition of 'non-vesting condition' was needed. It decided that 'the creation of a stand-alone definition ... would not be the best alternative for providing clarity on this issue'. *[IFRS 2.BC364]*. Instead, it sought to provide further clarification in the Basis for Conclusions to IFRS 2, as follows:

'...the Board observed that the concept of a non-vesting condition can be inferred from paragraphs BC170-BC184 of IFRS 2, which clarify the definition of vesting conditions. In accordance with this guidance it can be inferred that a non-vesting condition is any condition that does not determine whether the entity receives the services that entitle the counterparty to receive cash, other assets or equity instruments of the entity under a share-based payment arrangement. In other words, a non-vesting condition is any condition that is not a vesting condition.' *[IFRS 2.BC364]*.

Although it is stated that the Basis for Conclusions does not form part of IFRS 2, the IASB nonetheless appears to rely on users of the standard referring to the Basis for Conclusions in order to 'infer' the definition of a non-vesting condition.

A performance metric may be a non-vesting condition rather than a vesting condition in certain circumstances. For a condition to be a performance vesting condition, it is not sufficient for the condition to be specific to the performance of the entity. There must also be an explicit or implied service condition that extends to the end of the performance period. For example, a condition that requires the entity's profit before tax or its share price to reach a minimum level, but without any requirement for the employee to remain in employment throughout the performance period, is not a performance condition but a non-vesting condition.

Specific examples of non-vesting conditions given by IFRS 2 include:

- a requirement to make monthly savings during the vesting period;
- a requirement for a commodity index to reach a minimum level;
- restrictions on the transfer of vested equity instruments; or
- an agreement not to work for a competitor after the award has vested – a 'non-compete' agreement (see 3.2.3 below). *[IFRS 2.BC171B, IG24].*

The IASB has also clarified in the Basis for Conclusions to IFRS 2 that a condition related to a share market index target (rather than to the specific performance of the entity's own shares) is a non-vesting condition because a share market index reflects not only the performance of an entity but also that of other entities outside the group. Even where an entity's share price makes up a substantial part of the share market index, the IASB confirmed that this would still be a non-vesting condition because it reflects the performance of other, non-group, entities. *[IFRS 2.BC353-BC358].*

Thus, whilst conditions that are not related to the performance of the entity are always, by their nature, non-vesting conditions, conditions that relate to the performance of the entity may or may not be non-vesting conditions depending on whether there is also a requirement for the counterparty to render service.

As noted at 3.1 above, the definition of a performance vesting condition was clarified and expanded in the IASB's *Annual Improvements*. The amended definition includes wording intended to clarify the extent to which the period of achieving the performance target(s) needs to coincide with the service period and states that this performance period:

(a) shall not extend beyond the end of the service period; and

(b) may start before the service period on the condition that the commencement date of the performance target is not substantially before the commencement of the service period.

During the process of finalising the amended definition, the IASB moved away from a requirement for the duration of the performance condition to fall wholly within the period of the related service requirement. In response to comments on the draft version of the *Annual Improvements*, the Board decided to make a late adjustment to clarify that the start of the performance period may be before the start of the service period, provided that the commencement date of the performance target is not substantially before the commencement of the service period. As stated in the definition above, however, the performance period may not extend beyond the end of the service period.

It is interesting to note that, in the US, the EITF also considered the question of non-coterminous service and performance conditions but, unlike the IASB, reached the conclusion that a performance target that affects the vesting of a share-based payment and that could be achieved after the requisite service period is a performance condition and does not need to be reflected in the fair value of the award at grant date.[13] This was on the premise that the original definition of a performance condition in ASC 718 – *Compensation – Stock Compensation* – requires only a specified period of service. Before finalising the amendments to IFRS 2, the IASB specifically reconfirmed its own decision against the background of the US decision.[14] This is therefore an area of difference between IFRS and US GAAP.

The late adjustment by the IASB goes some way towards removing an issue that is extremely common in practice, particularly with awards made to employees under a single scheme but at various times. The IASB gives the example of an earnings per share target as one of the areas in which respondents to the draft definitions observed that there could be a problem in practice, noting that the measure of earnings per share growth set as a performance target could often be that between the most recently published financial statements at grant date and those before the vesting date. *[IFRS 2.BC341]*. However, notwithstanding the amended definition, there clearly remains an element of judgement in the interpretation of 'substantially' as used in the definition.

There is further discussion of the accounting treatment of non-vesting conditions at 6.4 below.

3.2.3 Non-compete agreements

In some jurisdictions it is relatively common to have a non-compete clause in share-based payment arrangements so that if the counterparty starts to work for a competitor within a specified timescale, i.e. he breaches the non-compete provision, he is required to return the shares (or an equivalent amount of cash) to the entity. Generally, a non-compete provision is relevant once an individual has ceased employment with the entity and so no future service is expected to be provided to the entity. However, the non-compete provision is often found in share-based payment awards entered into while the individual is still an employee of the entity and when there is no current intention for employment to cease. There are two divergent views on how such non-compete arrangements should be accounted for under IFRS 2.

The Basis for Conclusions to IFRS 2 states that 'a share-based payment vests when the counterparty's entitlement to it is no longer conditional on future service or performance conditions. Therefore, conditions such as non-compete provisions and transfer restrictions, which apply after the counterparty has become entitled to the share-based payment, are not vesting conditions.' *[IFRS 2.BC171B]*.

One view is that, under the current definitions in the standard, this means that all non-compete agreements should be treated as non-vesting conditions with the condition reflected in the grant date fair value. Another reading of paragraph BC171B is that in some situations such arrangements meet the definition of a vesting condition and this allows any IFRS 2 expense to be reversed should the condition not be met. This view is explained further below. The lack of clarity in the standard as currently drafted means that there is diversity in practice.

Those who take the view that a non-compete arrangement is not always a non-vesting condition read paragraph BC171B as distinguishing between non-compete clauses which apply after the counterparty has become entitled to an award (a non-vesting condition) and those that, by implication, apply before the counterparty has become entitled to an award (a vesting condition). Broadly, therefore, if an employee has been given shares at the start of a non-compete period he is entitled to them (a non-vesting condition), but if the shares are retained by the entity or held in escrow, the employee is not entitled to the shares until the end of the non-compete period (a vesting condition).

This view may be difficult to reconcile with IFRS 2 as currently drafted because:

- it requires the reference to 'entitlement' to an award to be read as including a contingent obligation to forfeit the share, which is not in accordance with the general approach of IFRS 2; and
- it requires the words 'which apply after the counterparty has become entitled to the share-based payment' to be read with an implied emphasis on the word 'after', so as to distinguish it from an implied (unstated) alternative scenario in which the conditions apply before the counterparty becomes entitled to the share-based payment. A more natural reading is to consider these words as describing all non-compete agreements and transfer restrictions.

The classification of a non-compete provision is a matter that had been referred to the Interpretations Committee and to the IASB (see 3.4 below).

3.3 Vesting period

The *vesting period* is the period during which all the specified vesting conditions of a share-based payment arrangement are to be satisfied. *[IFRS 2 Appendix A]*. This is not the same as the exercise period or the life of the option, as illustrated by Example 34.1 below.

Example 34.1: Meaning of 'vesting period' – award with vesting conditions only

An employee is awarded options that can be exercised at any time between three and ten years from the date of the award, provided the employee remains in service for at least three years from the date of the award. For this award, the vesting period is three years; the exercise period is seven years; and the life of the option is ten years. However, as discussed further at 8 below, for the purposes of calculating the fair value of the award under IFRS 2, the life of the award is taken as the period ending with the date on which the counterparty is most likely actually to exercise the option, which may be some time before the full ten year life expires.

It is also important to distinguish between vesting conditions and other restrictions on the exercise of options and/or trading in shares, as illustrated by Example 34.2 below.

Example 34.2: Meaning of 'vesting period' – award with vesting and non-vesting conditions

An employee is awarded options that can be exercised at any time between five and ten years from the date of the award, provided the employee remains in service for at least three years from the date of the award. In this case, the vesting period remains three years as in Example 34.1 above, provided that the employee's entitlement to the award becomes absolute at the end of three years – in other words, the employee does not have to provide any services to the entity in years 4 and 5. The restriction on exercise of the award in the period after vesting is a non-vesting condition, which would be reflected in the original valuation of the award at the date of grant (see 4, 5 and 8 below).

The accounting implications of vesting conditions, non-vesting conditions and vesting periods for equity-settled transactions are discussed in 4 to 7 below and for cash-settled transactions in 9 below.

3.4 Vesting and non-vesting conditions: issues referred to the Interpretations Committee and the IASB

In January 2010 the Interpretations Committee added to its agenda a request for clarification of the following:

- the basis on which vesting conditions, especially performance conditions, can be distinguished from non-vesting conditions, especially the distinction between a service condition, a performance condition and a non-vesting condition; and
- the interaction of multiple conditions.

The amendments to IFRS 2 published in December 2013 as part of the IASB's *Annual Improvements to IFRSs 2010-2012 Cycle* were intended to address the first bullet point together with related application issues that had been raised with the Interpretations Committee (see 3.1 and 3.2 above).

In addition to considering matters subsequently addressed by the IASB in the *Annual Improvements*, the Interpretations Committee tentatively decided at its meetings in July and September 2010[15] that a non-compete provision should be presumed to be a 'contingent feature' – a term not defined in IFRS 2.[16]

The Interpretations Committee subsequently concluded that the classification of a non-compete provision and the question of how to account for the interaction of multiple vesting conditions should be referred to the IASB.[17] In September 2011 the IASB agreed that these issues should be considered as future agenda items.[18]

The IASB launched and concluded a research project into IFRS 2 (see 1.2.1 above). The IASB decided in May 2016 not to perform further research and published a summary of the research findings in October 2018 – even though the issues continue to result in some diversity in practice (see also 3.2.3 above and 6.3.6 to 6.3.7 below).[19]

4 EQUITY-SETTLED TRANSACTIONS – OVERVIEW

4.1 Summary of accounting treatment

The detailed provisions of IFRS 2 are complex, but their key points can be summarised as follows.

(a) All equity-settled transactions are measured at fair value. However, transactions with employees are normally measured using a 'grant date model' (i.e. the transaction is recorded at the fair value of the equity instrument at the date when it is originally granted), whereas transactions with non-employees are normally measured using a 'service date model' (i.e. the transaction is recorded at the fair value of the goods or services received at the date they are received). As noted in 3 above, all transactions, however measured, are recognised using a 'service date model' (see 5 below).

(b) Where an award is made subject to future fulfilment of conditions, a 'market condition' (i.e. one related to the market price (or value) of the entity's equity instruments) or a 'non-vesting condition' (i.e. one that is neither a service condition nor a performance condition) is taken into account in determining the fair value of the award. However, the effect of conditions other than market and non-vesting conditions is ignored in determining the fair value of the award (see 3 above and 6 below).

(c) Where an award is made subject to future fulfilment of vesting conditions, its cost is recognised over the period during which the service condition is fulfilled (see 3 above and 6 below). The corresponding credit entry is recorded within equity (see 4.2 below).

(d) Until an equity instrument has vested (i.e. the entitlement to it is no longer conditional on future service) any amounts recorded are in effect contingent and will be adjusted if more or fewer awards vest than were originally anticipated to do so. However, an equity instrument awarded subject to a market condition or a non-vesting condition is considered to vest irrespective of whether or not that market or non-vesting condition is fulfilled, provided that all other vesting conditions are satisfied (see 6 below).

(e) No adjustments are made, either before or after vesting, to reflect the fact that an award has no value to the employee or other counterparty e.g. in the case of a share option, because the option exercise price is above the current market price of the share (see 6.1.1 and 6.1.3 below).

(f) If an equity instrument is cancelled, whether by the entity or the counterparty (see (g) below) before vesting, any amount remaining to be expensed is charged in full at that point (see 7.4 below). If an equity instrument is modified before vesting (e.g. in the case of a share option, by changing the performance conditions or the exercise price), the financial statements must continue to show a cost for at least the fair value of the original instrument, as measured at the original grant date, together with any excess of the fair value of the modified instrument over that of the original instrument, as measured at the date of modification (see 7.3 below).

(g) Where an award lapses during the vesting period due to a failure by the counterparty to satisfy a non-vesting condition within the counterparty's control, or a failure by the entity to satisfy a non-vesting condition within the entity's control, the lapse of the award is accounted for as if it were a cancellation (see (f) above and 6.4.3 below).

(h) In determining the cost of an equity-settled transaction under IFRS 2, whether the entity satisfies its obligations under the transaction with a fresh issue of shares or by purchasing own shares in the financial markets is completely irrelevant to the charge in profit or loss, although there is clearly a difference in the cash flows. Where own shares are purchased, they are accounted for as treasury shares under IAS 32 (see 2.2.4.H above and Chapter 47 at 9). *[IFRS 2.BC330-333]*.

The requirements summarised in (d) to (g) above can have the effect that IFRS 2 requires a cost to be recorded for an award that ultimately has no value to the counterparty, because the award either does not vest or vests but is not exercised. These rather counter-intuitive requirements of IFRS 2 are in part 'anti-abuse' provisions to prevent entities from applying a 'selective' grant date model, whereby awards that increase in value after grant date remain measured at grant date while awards that decrease in value are remeasured. This is discussed further in the detailed analysis at 5 to 7 below.

4.2 The credit entry

As noted at (c) in the summary in 4.1 above, the basic accounting entry for an equity-settled share-based payment transaction is: debit profit or loss for the period (often classified as employee costs), credit equity (classified as a transaction with owners in their capacity as owners rather than as part of other comprehensive income).

IFRS 2 does not prescribe the component of equity to which the credit should be taken. The IASB presumably adopted this non-prescriptive approach so as to ensure there was no conflict between, on the one hand, the basic requirement of IFRS 2 that there should be a credit in equity and, on the other, the legal requirements of various jurisdictions as to exactly how that credit should be allocated within equity. Depending on the requirements of the particular jurisdiction, it might be appropriate to take the credit to retained earnings or to a separate component of equity or entities may be able to make a policy choice.

Occasionally there will be a credit to profit or loss (see for instance Example 34.11 at 6.2.4 below) and a corresponding reduction in equity.

In some arrangements the share-based payment transaction will be settled in equity instruments of a subsidiary of the reporting entity. This is most commonly the case where the subsidiary is partly-owned with traded shares held by external shareholders. In the consolidated financial statements, the question arises as to whether the credit entry for such transactions should be presented as a non-controlling interest (NCI) or as part of the equity attributable to the shareholders of the parent. This is discussed further in Chapter 7 at 5.6.

5 EQUITY-SETTLED TRANSACTIONS – COST OF AWARDS

5.1 Cost of awards – overview

The general measurement rule in IFRS 2 is that an entity must measure the goods or services received, and the corresponding increase in equity, directly, at the fair value of the goods or services received, unless that fair value cannot be estimated reliably. If the fair value of the goods or services received cannot be estimated reliably, the entity must measure their value, and the corresponding increase in equity, indirectly, by reference to the fair value of the equity instruments granted. *[IFRS 2.10]*. 'Fair value' is defined as the amount for which an asset could be exchanged, a liability settled, or an equity instrument granted could be exchanged, between knowledgeable, willing parties in an arm's length transaction. *[IFRS 2 Appendix A]*. IFRS 2 has its own specific rules in relation to determining the fair value of share-based payments which differ from the more general fair value measurement requirements in IFRS 13 – *Fair Value Measurement* (see 5.5 below). *[IFRS 2.6A]*.

On their own, the general measurement principles of IFRS 2 would suggest that the reporting entity must determine in each case whether the fair value of the equity instruments granted or that of the goods or services received is more reliably determinable. However, IFRS 2 goes on to clarify that:

- in the case of transactions with employees, the fair value of the equity instruments must be used (see 5.2 below), except in those extremely rare cases where it is not possible to measure this fair value reliably, when the intrinsic value of the equity instruments may be used instead (see 5.5 below); but
- in the case of transactions with non-employees, there is a rebuttable presumption that the fair value of the goods or services provided is more reliably determinable (see 5.4 below).

Moreover, transactions with employees are measured at the date of grant (see 5.2 below), whereas those with non-employees are measured at the date when goods or services are received (see 5.4 below).

The overall position can be summarised by the following matrix.

Counterparty	**Measurement basis**	**Measurement date**	**Recognition date**
Employee	Fair value of equity instruments awarded	Grant date	Service date
Non-employee	Fair value of goods or services received	Service date	Service date

The Basis for Conclusions addresses the issue of why the accounting treatment for apparently identical transactions should, in effect, depend on the identity of the counterparty.

The main argument put forward to justify the approach adopted for transactions with employees is essentially that, once an award has been agreed, the value of the services provided pursuant to the transaction does not change significantly with the value of the award. *[IFRS 2.BC88-96]*. However, some might question this proposition, on the grounds that employees are more likely to work harder when the value of their options is rising than when it has sunk irretrievably.

As regards transactions with non-employees, the IASB offers two main arguments for the use of measurement at service date.

The first is that, if the counterparty is not firmly committed to delivering the goods or services, the counterparty would consider whether the fair value of the equity instruments at the delivery date is sufficient payment for the goods or services when deciding whether to deliver the goods or services. This suggests that there is a high correlation between the fair value of the equity instruments at the date the goods or services are received and the fair value of those goods or services. *[IFRS 2.BC126]*. This argument is clearly vulnerable to the challenge that it has no relevance where (as would more likely be the case) the counterparty is firmly committed to delivering the goods or services.

The second is that non-employees generally provide services over a short period commencing some time after grant date, whereas employees generally provide services over an extended period beginning on the grant date. This leads to a concern that transactions with non-employees could be entered into well in advance of the due date for delivery of goods or services. If an entity were able to measure the expense of such a transaction at the grant date fair value, the result, assuming that the entity's share price rises, would be to understate the cost of goods and services delivered. *[IFRS 2.BC126-127]*.

The true reason for the IASB's approach may have been political as much as theoretical. One effect of a grant date measurement model is that, applied to a grant of share options that is eventually exercised, it 'freezes' the accounting cost at the (typically) lower fair value at the date of grant. This excludes from the post-grant financial statements the increased cost and volatility that would be associated with a model that constantly remeasured the award to fair value until exercise date. The IASB might well have perceived it as a marginally easier task to persuade the corporate sector of the merits of a 'lower cost, zero volatility' approach as opposed to a 'fair value at exercise date' model (such as is used for cash-settled awards – see 9 below).

The price to be paid in accounting terms for the grant date model is that, when an award falls in value after grant date, it continues to be recognised at its higher grant date value. It is therefore quite possible that, during a period of general economic downturn, financial statements will show significant costs for options granted in previous years, but which are currently worthless. This could well lead to (in fact, sometimes groundless) accusations of rewarding management for failure.

5.2 Transactions with employees

These will comprise the great majority of transactions accounted for under IFRS 2, and include all remuneration in the form of shares, share options and any other form of reward settled in equity instruments of the entity or a member of its group.

5.2.1 Who is an 'employee'?

Given the difference between the accounting treatment of equity-settled transactions with employees and with non-employees, it is obviously important for IFRS 2 to define what is meant by employees. In fact IFRS 2 strictly refers to 'employees and others providing similar services' *[IFRS 2.11]* who are defined as individuals who render personal services to the entity and either:

(a) the individuals are regarded as employees for legal or tax purposes;

(b) the individuals work for the entity under its direction in the same way as individuals who are regarded as employees for legal or tax purposes; or

(c) the services rendered are similar to those rendered by employees.

The term encompasses all management personnel, i.e. those persons having authority and responsibility for planning, directing and controlling the activities of the entity, including non-executive directors. *[IFRS 2 Appendix A]*.

The implication of (a) and (b) above is that it is not open to an entity to argue that an individual who is not an employee as a matter of law is therefore automatically a non-employee for the purposes of IFRS 2.

The implication of (b) and (c) above is that, where a third party provides services pursuant to a share-based payment transaction that could be provided by an employee (e.g. where an external IT consultant works alongside an in-house IT team), that third party is treated as an employee rather than a non-employee for the purposes of IFRS 2.

Conversely, however, where an entity engages a consultant to undertake work for which there is not an existing in-house function, the implication is that such an individual is not regarded as an employee. In other words, in our view, the reference in (c) to 'services ... similar to those rendered by employees' is to services rendered by employees that the entity actually has, rather than to employees that the entity might have if it were to recruit them. Otherwise, the distinction in IFRS 2 between employees and non-employees would have no effect, since it would always be open to an entity to argue that it could employ someone to undertake any task instead of engaging a contractor.

Exceptionally there might be cases where the same individual is engaged in both capacities. For example, a director of the entity might also be a partner in a firm of lawyers and be engaged in that latter capacity to advise the entity on a particular issue. It might be more appropriate to regard payment for the legal services as made to a non-employee rather than to an employee.

Related questions of interpretation arise where an award is made to an employee of an associate or a joint venture (see 12.9 below).

The effect of a change of status from employee to non-employee (or *vice versa*) is addressed at 5.4.1 below.

5.2.2 Basis of measurement

As noted above, IFRS 2 requires equity-settled transactions with employees to be measured by reference to the fair value of the equity instruments granted at 'grant date' (see 5.3 below). *[IFRS 2.11]*. IFRS 2 asserts that this approach is necessary because shares, share options and other equity instruments are typically only part of a larger remuneration package, such that it would not be practicable to determine the value of the work performed in consideration for the cash element of the total package, the benefit-in-kind element, the share option element and so on. *[IFRS 2.12]*.

In essence, this is really an anti-avoidance provision. The underlying concern is that, if an entity were able to value options by reference to the services provided for them, it might assert that the value of those services was zero, on the argument that its personnel are already so handsomely rewarded by the non-equity elements of their remuneration package (such as cash and health benefits), that no additional services are (or indeed could be) obtained by granting options.

5.3 Grant date

As noted above, IFRS 2 requires equity-settled transactions with employees to be accounted for at fair value at grant date, defined as 'the date at which the entity and another party (including an employee) agree to a share-based payment arrangement, being when the entity and the counterparty have a shared understanding of the terms and conditions of the arrangement...'. *[IFRS 2 Appendix A]*.

The determination of grant date is critical to the measurement of equity-settled share-based transactions with employees, since grant date is the date at which such transactions must be measured (see 5.2.2 above).

In practice, it is not always clear when a mutual understanding of the award (and, therefore, grant date) has occurred. Issues of interpretation can arise as to:

- how precise the shared understanding of the terms of the award must be; and
- exactly what level of communication between the reporting entity and the counterparty is sufficient to ensure that there is the appropriate degree of agreement and 'shared understanding'.

As a consequence, the determination of the grant date is often difficult in practice. We discuss the following issues in more detail in the sections below:

- basic determination of grant date (see 5.3.1 below);
- the communication of awards to employees and the rendering of services in advance of grant date (see 5.3.2 below);
- awards where the exercise price or performance depends on a formula or on a future share price (see 5.3.3 below);
- awards where the exercise price is paid in shares (net settlement of award) (see 5.3.4 below);
- an award of equity instruments to a fixed monetary value (see 5.3.5 below);
- awards over a fixed pool of shares (including 'last man standing' arrangements) (see 5.3.6 below);
- awards with multiple service and performance periods (see 5.3.7 below);
- awards subject to modification or discretionary re-assessment by the entity after the original grant date (see 5.3.8 below);
- mandatory or discretionary awards to 'good leavers' (see 5.3.9 below); and
- shares issued by special purpose acquisition companies (see 5.3.10 below).

The grant date for 'matching' awards (i.e. arrangements where an additional award of shares is granted to match an initial cash bonus or award of shares) is discussed at 15.1 below.

5.3.1 Determination of grant date

IFRS 2 and the accompanying implementation guidance emphasise that a grant occurs only when all the conditions are understood and agreed by the parties to the arrangement and any required approval process has been completed. Thus, for example, if an entity makes an award 'in principle' to an employee of options whose terms are subject to review or approval by a remuneration committee or the shareholders, 'grant date' is the later date when the necessary formalities have been completed. *[IFRS 2 Appendix A, IG1-3]*.

The implementation guidance to IFRS 2 emphasises that the word 'agree' is 'used in its usual sense, which means that there must be both an offer and an acceptance of that offer'. Therefore, there cannot be a grant unless an offer by one party has been accepted by the other party. The guidance notes that agreement will be explicit in some cases (e.g. if an agreement has to be signed), but in others it might be implicit, such as when an employee starts to deliver services for the award. *[IFRS 2.IG2]*.

The counterparty's agreement to an offer might be particularly difficult to determine when it is implicit rather than explicit. For example, if an award required both the rendering of service and a subscription payment (other than a minimal one) by the employee, it is likely that the employee's agreement, and hence the grant date of the award, would coincide with the payment date – provided this occurs shortly after the offer date. If, however, the employee had the choice at the offer date of deferring payment until a much later date and could therefore decide whether the entity's subsequent performance justified his payment, then it is more likely that grant date would be the date on which the services commenced. Determination of when the counterparty has agreed to an offer will often be an area of judgement that depends on the precise facts and circumstances of a particular situation.

The implementation guidance to IFRS 2 further notes that employees may begin rendering services in consideration for an award before it has been formally ratified. For example, a new employee might join the entity on 1 January and be granted options relating to performance for a period beginning on that date, but subject to formal approval by the remuneration committee at its next quarterly meeting on 15 March. In that case, the entity would typically begin expensing the award from 1 January based on a best estimate of its fair value, but would subsequently adjust that estimate so that the ultimate cost of the award was its actual fair value at 15 March. *[IFRS 2.IG4]*. This reference to formal approval could be construed as indicating that, in fact, IFRS 2 requires not merely that there is a mutual understanding of the award (which might well have been in existence since 1 January), but also that the entity has completed all processes necessary to make the award a legally binding agreement.

In practice, many situations are much less clear-cut than the examples given in the implementation guidance. For example, if a remuneration committee has discretion over some aspects of an award and whether it vests, does that mean that there is not a shared understanding until the vesting date? Similarly, does the counterparty need to have full quantification of every aspect of an award (performance targets, exercise price, etc.) or would an understanding of the formula for calculating performance or price be sufficient?

Some of these practical interpretation issues are considered further in the sections below.

5.3.2 Communication of awards to employees and services in advance of grant date

As discussed at 5.3.1 above, the implementation guidance to IFRS 2 indicates that, in order for a grant to have been made, there must not merely be a mutual understanding of the terms – including the conditions attached to the award as discussed further in the sections that follow – but there must also be a legally enforceable arrangement. Thus, if an award requires board or shareholder approval for it to be legally binding on the reporting entity, for the purposes of IFRS 2 it has not been granted until such approval has been given, even if the terms of the award are fully understood at an earlier date. However, if services are effectively being rendered for an award from a date earlier than the grant date as defined in IFRS 2, the cost of the award should be recognised over a period starting with that earlier date. An estimate of the grant date fair value of the award is used (e.g. by estimating the fair value of the equity instruments at the end of the reporting period), for the purposes of recognising the services received during the period between service commencement date and grant date. *[IFRS 2.IG4]*.

In some situations the employee will have a valid expectation of an award, and the entity will have a corresponding obligation, based on an earlier commitment by the entity. However, it might be the case that not all of the precise terms and conditions have been finalised. In our view, provided it is possible to estimate the fair value of the arrangement, an estimated cost for services should be recognised in advance of grant date in such cases as well as in those situations where formal approval does not take place until a later date.

In situations where the entity estimates at the reporting date the grant date fair value of an award for services received in advance of grant date, the estimate is revised at subsequent reporting periods until the date of grant has been established. Once grant date has been established the entity revises the earlier estimate so that the amounts recognised for services received in respect of the grant are ultimately based on the grant date fair value of the equity instruments awarded.

The implications of the paragraph IG4 requirement are illustrated in Example 34.3 below for a situation where formal approval of an award is delayed. It is important, however, to retain a sense of proportion in considering the overall impact on the financial statements. For example, in cases where the share price is not particularly volatile, whether the grant date is, say, 1 January or 1 April may not make a great difference to the valuation of the award, particularly when set beside the range of acceptable valuations resulting from the use of estimates in the valuation model.

Example 34.3: Determination of grant date

Scenario 1

On 1 January an entity advises employees of the terms of a share award designed to reward performance over the following three years. The award is subject to board approval, which is given two months later on 1 March. Grant date is 1 March. However, the cost of the award would be recognised over the three year period beginning on 1 January, since the employees would have effectively been rendering service for the award from that date.

Scenario 2

On 1 January an entity's board resolves to implement a share scheme designed to reward performance over the following three years. The award is notified to employees two months later on 1 March. Grant date is again 1 March. *Prima facie*, in this case, the cost of the award would be recognised over the period of two years and ten months beginning on 1 March, since the employees could not be regarded as rendering service in January and February for an award of which they were not aware at that time.

However, if a similar award is made each year, and according to a similar timescale, there might be an argument that, during January and February of each year, the employees are rendering service for an award of which there is high expectation, and that the cost should therefore, as in Scenario 1, be recognised over the full three year period. The broader issue of the accounting treatment for awards of which there is a high expectation is addressed in the discussion of matching share awards at 15.1 below.

Scenario 3

On 1 January an entity advises employees of the terms of a share award designed to reward performance over the following three years. The award is subject to board approval, which is given two months later on 1 March. However, in giving such approval, the board makes some changes to the performance conditions as originally communicated to employees on 1 January. The revised terms of the award are communicated to employees a month later on 1 April. Grant date is 1 April. However, the cost of the award would be recognised over the three year period beginning on 1 January, since the employees would have effectively been rendering service for the award from that date.

Examples of situations where an employee might render service in advance of the IFRS 2 grant date because the precise conditions of an award are outstanding are considered at 5.3.3 to 5.3.7 and at 15.1 and 15.4.1 below.

5.3.3 *Exercise price or performance target dependent on a formula or future share price*

Some share plans define the exercise price not in absolute terms, but as a factor of the share price. For example, the price might be expressed as:

- a percentage of the share price at exercise date; or
- a percentage of the lower of the share price at grant date and at exercise date.

The effect of this is that, although the actual exercise price is not known until the date of exercise, both the entity and the counterparty already have a shared understanding of how the price will be calculated and it is possible to estimate the outcome on an ongoing basis without the need for additional approval or inputs.

A similar approach might be applied in the setting of performance targets i.e. they are set by reference to a formula rather than in absolute terms and so do not require further input by the entity or its remuneration committee, for example.

In order for there to be a shared understanding and a grant date, the formula or method of determining the outcome needs to be sufficiently clear and objective to allow both the entity and the counterparty to make an estimate of the outcome of the award during the vesting period. Accordingly, in our view, grant date is the date on which the terms and conditions (including the formula for calculating the exercise price or performance target) are determined sufficiently clearly and agreed by the entity and the counterparty, subject to the matters discussed at 5.3.2 above.

5.3.4 *Exercise price paid in shares (net settlement of award)*

Some share awards allow the exercise price to be paid in shares. In practical terms, this means that the number of shares delivered to the counterparty will be the total 'gross' number of shares awarded less as many shares as have, at the date of exercise, a fair value equal to the exercise price.

In our view, this situation is analogous to that in 5.3.3 above in that, whilst the absolute 'net' number of shares awarded will not be known until the date of exercise, the basis on which that 'net' number will be determined is established in advance. Accordingly, in our view, grant date is the date on which the terms and conditions (including the ability to surrender shares to a fair value equal to the exercise price) are determined and agreed by the entity and the counterparty, subject to the matters discussed at 5.3.2 above.

Such a scheme could be analysed as a share-settled share appreciation right (whereby the employee receives shares to the value of the excess of the value of the shares given over the exercise price), which is treated as an equity-settled award under IFRS 2.

Awards settled in shares net of a cash amount to meet an employee's tax obligation are considered further at 14.3 below.

5.3.5 *Award of equity instruments to a fixed monetary value*

Some entities may grant employees awards of shares to a fixed value. For example, an entity might award as many shares as are worth €100,000, with the number of shares being calculated by reference to the share price as at the vesting date. The number of shares ultimately received will not be known until the vesting date. This begs the question of whether such an award can be regarded as having been granted until that date, on the argument that it is only then that the number of shares to be delivered – a key term of the award – is known, and therefore there cannot be a 'shared understanding' of the terms of the award until that later date.

In our view, however, this situation is analogous to those in 5.3.3 and 5.3.4 above. Although the absolute number of shares awarded will not be known until the vesting date, the basis on which that number will be determined is established in advance in a manner sufficiently clear and objective to allow an ongoing estimate by the entity and by the counterparty of the number of awards expected to vest. Accordingly, in our view, grant date is the date on which the terms and conditions are determined sufficiently clearly and agreed by the entity and the counterparty, subject to the matters discussed at 5.3.2 above.

The measurement of such awards raises further issues of interpretation, which we discuss at 8.10 below.

5.3.6 Awards over a fixed pool of shares (including 'last man standing' arrangements)

An award over a fixed pool of shares is sometimes granted to a small group of, typically senior, employees. Such awards might involve an initial allocation of shares to each individual but also provide for the redistribution of each employee's shares to the other participants should any individual leave employment before the end of the vesting period. This is often referred to as a 'last man standing' arrangement.

The accounting requirements of IFRS 2 for such an arrangement are unclear. In the absence of specific guidance, several interpretations are possible and we believe that an entity may make an accounting policy choice, provided that choice is applied consistently to all such arrangements.

The first approach is based on the view that the unit of account is all potential shares to be earned by the individual employee and that, from the outset, each employee has a full understanding of the terms and conditions of both the initial award and the reallocation arrangements. This means that there is a grant on day one with each individual's award being valued on the basis of:

- that employee's initial allocation of shares; plus
- an additional award with a non-vesting condition relating to the potential reallocation of other participants' shares.

Under this approach, the departure of an employee will be accounted for as a forfeiture and any cost reversed as the service condition will not have been met (see 6.1.2 below), but the redistribution of that individual's shares to the other employees will have no accounting impact. This approach is likely to result in a total expense that is higher than the number of shares awarded multiplied by the grant date price per share.

The second approach, which we believe is consistent with US GAAP, also considers the individual employee's award to be the unit of account. Under this approach, there is an initial grant to all the employees and it is only these awards for which the fair value is measured at the date of the initial grant. Any subsequent reallocations of shares should be accounted for as a forfeiture of the original award and a completely new grant to the remaining employees, measured at the new grant date. This approach accounts only for the specific number of shares that have been allocated to the individual employee as at the end of each reporting period. No account is taken in this approach of shares that might be allocated to the individual employee in the future due to another employee's forfeiture, even though the reallocation formula is known to the individual employees at the initial grant date.

A third view, which takes a pragmatic approach in the light of the issues arising from the two approaches outlined above, is to account for the award on the basis of the total pool of shares granted rather than treating the individual employee as the unit of account. In our view this approach is likely to be materially acceptable for many arrangements where the pool of shares relates to the same small number of participants from the outset. Under this approach, the fair value of the total pool of shares is measured at the grant date (day one) with the non-vesting condition effectively ignored for valuation purposes. Subsequent forfeitures and reallocations would have no effect on the accounting.

There is a distinction between the 'last man standing' arrangement described above and a situation where an entity designates a fixed pool of shares to be used for awards to employees but where the allocation of leavers' shares is discretionary rather than predetermined. In this situation, the valuation of the initial award would not take account of any potential future reallocations. If an employee left employment during the vesting period, that individual's award would be accounted for as a forfeiture and any reallocation of that individual's shares would be accounted for as a new grant with the fair value determined at the new grant date (i.e. a similar accounting treatment to that in approach two above).

A further type of award relating to a fixed pool of shares is one where an entity makes an award over a fixed number or percentage of its shares to a particular section of its workforce, the final allocation of the pool being made to those employed at the vesting date. In such an arrangement, some employees will typically join and leave the scheme during the original vesting period which will lead to changes in each employee's allocation of shares. Although employees are aware of the existence, and some of the terms, of the arrangement at the outset, the fact that there is no objective formula (see 5.3.3 to 5.3.5 above) for determining the number of shares that each individual will ultimately receive means that there is no grant under IFRS 2 until the date of final allocation. However, because the employees render service under the arrangement in advance of the grant date – either from day one or from a later joining date – the entity should estimate the fair value of the award to each individual from the date services commence and subsequently update it at each reporting period. The fair value estimated is expensed over the full service period of the award with a final truing up of the expense to the fair value of the award at the eventual grant date (see 5.3.2 above).

This has the effect that, where an entity decides to set aside a bonus pool of a fixed amount of cash, say £1 million, with the allocation to individual employees to be made at a later date, there is a known fixed cost of £1 million. However, where an entity decides to set aside a bonus pool of a fixed number of shares, with the allocation to individual employees to be made at a later date, the final cost is not determined until the eventual grant date.

5.3.7 Awards with multiple service and performance periods

Entities frequently make awards that cover more than one reporting period, but with different performance conditions for each period, rather than a single cumulative target for the whole vesting period. In such cases, the grant date may depend on the precision with which the terms of the award are communicated to employees, as illustrated by Example 34.4 below.

Example 34.4: Awards with multiple service and performance periods

Scenario 1

At the beginning of year 1, an entity enters into a share-based payment arrangement with an employee. The employee is informed that the maximum potential award is 40,000 shares, 10,000 of which will vest at the end of year 1, and 10,000 more at the end of each of years 2 to 4. Vesting of each of the four tranches of 10,000 shares is conditional on:

(a) the employee having been in continuous service until the end of each relevant year; and

(b) revenue targets for each of those four years, as communicated to the employee at the beginning of year 1, having been attained.

In this case, the terms of the award are clearly understood by both parties at the beginning of year 1, and this is therefore the grant date under IFRS 2 (subject to issues such as any requirement for later formal approval – see 5.3 to 5.3.2 above). The cost of the award would be recognised using a 'graded' vesting approach – see 6.2.2 below.

Scenario 2

At the beginning of year 1, an entity enters into a share-based payment arrangement with an employee. The employee is informed that the maximum potential award is 40,000 shares, 10,000 of which will vest at the end of year 1, and 10,000 more at the end of each of years 2 to 4. Vesting of each of the four tranches of 10,000 shares is conditional on:

(a) the employee having been in continuous service until the end of each relevant year; and

(b) revenue targets for each of those four years, to be communicated to the employee at the beginning of each relevant year in respect of that year only, having been attained.

In this case, in our view, at the beginning of year 1 there is a clear shared understanding only of the terms of the first tranche of 10,000 shares that will potentially vest at the end of year 1. There is no clear understanding of the terms of the tranches potentially vesting at the end of years 2 to 4 because their vesting depends on revenue targets for those years which have not yet been set.

Accordingly, each of the four tranches of 10,000 shares has a separate grant date (and, therefore, a separate measurement date) – i.e. the beginning of each of years 1, 2, 3 and 4, and a vesting period of one year from the relevant grant date.

In this type of situation, the entity would also need to consider whether, in the absence of a grant date, the employee was nonetheless rendering services in advance of the grant date. However, if targets are unquantified and do not depend on a formula, for example, then it is likely to be difficult to estimate an expense in advance of the grant date (see 5.3.2 above).

A variation on the above two scenarios which is seen quite frequently in practice is an award where the target is quantified for the first year and the targets for subsequent years depend on a formula-based increase in the year 1 target. The formula is set at the same time as the year 1 target. Whether the accounting treatment for scenario 1 above or scenario 2 above is the more appropriate in such a situation is, in our view, a matter of judgement depending on the precise terms of the arrangement (see 5.3.3 above).

5.3.8 Awards subject to modification by entity after original grant date

As noted at 5.3.1 above, some employee share awards are drafted in terms that give the entity discretion to modify the detailed terms of the scheme after grant date. Some have questioned whether this effectively means that the date originally determined as the 'grant date' is not in fact the grant date as defined in IFRS 2, on the grounds that the entity's right to modify means that the terms are not in fact understood by both parties in advance.

In our view, this is very often not an appropriate analysis. If it were, it could also mean that, in some jurisdictions, nearly all share-based awards to employees would be required to be measured at vesting date, which clearly was not the IASB's intention.

However, the assessment of whether or not an intervention by the entity after grant date constitutes a modification is often difficult. Some situations commonly encountered in practice are considered in the sections below. See also the discussion at 3.1.1 above relating to the clawback of awards.

5.3.8.A Significant equity restructuring or transactions

Many schemes contain provisions designed to ensure that the value of awards is maintained following a major capital restructuring (such as a share split or share consolidation – see 7.8 below) or a major transaction with shareholders as a whole (such as the insertion of a new holding company over an existing group (see 12.8 below), a major share buyback or the payment of a special dividend). These provisions will either specify the adjustments to be made in a particular situation or, alternatively, may allow the entity to make such discretionary adjustments as it sees fit in order to maintain the value of awards. In some cases the exercise of such discretionary powers may be relatively mechanistic (e.g. the adjustment of the number of shares subject to options following a share split). In other cases, more subjectivity will be involved (e.g. in determining whether a particular dividend is a 'special' dividend for the purposes of the scheme).

In our view, where the scheme rules specify the adjustments to be made or where there is a legal requirement to make adjustments in order to remedy any dilution that would otherwise arise, the implementation of such adjustments would not result in the recognition of any incremental IFRS 2 fair value. This assumes that the adjustment would simply operate on an automatic basis to put the holders of awards back to the position that they would have been in had there not been a restructuring and hence there would be no difference in the fair value of the awards before and after the restructuring (or other specified event).

However, where there is no such explicit requirement in the scheme rules or under relevant legislation, we believe that there should be a presumption that the exercise of the entity's discretionary right to modify is a 'modification' as defined in IFRS 2. In such a situation, the fair values before and after the modification may differ and any incremental fair value should be expensed over the remaining vesting period (see 7.3 below).

5.3.8.B Interpretation of general terms

More problematic might be the exercise of any discretion by the entity or its remuneration committee to interpret the more general terms of a scheme in deciding whether performance targets have been met and therefore whether, and to what extent, an award should vest. Suppose, for example, that an entity makes an award to its executives with a market performance condition based on total shareholder return (TSR) with a maximum payout if the entity is in the top quartile of a peer group of 100 entities (i.e. it is ranked between 1 and 25 in the peer group).

It might be that the entity is ranked 26 until shortly before the end of the performance period, at which point the entity ranked 25 suddenly announces that it is in financial difficulties and ceases trading shortly afterwards. This then means that the reporting entity moves up from 26 to 25 in the rankings. However, the entity might take the view that, in the circumstances, it could not be considered as having truly been ranked 25 in the peer group, so that a maximum payout is not justified.

In this case, the entity's intervention might be considered to be a modification. However, as the effect would be to reduce the fair value of the award, it would have no impact on the accounting treatment (see 7.3.2 below).

If such an intervention were not regarded as a modification, then the results might be different depending on the nature of the award. Where an award is subject to a market condition, as here, or to a non-vesting condition, an expense might well have to be recognised in any event, if all the non-market vesting conditions (e.g. service) were satisfied – see 6.3 and 6.4 below.

However, suppose that the award had been based on a non-market performance condition, such as an EPS target, which was met, but only due to a gain of an unusual, non-recurring nature, such as the revaluation of PP&E for tax purposes, giving rise to a deferred tax credit. The remuneration committee concludes that this should be ignored, with the effect that the award does not vest. If this is regarded as the exercise of a pre-existing right to ensure that the award vests only if 'normal' EPS reaches a given level, then there has been no modification. On this analysis, the award has not vested, and any expense previously recognised would be reversed. If, however, the committee's intervention is regarded as a modification, it would have no impact on the accounting treatment in this particular case, as the effect would not be beneficial to the employee and so the modification would be ignored under the general requirements of IFRS 2 relating to modifications (see 7.3.2 below).

5.3.8.C Discretion to make further awards

Some schemes may give the entity the power to increase an award in circumstances where the recipient is considered to have delivered exceptional performance, or some such similar wording. In our view, unless the criteria for judging such exceptional performance are so clear as to be, in effect, performance conditions under IFRS 2, the presumption should be that any award made pursuant to such a clause is granted, and therefore measured, when it is made. We note at 15.1 below that there may be circumstances where an award described as 'discretionary' may not truly be so, since the entity has created an expectation amounting to an obligation to make the award. However, we believe that it would be somewhat contradictory to argue that such expectations had been created in the case of an award stated to be for (undefined) exceptional performance only.

5.3.9 'Good leaver' arrangements

In some jurisdictions it is common for awards to contain a so-called 'good leaver' clause. A 'good leaver' clause is one which makes provision for an employee who leaves employment before the end of the full vesting period of the award to receive some or all of the award on leaving (see 5.3.9.A below).

In other cases, the original terms of an award will either make no reference to 'good leavers' or will not be sufficiently specific to allow the accounting treatment on cessation of employment to be an automatic outcome of the original terms of the scheme. In such cases, and in situations where awards are made to leavers on a fully discretionary basis, the approach required by IFRS 2 differs from that required where the original terms are clear about 'good leaver' classification and entitlement (see 5.3.9.B below).

In some jurisdictions awards are structured in a way which allows the majority of participants, rather than just a few specified categories of 'good leaver', to retain all or part of an award if they leave employment during the vesting period (see 5.3.9.C below).

We refer throughout this section on 'good leavers' to an employee leaving employment, but similar considerations apply when an individual automatically becomes entitled to an award before the end of the original vesting period due to other reasons specified in the terms of the agreement, e.g. attaining a certain age or achieving a specified length of service, even if the individual remains in employment after the relevant date. In these situations, the date of full entitlement is the date on which any services – and therefore expense recognition – cease for IFRS 2 purposes.

Arrangements for a good leaver to receive all, or part, of an award on leaving employment should be distinguished from a situation where an employee leaves with no award and where forfeiture accounting is likely to apply (see 7.4.1.A below).

5.3.9.A Provision for 'good leavers' made in original terms of award

In some cases the types of person who are 'good leavers' may be explicitly defined in the original terms of the arrangement (common examples being persons who die or reach normal retirement age before the end of the full vesting period, or who work for a business unit that is sold or closed during the vesting period). In other cases, the entity may have the discretion to determine on a case-by-case basis whether a person should be treated as a 'good leaver'.

In addition, some schemes may specify the entitlement of a 'good leaver' on leaving (e.g. that the leaver receive a portion of the award *pro rata* to the extent that the performance conditions have been met), whereas others leave the determination of the award to the entity at the time that the employee leaves.

Whichever situation applies, any expense relating to an award to a good leaver must be fully recognised by the leaving date because, at that point, the good leaver ceases to provide any services to the entity and any remaining conditions attached to the award will be treated as non-vesting rather than vesting conditions (see 3.2 above).

In our view, an award which vests before the end of the original vesting period due to the operation of a 'good leaver' clause is measured at the original grant date only where, under the rules of the scheme as understood by both parties at the original grant date, the award is made:

- to a person clearly identified as a 'good leaver'; and
- in an amount clearly quantified or quantifiable.

Where, as outlined above, the rules of the scheme make clear the categories of 'good leaver' and their entitlement, the entity should assess at grant date how many good leavers there are likely to be and to what extent the service period for these particular individuals is expected to be shorter than the full vesting period. The grant date fair value of the estimated awards to good leavers should be separately determined, where significant, and the expense relating to good leavers recognised over the expected reduced vesting period between grant date and leaving employment. In this situation the entity would re-estimate the number of good leavers and adjust the cumulative expense at each reporting date. This would be a change of estimate rather than a modification of the award as it would all be in accordance with the original terms and would require no discretionary decisions on the part of the entity. We would not generally expect an entity to have significant numbers of good leavers under such an arrangement.

It is important to draw a clear distinction between the IFRS 2 accounting on a straight-line basis over a reduced vesting period in the above case and that on a graded vesting basis in a situation of broader entitlement as outlined at 5.3.9.C below.

5.3.9.B Discretionary awards to 'good leavers'

At 5.3.9.A above we discuss awards where the arrangements for leavers are clear as at the original grant date of the award. However, where – as is more usually the case – the entity determines only at the time that the employee leaves either that the employee is a 'good leaver' or the amount of the award, grant date or modification date (see further below) should be taken as the later of the date on which such determination is made or the date on which the award is notified to the employee. This is because the employee had no clear understanding at the original grant date of an automatic entitlement to equity instruments other than through full vesting of the award at the end of the full service period.

In our view, an entity should assess the appropriate accounting treatment based on the particular facts and circumstances and the extent to which the discretionary award is linked to the original award. The discretionary award at the time of leaving is considered to be either a modification of an original award in the employee's favour (for example, where vesting conditions are waived to allow an individual to keep an award) or the forfeiture of the original award and the granting of a completely new award on a discretionary basis (see 7.3 and 7.5 below).

In some cases, a good leaver will be allowed, on a discretionary basis, to keep existing awards that remain subject to performance conditions established at the original grant date. In this situation, any conditions that were previously treated as vesting conditions will become non-vesting conditions following the removal of the service requirement (see 3.1 and 3.2 above). This will be the case whether the discretionary arrangement is accounted for as the forfeiture of the old award plus a new grant or as a modification of the original award.

The non-vesting conditions will need to be reflected in the measurement of the fair value of the award as at the date of modification or new grant (although the non-vesting conditions alone will not result in any incremental fair value). Any fair value that is unrecognised as at the date of the good leaver ceasing employment will need to be expensed immediately as there is no further service period over which to recognise the expense.

There is further discussion of modifications at 7.3 below and of replacement and *ex gratia* awards granted on termination of employment at 7.5 below.

5.3.9.C Automatic full or pro rata entitlement on leaving employment

In some jurisdictions entities establish schemes where a significant number of the participants will potentially leave employment before the end of the full vesting period and will be allowed to keep a *pro rata* share of the award. This gives rise to a much broader category of employee than the small number of good leavers that one would generally expect under a scheme where 'good leaver' refers only to employees who die, retire or work for a business unit that is sold or closed (see 5.3.9.A above).

The substance of an arrangement where significant numbers of employees are expected to leave with a *pro rata* entitlement is that the entire award to all participants vests on a graded basis over the vesting period as a whole. So, for example, an arrangement that gives employees 360 shares at the end of three years but, whether under the rules of the scheme or by precedent, allows the majority of leavers to take a *pro rata* share – based on the number of months that have elapsed – at their date of departure, should be treated as vesting at the rate of 10 shares per month for all employees. Such an arrangement should be accounted for using the graded vesting approach illustrated at 6.2.2 below.

Some take the view that the situation outlined in the previous paragraph does not require graded vesting and that a straight-line approach may be taken because the award only vests *pro rata* if an employee leaves employment. Supporters of this view argue that the requirement to leave employment in order to receive the award before the end of the full vesting period is itself a substantive condition over and above the requirement to provide ongoing service. If an employee remains in employment the award only vests on completion of three years' service and there is no earlier entitlement on a *pro rata* basis. Although this treatment has some appeal, in our view it is difficult to reconcile to the standard and is not therefore an appropriate alternative accounting treatment to the graded approach outlined above.

In other cases, rather than just a *pro rata* apportionment, any good leaver will be allowed to keep the entire award regardless of when they leave employment. If this is the case, and in substance there is no required minimum service period attached to the award, then the award should be treated as immediately vested in all employees and fully expensed at the grant date.

5.3.10 Special purpose acquisition companies ('SPACs')

IPOs and trade sales may be achieved through the medium of special purpose acquisition companies ('SPACs'). The detailed features of SPACs may vary, but common features tend to be:

- The SPAC is established by a small number of founders, typically with expertise in selecting attractive targets for flotation or sale. The founder shares contain a term to the effect that, if a target is eventually identified and floated or sold, the holders of the founder shares will receive a greater proportion of any proceeds than other shareholders at the time of flotation.
- At a later date, other (non-founder) shareholders invest. This is frequently achieved by an IPO of the SPAC. It is typically the case that, if a specific target is not identified and agreed by a required majority of non-founder shareholders, within a finite timescale, the other (non-founder) shareholders will have their funds returned.
- The SPAC seeks a target which is then approved (or not, as the case may be) by the required majority of non-founder shareholders.

The three stages outlined above have given rise to three interpretations as to the grant date for IFRS 2 purposes.

The first view is that there is no shared understanding until the specific target is identified and agreed (the third stage above). Holders of this view argue that the substance of the founder shareholders' interest is economically equivalent to an award of shares in any target finally approved. Therefore, until the target is finally approved, there is no clarity as to the nature and value of the award to the founder shareholders.

The second view is that a shared understanding occurs at the point at which the non-founder shareholders invest (i.e. the second stage above). Holders of this view argue that a share-based payment can only occur when there has been a transfer of value from the non-founder shareholders to the founder shareholders and this cannot occur until there are some non-founder shareholders in place. However, once those non-founder shareholders are in place, there is a shared understanding that – if a transaction is subsequently approved – there will be a benefit for founder shareholders.

The third view is that a shared understanding occurs on the issue of the founder shares (i.e. the first stage above). Holders of this view argue that at that point there is a shared understanding that there will be a benefit for founder shareholders if non-founder shareholders are subsequently introduced and a transaction is subsequently approved. The benefit for founder shareholders consists both in seeking further investors and in identifying a suitable target. The founder shareholders will be actively rendering service towards these goals from the outset.

The IFRS Interpretations Committee conducted some initial outreach research into how SPACs are treated in practice, but the question has not been formally discussed to date. Until such time as additional guidance is given, it seems that the diversity in practice outlined above will remain and entities should use judgement to determine an appropriate grant date based on the specific terms of the arrangement.

5.4 Transactions with non-employees

In accounting for equity-settled transactions with non-employees, the entity must adopt a rebuttable presumption that the value of the goods or services received provides the more reliable indication of the fair value of the transaction. The fair value to be used is that at the date on which the goods are obtained or the services rendered. *[IFRS 2.13].* This implies that, where the goods or services are received on a number of dates over a period, the fair value at each date should be used, although in the case of a relatively short period there may be no great fluctuation in fair value.

If 'in rare cases' the presumption is rebutted, the entity may use as a surrogate measure the fair value of the equity instruments granted, but as at the date when the goods or services are received, not the original grant date. However, where the goods or services are received over a relatively short period where the share price does not change significantly, an average share price can be used in calculating the fair value of equity instruments granted. *[IFRS 2.13, IG5, IG6-7].*

This contrasts with US GAAP[20] which requires the fair value of goods or services received from non-employees to be measured at grant date of the equity-instruments to be received, rather than based on the fair value at the date the goods are obtained or services are rendered.

5.4.1 Effect of change of status from employee to non-employee (or vice versa)

IFRS 2 does not give specific guidance on how to account for an award when the status of the counterparty changes from employee to non-employee (or *vice versa*) but, in all other respects, the award remains unchanged. In our view, the accounting following the change of status will depend on the entity's assessment of whether or not the counterparty is performing the same or similar services before and after the change of status.

If it is concluded that the counterparty is providing the same or similar services before and after the change of status, the measurement approach remains unchanged.

However, if the services provided are substantially different, the accounting following the change of status will be determined by the counterparty's new status, as follows:

- For a change from non-employee to employee status, the expense for periods following the change should be measured as if the award had been granted at the date of change of status. This revised measurement only applies to the expense for the portion of the award that vests after the change of status and there is no effect on the expense recognised in prior periods.
- For a change from employee to non-employee status, the expense for periods following the change should be measured on the basis of the fair value of the counterparty's services as they are received – if this is reliably determinable. Otherwise, the fair value used is that of the equity instruments granted but measured at the date the services are received (see 5.4 above). There is no effect on the expense recognised in prior periods.

If the status of the counterparty changes and the terms of the award are modified in order to allow the award to continue to vest, the modification and change of status should be assessed in accordance with the general principles in IFRS 2 relating to the modification of awards (see 7.3 below).

5.5 Determining the fair value of equity instruments

As discussed in 5.2 and 5.4 above, IFRS 2 requires the following equity-settled transactions to be measured by reference to the fair value of the equity instruments issued rather than that of the goods or services received:

- all transactions with employees (except where it is impossible to determine fair value – see below); and
- transactions with non-employees where, in rare cases, the entity rebuts the presumption that the fair value of goods or services provided is more reliably measurable.

There will also be situations where the identifiable consideration received (if any) from non-employees appears to be less than the fair value of consideration given. In such cases, the cost of the unidentifiable goods or services received, if any, must be accounted for in accordance with IFRS 2 by determining the fair value of the equity instruments. This requirement is discussed at 2.2.2.C above.

For all transactions measured by reference to the fair value of the equity instruments granted, IFRS 2 requires fair value to be measured at the 'measurement date' – i.e. grant date in the case of transactions with employees and service date in the case of transactions with non-employees. *[IFRS 2 Appendix A]*. Fair value should be based on market prices if available. *[IFRS 2.16]*. In the absence of market prices, a valuation technique should be used to estimate what the market price would have been on the measurement date in an arm's length transaction between informed and willing parties. The technique used should be a recognised technique and incorporate all factors that would be taken into account by knowledgeable and willing market participants. *[IFRS 2.17]*.

Appendix B to IFRS 2 contains more detailed guidance on valuation, which is discussed at 8 below. *[IFRS 2.18]*. IFRS 2 also deals with those 'rare' cases where it is not possible to value equity instruments reliably, where an intrinsic value approach may be used. This is more likely to apply to awards of options than to awards of shares and is discussed further at 8.8 below.

IFRS 2 rather confusingly states that the fair value of equity instruments granted must take into account the terms and conditions on which they were granted, but this requirement is said to be 'subject to the requirements of paragraphs 19-22'. *[IFRS 2.16]*. When those paragraphs are consulted, a somewhat different picture emerges, since they draw a distinction between:

- non-vesting conditions (i.e. those that are neither service conditions nor performance conditions);
- vesting conditions which are market conditions (i.e. those related to the entity's share price); and
- other vesting conditions (i.e. service and non-market performance conditions).

These are discussed in more detail at 6.2 to 6.4 and at 8 below, but the essential difference is that, while non-vesting conditions and market conditions must be taken into account in any valuation, other vesting conditions must be ignored. *[IFRS 2.19-21A]*. As we explain in the more detailed discussion later, these essentially arbitrary distinctions originated in part as anti-avoidance measures.

The 'fair value' of equity instruments under IFRS 2 therefore takes account of some, but not all, conditions attached to an award rather than being a 'true' fair value.

The approach to determining the fair value of share-based payments continues to be that specified in IFRS 2 and share-based payments fall outside the scope of IFRS 13 which applies more generally to the measurement of fair value under IFRSs (see Chapter 14). *[IFRS 2.6A]*.

5.5.1 Reload features

A 'reload feature' is a feature in a share option that provides for an automatic grant of additional share options (reload options) whenever the option holder exercises previously granted options using the entity's shares, rather than cash, to satisfy the exercise price. *[IFRS 2 Appendix A]*. IFRS 2 requires reload features to be ignored in the initial valuation of options that contain them. Instead any reload option should be treated as if it were a newly granted option when the reload conditions are satisfied. *[IFRS 2.22]*. This is discussed further at 8.9 below.

6 EQUITY-SETTLED TRANSACTIONS – ALLOCATION OF EXPENSE

6.1 Overview

Equity-settled transactions, particularly those with employees, raise particular accounting problems since they are often subject to vesting conditions (see 3.1 above) that can be satisfied only over an extended vesting period. This raises the issue of whether a share-based payment transaction should be recognised:

- when the relevant equity instrument is first granted;
- when it vests;
- during the vesting period; or
- during the life of the option.

An award of equity instruments that vests immediately is presumed, in the absence of evidence to the contrary, to relate to services that have already been rendered, and is therefore expensed in full at grant date. *[IFRS 2.14]*. This may lead to the immediate recognition of an expense for an award to which the employee may not be legally entitled for some time, as illustrated in Example 34.5.

Example 34.5: Award with non-vesting condition only

An entity grants a director share options, exercisable after three years provided the director does not compete with the reporting entity for a period of at least three years. The 'non-compete' clause is considered to be a non-vesting condition (see 3.2 above and 6.4 below). As this is the only condition to which the award is subject, the award has no vesting conditions and therefore vests immediately. The fair value of the award at the date of grant, including the effect of the 'non-compete' clause, is determined to be €150,000. Accordingly, the entity immediately recognises a cost of €150,000.

This cost can never be reversed, even if the director goes to work for a competitor and loses the award. This is discussed more fully at 3.2.3 above and at 6.1.2 and 6.4 below.

Where equity instruments are granted subject to vesting conditions (as in many cases they will be, particularly where payments to employees are concerned), IFRS 2 creates a presumption that they are a payment for services to be received in the future, during the 'vesting period', with the transaction being recognised during that period, as illustrated in Example 34.6. *[IFRS 2.15]*.

Example 34.6: Award with service condition only

An entity grants a director share options on condition that the director remain in employment for three years. The requirement to remain in employment is a service condition, and therefore a vesting condition, which will take three years to fulfil. The fair value of the award at the date of grant, ignoring the effect of the vesting condition, is determined to be €300,000. The entity will record a cost of €100,000 a year in profit or loss for three years, with a corresponding increase in equity.

In practice, the calculations required by IFRS 2 are unlikely to be as simple as that in Example 34.6. In particular:

- the final number of awards that vest cannot be known until the vesting date (because employees may leave before the vesting date, or because relevant performance conditions may not be met); and/or
- the length of the vesting period may not be known in advance (since vesting may depend on satisfaction of a performance condition with no, or a variable, time-limit on its attainment).

In order to deal with such issues, IFRS 2 requires a continuous re-estimation process as summarised in 6.1.1 below.

6.1.1 The continuous estimation process of IFRS 2

The overall objective of IFRS 2 is that, at the end of the vesting period, the cumulative cost recognised in profit or loss (or, where applicable, included in the carrying amount of an asset), should represent the product of:

- the number of equity instruments that have vested, or would have vested, but for the failure to satisfy a market condition (see 6.3 below) or a non-vesting condition (see 6.4 below); and
- the fair value (excluding the effect of any non-market vesting conditions, but including the effect of any market conditions or non-vesting conditions) of those equity instruments at the date of grant.

It is essential to appreciate that the 'grant date' measurement model in IFRS 2 seeks to capture the value of the contingent right to shares promised at grant date, to the extent that that promise becomes (or is deemed by IFRS 2 to become – see 6.1.2 below) an entitlement of the counterparty, rather than the value of any shares finally delivered. Therefore, if an option vests, but is not exercised because it would not be in the counterparty's economic interest to do so, IFRS 2 still recognises a cost for the award.

In order to achieve this outcome, IFRS 2 requires the following process to be applied:

(a) at grant date, the fair value of the award (excluding the effect of any service and non-market performance vesting conditions, but including the effect of any market performance conditions or non-vesting conditions) is determined;

(b) at each subsequent reporting date until vesting, the entity calculates a best estimate of the cumulative charge to profit or loss at that date, being the product of:
    (i) the grant date fair value of the award determined in (a) above;
    (ii) the current best estimate of the number of awards that will vest (see 6.1.2 below); and
    (iii) the expired portion of the vesting period;
(c) the charge (or credit) to profit or loss for the period is the cumulative amount calculated in (b) above less the amounts already charged in previous periods. There is a corresponding credit (or debit) to equity; *[IFRS 2.19-20]*
(d) once the awards have vested, no further accounting adjustments are made to the cost of the award, except in respect of certain modifications to the award – see 7 below; and
(e) if a vested award is not exercised, an entity may (but need not) make a transfer between components of equity – see 6.1.3 below.

The overall effect of this process is that a cost is recognised for every award that is granted, except when it is forfeited, as that term is defined in IFRS 2 (see 6.1.2 below). *[IFRS 2.19]*.

6.1.2 Vesting and forfeiture

In normal English usage, and in many share scheme documents, an award is described as 'vested' when all the conditions needed to earn it have been met, and as 'forfeited' where it lapses before vesting because one or more of the conditions has not been met.

IFRS 2 uses the term 'forfeiture' in a much more restricted sense to mean an award that does not vest in IFRS 2 terms. This is a particularly complex aspect of IFRS 2, which is discussed in more detail at 6.2 to 6.4 below. Essentially:

- where an award is subject only to vesting conditions other than market conditions, failure to satisfy any one of the conditions is treated as a forfeiture by IFRS 2;
- where an award is subject to both
    - vesting conditions other than market conditions, and
    - market conditions and/or non-vesting conditions,

  failure to satisfy any one of the vesting conditions other than market conditions is treated as a forfeiture by IFRS 2. Otherwise (i.e. where all the vesting conditions other than market conditions are satisfied), the award is deemed to vest by IFRS 2 even if the market conditions and/or non-vesting conditions have not been satisfied; and
- where an award is subject only to non-vesting conditions, it is always deemed to vest by IFRS 2.

Where an award has been modified (see 7.3 below) so that different vesting conditions apply to the original and modified elements of an award, forfeiture will not apply to the original award if the service and non-market performance conditions attached to that element have been met. This will be the case even if the service and non-market performance conditions attached to the modified award have not been met and so the modified award is considered to have been forfeited (resulting in the reversal of any incremental expense relating to the modification). Examples 34.23 and 34.24 at 7.3 below illustrate this point.

As a result of the interaction of the various types of condition, the reference in the summary at 6.1.1 above to the 'best estimate of the number of awards that will vest' really means the best estimate of the number of awards for which it is expected that all service and non-market vesting conditions will be met.

In practice, however, it is not always clear how that best estimate is to be determined, and in particular what future events may and may not be factored into the estimate. This is discussed further at 6.2 to 6.4 and at 7.6 below.

6.1.3 Accounting after vesting

Once an equity-settled transaction has vested (or, in the case of a transaction subject to one or more market or non-vesting conditions, has been treated as vested under IFRS 2 – see 6.1.2 above), no further accounting entries are made to reverse the cost already charged, even if the instruments that are the subject of the transaction are subsequently forfeited or, in the case of options, are not exercised. However, the entity may make a transfer between different components of equity. *[IFRS 2.23]*. For example, an entity's accounting policy might be to credit all amounts recorded for share-based transactions to a separate reserve such as 'Shares to be issued'. Where an award lapses after vesting, it would then be appropriate to transfer an amount equivalent to the cumulative cost for the lapsed award from 'Shares to be issued' to another component of equity.

This prohibition against 'truing up' (i.e. reversing the cost of vested awards that lapse) is controversial, since it has the effect that a cost is still recognised for options that are never exercised, typically because they are 'underwater' (i.e. the current share price is lower than the option exercise price), so that it is not in the holder's interest to exercise the option. Some commentators have observed that an accounting standard that can result in an accounting cost for non-dilutive options does not meet the needs of those shareholders whose concerns about dilution were the catalyst for the share-based payment project in the first place (see 1.1 above).

The IASB counters such objections by pointing out that the treatment in IFRS 2 is perfectly consistent with that for other 'contingent' equity instruments, such as warrants, that ultimately result in no share ownership. Where an entity issues warrants for valuable consideration such as cash and those warrants lapse unexercised, the entity recognises no gain under IFRS. *[IFRS 2.BC218-221]*.

6.2 Vesting conditions other than market conditions

6.2.1 Awards with service conditions

Most share-based payment transactions with employees are subject to explicit or implied service conditions. Examples 34.7 and 34.8 below illustrate the application of the allocation principles discussed in 6.1 above to awards subject only to service conditions. *[IFRS 2.IG11]*.

Example 34.7: Award with no change in the estimate of number of awards vesting

An entity grants 100 share options to each of its 500 employees. Vesting is conditional upon the employees working for the entity over the next three years. The entity estimates that the fair value of each share option is €15. The entity's best estimate at each reporting date is that 100 (i.e. 20%) of the original 500 employees will leave during the three year period and therefore forfeit their rights to the share options.

If everything turns out exactly as expected, the entity will recognise the following amounts during the vesting period for services received as consideration for the share options.

Year	Calculation of cumulative expense	Cumulative expense (€)	Expense for period‡ (€)
1	50,000 options × 80%* × €15 × 1/3†	200,000	200,000
2	50,000 options × 80% × €15 × 2/3	400,000	200,000
3	50,000 options × 80% × €15 × 3/3	600,000	200,000

* The entity expects 100 of its 500 employees to leave and therefore only 80% of the options to vest.

† The vesting period is 3 years, and 1 year of it has expired.

‡ In each case the expense for the period is the difference between the calculated cumulative expense at the beginning and end of the period.

Example 34.8: Award with re-estimation of number of awards vesting due to staff turnover

As in Example 34.7 above, an entity grants 100 share options to each of its 500 employees. Vesting is conditional upon the employee working for the entity over the next three years. The entity estimates that the fair value of each share option is €15.

In this case, however, 20 employees leave during the first year, and the entity's best estimate at the end of year 1 is that a total of 75 (15%) of the original 500 employees will have left before the end of the vesting period. During the second year, a further 22 employees leave, and the entity revises its estimate of total employee departures over the vesting period from 15% to 12% (i.e. 60 of the original 500 employees). During the third year, a further 15 employees leave. Hence, a total of 57 employees (20 + 22 + 15) forfeit their rights to the share options during the three year period, and a total of 44,300 share options (443 employees × 100 options per employee) finally vest.

The entity will recognise the following amounts during the vesting period for services received as consideration for the share options.

Year	Calculation of cumulative expense	Cumulative expense (€)	Expense for period (€)
1	50,000 options × 85% × €15 × 1/3	212,500	212,500
2	50,000 options × 88% × €15 × 2/3	440,000	227,500
3	44,300 options × €15 × 3/3	664,500	224,500

Note that in Example 34.8 above, the number of employees that leave during year 1 and year 2 is not directly relevant to the calculation of cumulative expense in those years, but would naturally be a factor taken into account by the entity in estimating the likely number of awards finally vesting.

6.2.2 Equity instruments vesting in instalments ('graded' vesting)

An entity may make share-based payments that vest in instalments (sometimes referred to as 'graded' vesting). For example, an entity might grant an employee 600 options, 100 of which vest if the employee remains in service for one year, a further 200 after two years and the final 300 after three years. In today's more mobile labour markets, such awards are often favoured over awards which vest only on an 'all or nothing' basis after an extended period.

IFRS 2 requires such an award to be treated as three separate awards, of 100, 200 and 300 options, on the grounds that the different vesting periods will mean that the three tranches of the award have different fair values. *[IFRS 2.IG11]*. This may well have the effect that compared to the expense for an award with a single 'cliff' vesting, the expense for an award vesting in instalments will be for a different amount in total and require accelerated recognition of the expense in earlier periods, as illustrated in Example 34.9 below.

Example 34.9: Award vesting in instalments ('graded' vesting)

An entity is considering the implementation of a scheme that awards 600 free shares to each of its employees, with no conditions other than continuous service. Two alternatives are being considered:

- All 600 shares vest in full only at the end of three years.
- 100 shares vest after one year, 200 shares after two years and 300 shares after three years. Any shares received at the end of years 1 and 2 would have vested unconditionally.

The fair value of a share delivered in one year's time is €3; in two years' time €2.80; and in three years' time €2.50.

For an employee that remains with the entity for the full three year period, the first alternative would be accounted for as follows:

Year	Calculation of cumulative expense	Cumulative expense (€)	Expense for period (€)
1	600 shares × €2.50 × 1/3	500	500
2	600 shares × €2.50 × 2/3	1,000	500
3	600 shares × €2.50 × 3/3	1,500	500

For the second alternative, the analysis is that the employee has simultaneously received an award of 100 shares vesting over one year, an award of 200 shares vesting over two years and an award of 300 shares vesting over 3 years. This would be accounted for as follows:

Year	Calculation of cumulative expense	Cumulative expense (€)	Expense for period (€)
1	[100 shares × €3.00] + [200 shares × €2.80 × 1/2] + [300 shares × €2.50 × 1/3]	830	830
2	[100 shares × €3.00] + [200 shares × €2.80 × 2/2] + [300 shares × €2.50 × 2/3]	1,360	530
3	[100 shares × €3.00] + [200 shares × €2.80 × 2/2] + [300 shares × €2.50 × 3/3]	1,610	250

At first sight, such an approach seems to be taking account of vesting conditions other than market conditions in determining the fair value of an award, contrary to the basic principle of paragraph 19 of IFRS 2 (see 6.1.1 above). However, it is not the vesting conditions that are being taken into account *per se*, but the fact that the varying vesting periods will give rise to different lives for the award (which are required to be taken into account – see 7.2 and 8 below).

Provided all conditions are clearly understood at the outset, the accounting treatment illustrated in Example 34.9 would apply even if the vesting of shares in each year also depended on a performance condition unique to that year (e.g. that profit in that year must reach a given minimum level), as opposed to a cumulative performance condition (e.g. that profit must have grown by a minimum amount by the end of year 1, 2 or 3). This is because all tranches of the arrangement have the same service commencement date and so for the awards that have a performance condition relating to year 2 or year 3 there is a service condition covering a longer period than the performance condition. In other words, an award that vests at the end of year 3 conditional on profitability in year 3 is also conditional on the employee providing service for three years from the date of grant in order to be eligible to receive the award. This is discussed further at 5.3.7 above.

A variant of Example 34.9, is one where a share-based payment transaction vests with employees in instalments and the service period is not at least as long as the duration of the non-market performance condition, for example, a flotation or sale condition. The flotation or sale condition will be treated as a non-vesting condition and be incorporated into the determination of fair value (see 3.2 above). In contrast, when the service condition is the same duration as the flotation and sale condition, that condition will be treated as non-market performance condition, see Example 34.66 at 15.4.3 below.

The accounting treatment illustrated in Example 34.9 is the only treatment for graded vesting permitted under IFRS 2 whether an arrangement just has a service condition or whether it has both service and performance conditions. This contrasts with US GAAP[21] which permits, for awards with graded vesting where vesting depends solely on a service condition, a policy choice between the approach illustrated above and a straight-line recognition method.

6.2.3 Transactions with variable vesting periods due to non-market performance vesting conditions

An award may be made with a vesting period of variable length. For example, an award might be contingent upon achievement of a particular performance target (such as achieving a given level of cumulative earnings) within a given period, but vesting immediately once the target has been reached. Alternatively, an award might be contingent on levels of earnings growth over a period, but with vesting occurring more quickly if growth is achieved more quickly. Also some plans provide for 're-testing', whereby an original target is set for achievement within a given vesting period, but if that target is not met, a new target and/or a different vesting period are substituted.

In such cases, the entity needs to estimate the length of the vesting period at grant date, based on the most likely outcome of the performance condition. Subsequently, it is necessary continuously to re-estimate not only the number of awards that will finally vest, but also the date of vesting, as shown by Example 34.10. *[IFRS 2.15(b), IG12].* This contrasts with the treatment of awards with market conditions and variable vesting periods, where the initial estimate of the vesting period may not be revised (see 6.3.4 below).

Example 34.10: Award with non-market vesting condition and variable vesting period

At the beginning of year 1, the entity grants 100 shares each to 500 employees, conditional upon the employees remaining in the entity's employment during the vesting period. The shares will vest:

- at the end of year 1 if the entity's earnings increase by more than 18%;
- at the end of year 2 if the entity's earnings increase by more than an average of 13% per year over the two year period; or
- at the end of year 3 if the entity's earnings increase by more than an average of 10% per year over the three year period.

The award is estimated to have a fair value of $30 per share at grant date. It is expected that no dividends will be paid during the whole three year period.

By the end of the first year, the entity's earnings have increased by 14%, and 30 employees have left. The entity expects that earnings will continue to increase at a similar rate in year 2, and therefore expects that the shares will vest at the end of year 2. The entity expects, on the basis of a weighted average probability, that a further 30 employees will leave during year 2, and therefore expects that an award of 100 shares each will vest for 440 (500 – 30 – 30) employees at the end of year 2.

By the end of the second year, the entity's earnings have increased by only 10% and therefore the shares do not vest at the end of that year. 28 employees have left during the year. The entity expects that a further 25 employees will leave during year 3, and that the entity's earnings will increase by at least 6%, thereby achieving the average growth of 10% per year necessary for an award after 3 years, so that an award of 100 shares each will vest for 417 (500 – 30 – 28 – 25) employees at the end of year 3.

By the end of the third year, a further 23 employees have left and the entity's earnings have increased by 8%, resulting in an average increase of 10.67% per year. Therefore, 419 (500 – 30 – 28 – 23) employees receive 100 shares at the end of year 3.

The entity will recognise the following amounts during the vesting period for services received as consideration for the shares:

Year	Calculation of cumulative expense	Cumulative expense ($)	Expense for period ($)
1	440 employees × 100 shares × $30 × 1/2*	660,000	660,000
2	417 employees × 100 shares × $30 × 2/3*	834,000	174,000
3	419 employees × 100 shares × $30	1,257,000	423,000

* The entity's best estimate at the end of year 1 is that it is one year through a two year vesting period and at the end of year 2 that it is two years through a three year vesting period.

It will be noted that in Example 34.10, which is based on IG Example 2 in the implementation guidance to IFRS 2, it is assumed that the entity will pay no dividends (to any shareholders) throughout the maximum possible three year vesting period. This has the effect that the fair value of the shares to be awarded is equivalent to their market value at the date of grant.

If dividends were expected to be paid during the vesting period, this would no longer be the case. Employees would be better off if they received shares after two years rather than three, since they would have a right to receive dividends from the end of year two. In practice, an entity is unlikely to suspend dividend payments in order to simplify the calculation of its share-based payment expense, and it is unfortunate that IG Example 2 is not more realistic. *[IFRS 2 IG Example 2]*.

One solution might be to use the approach in IG Example 4 in the implementation guidance to IFRS 2 (the substance of which is reproduced as Example 34.12 at **6.2.5** below). That Example deals with an award whose exercise price is either CHF12 or CHF16, dependent upon various performance conditions. Because vesting conditions other than market conditions must be ignored in determining the value of an award, the approach is in effect to treat the award as the simultaneous grant of two awards, whose value, in that case, varies by reference to the different exercise prices. *[IFRS 2 IG Example 4]*.

The same principle could be applied to an award of shares that vests at different times according to the performance conditions, by determining different fair values for the shares (in this case depending on whether they vest after one, two or three years). The cumulative charge during the vesting period would be based on a best estimate of which outcome will occur, and the final cumulative charge would be based on the grant date fair value of the actual outcome (which will require some acceleration of expense if the actual vesting period is shorter than the previously estimated vesting period).

Such an approach appears to be taking account of non-market vesting conditions in determining the fair value of an award, contrary to the basic principle of paragraph 19 of IFRS 2 (see 6.1.1 above). However, it is not the vesting conditions that are being taken into account *per se*, but the fact that the varying vesting periods will give rise to different lives for the award (which are required to be taken into account – see 7.2 and 8 below). That said, the impact of the time value of the different lives on the fair value of the award will, in many cases, be insignificant and it will therefore be a matter of judgement as to how precisely an entity switches from one fair value to another.

Economically speaking, the entity in Example 34.10 has made a single award, the true fair value of which must be a function of the weighted probabilities of the various outcomes occurring. However, under the accounting model for share-settled awards in IFRS 2, the probability of achieving non-market performance conditions is not taken into account in valuing an award. If this is required to be ignored, the only approach open is to proceed as in Example 34.10 above and treat the arrangement as if it consisted of the simultaneous grant of three awards.

Some might object that this methodology is not relevant to the award in Example 34.10 above, since it is an award of shares rather than, in the case of Example 34.12 (see 6.2.5 below), an award of options. However, an award of shares is no more than an award of options with an exercise price of zero. Moreover, the treatment outlined in the previous paragraph is broadly consistent with the rationale given by IFRS 2 for the treatment of an award vesting in instalments (see 6.2.2 above).

In Example 34.10 above, the vesting period, although not known, is at least one of a finite number of known possibilities. The vesting period for some awards, however, may be more open-ended, such as is frequently the case for an award that vests on a trade sale or flotation of the business. Such awards are discussed further at 15.4 below.

6.2.4 Transactions with variable number of equity instruments awarded depending on non-market performance vesting conditions

More common than awards with a variable vesting period are those where the number of equity instruments awarded varies, typically increasing to reflect the margin by which a particular minimum target is exceeded. In accounting for such awards, the entity must continuously revise its estimate of the number of shares to be awarded, as illustrated in Example 34.11 below (which is based on IG Example 3 in the implementation guidance to IFRS 2). *[IFRS 2 IG Example 3]*.

Example 34.11: Award with non-market performance vesting condition and variable number of equity instruments

At the beginning of year 1, an entity grants an option over a variable number of shares (see below), estimated to have a fair value at grant date of £20 per share under option, to each of its 100 employees working in the sales department. The share options will vest at the end of year 3, provided that the employees remain in the entity's employment, and provided that the volume of sales of a particular product increases by at least an average of 5% per year. If the volume of sales of the product increases by an average of between 5% and 10% per year, each employee will be entitled to exercise 100 share options. If the volume of sales increases by an average of between 10% and 15% each year, each employee will be entitled to exercise 200 share options. If the volume of sales increases by an average of 15% or more, each employee will be entitled to exercise 300 share options.

By the end of the first year, seven employees have left and the entity expects that a total of 20 employees will leave by the end of year 3. Product sales have increased by 12% and the entity expects this rate of increase to continue over the next two years, so that 80 employees will be entitled to exercise 200 options each.

By the end of the second year, a further five employees have left. The entity now expects only three more employees to leave during year 3, and therefore expects a total of 15 employees to have left during the three year period. Product sales have increased by 18%, resulting in an average of 15% over the two years to date. The entity now expects that sales will average 15% or more over the three year period, so that 85 employees will be entitled to exercise 300 options each.

By the end of year 3, a further seven employees have left. Hence, 19 employees have left during the three year period, and 81 employees remain. However, due to trading conditions significantly poorer than expected, sales have increased by a 3 year average of only 12%, so that the 81 remaining employees are entitled to exercise only 200 share options.

The entity will recognise the following amounts during the vesting period for services received as consideration for the options.

Year	Calculation of cumulative expense	Cumulative expense (£)	Expense for period (£)
1	80 employees × 200 options × £20 × 1/3	106,667	106,667
2	85 employees × 300 options × £20 × 2/3	340,000	233,333
3	81 employees × 200 options × £20	324,000	(16,000)

This Example reinforces the point that, under the methodology in IFRS 2, it is quite possible for an equity-settled transaction to give rise to a credit to profit or loss for a particular period during the period to vesting.

Other types of awards seen where variable number of equity instruments are awarded depending on non-market conditions include an employee receiving awards dependent on an individual's performance rating, the higher the rating the more equity-instruments are awarded (see 3.1.2 above). When the vesting of a share-based payment arrangement is based on an individual's performance rating, for there to be a grant date of such an award the framework for determining the outcome needs to be sufficiently clear and objective to allow both the entity and the employee to make an estimate of the outcome of the award during the vesting period (see 5.3.3 above). Consistent with Example 34.11 above, the entity must continuously revise its estimate of the number of shares to be awarded, provided a grant date has been established for the award. However, if the framework for determining the performance rating outcome is not sufficiently clear and objective, the grant date may not occur until a later date, but the entity would need to consider if services are effectively being rendered for an award from a date earlier than the grant date as defined in IFRS 2 and the cost of the award recognised over a period starting with that earlier date (see 5.3.2 above).

6.2.5 Transactions with variable exercise price due to non-market performance vesting conditions

Another mechanism for delivering higher value to the recipient of a share award so as to reflect the margin by which a particular target is exceeded might be to vary the exercise price depending on performance. IFRS 2 requires such an award to be dealt with, in effect, as more than one award. The fair value of each award is determined, and the cost during the vesting period based on the best estimate of which award will actually vest, with the final cumulative charge being based on the actual outcome. *[IFRS 2.IG12, IG Example 4]*.

This is illustrated in Example 34.12 below.

Example 34.12: Award with non-market performance vesting condition and variable exercise price

An entity grants to a senior executive 10,000 share options, conditional upon the executive's remaining in the entity's employment for three years. The exercise price is CHF40. However, the exercise price drops to CHF30 if the entity's earnings increase by at least an average of 10% per year over the three year period.

On grant date, the entity estimates that the fair value of the share options, with an exercise price of CHF30, is CHF16 per option. If the exercise price is CHF40, the entity estimates that the share options have a fair value of CHF12 per option. During year 1, the entity's earnings increased by 12%, and the entity expects that earnings will continue to increase at this rate over the next two years. The entity therefore expects that the earnings target will be achieved, and hence the share options will have an exercise price of CHF30.

During year 2, the entity's earnings increased by 13%, and the entity continues to expect that the earnings target will be achieved. During year 3, the entity's earnings increased by only 3%, and therefore the earnings target was not achieved. The executive completes three years' service, and therefore satisfies the service condition. Because the earnings target was not achieved, the 10,000 vested share options have an exercise price of CHF40.

The entity will recognise the following amounts during the vesting period for services received as consideration for the options.

Year	Calculation of cumulative expense	Cumulative expense (CHF)	Expense for period (CHF)
1	10,000 options × CHF16 × 1/3	53,333	53,333
2	10,000 options × CHF16 × 2/3	106,667	53,334
3	10,000 options × CHF12	120,000	13,333

At first sight this may seem a rather surprising approach. In reality, is it not the case that the entity in Example 34.12 has made a single award, the fair value of which must lie between CHF12 and CHF16, as a function of the weighted probabilities of either outcome occurring? Economically speaking, this is indeed the case. However, under the accounting model for equity-settled share-based payments in IFRS 2, the probability of achieving non-market performance conditions is not taken into account in valuing an award. If this is required to be ignored, the only approach open is to proceed as above.

6.3 Market conditions

6.3.1 What is a 'market condition'?

IFRS 2 defines a market condition as follows:

'A performance condition upon which the exercise price, vesting or exercisability of an equity instrument depends that is related to the market price (or value) of the entity's equity instruments (or the equity instruments of another entity in the same group), such as:

(a) attaining a specified share price or a specified amount of intrinsic value of a share option; or

(b) achieving a specified target that is based on the market price (or value) of the entity's equity instruments (or the equity instruments of another entity in the same group) relative to an index of market prices of equity instruments of other entities.

A market condition requires the counterparty to complete a specified period of service (i.e. a service condition); the service requirement can be explicit or implicit.' *[IFRS 2 Appendix A]*.

A market condition is a type of performance condition and the above definition should be read together with the definition of a performance condition (see 3.1 above). If there is no service requirement, the condition will be a non-vesting condition rather than a performance vesting condition (see 3.2 above).

The 'intrinsic value' of a share option means 'the difference between the fair value of the shares to which the counterparty has the (conditional or unconditional) right to subscribe or which it has the right to receive, and the price (if any) the counterparty is (or will be) required to pay for those shares'. *[IFRS 2 Appendix A]*. In other words, an option to pay $8 for a share with a fair value of $10 has an intrinsic value of $2. A performance condition based on the share price and one based on the intrinsic value of the option are effectively the same, since the values of each will obviously move in parallel.

An example of a market condition is a condition based on total shareholder return (TSR). TSR is a measure of the increase or decrease in a given sum invested in an entity over a period on the assumption that all dividends received in the period had been used to purchase further shares in the entity. The market price of the entity's shares is an input to the calculation.

However, a condition linked to a purely internal financial performance measure such as profit or earnings per share is not a market condition. Such measures will affect the share price, but are not directly linked to it, and hence are not market conditions.

A condition linked to a general market index is a non-vesting condition rather than a market condition (see 3.2 above and 6.4 below). For example, suppose that an entity engaged in investment management and listed only in London grants options to an employee responsible for the Far East equities portfolio. The options have a condition linked to movements in a general index of shares of entities listed in Hong Kong, so as to compare the performance of the portfolio of investments for which the employee is responsible with that of the overall market in which they are traded. That condition would not be regarded as a market condition under IFRS 2, because even though it relates to the performance of a market, the reporting entity's own share price is not relevant to the satisfaction of the condition.

However, if the condition were that the entity's own share price had to outperform a general index of shares of entities listed in Hong Kong, that condition would be a market condition because the reporting entity's own share price is then relevant to the satisfaction of the condition.

6.3.2 Summary of accounting treatment

The key feature of the accounting treatment of an equity-settled transaction subject to a market condition is that the market condition is taken into account in valuing the award at the date of grant, but then subsequently ignored, so that an award is treated as vesting irrespective of whether the market condition is satisfied, provided that all service and non-market performance vesting conditions are satisfied. *[IFRS 2.21, IG13]*. This can have rather controversial consequences, as illustrated by Example 34.13.

Example 34.13: Award with market condition

An entity grants an employee an option to buy a share on condition of remaining in employment for three years and the share price at the end of that period being at least €7. At the end of the vesting period, the share price is €6.80. The share price condition is factored into the initial valuation of the option, and the option is considered to vest provided that the employee remains for three years, irrespective of whether the share price does in fact reach €7.

Therefore, IFRS 2 sometimes treats as vesting (and recognises a cost for) awards that do not actually vest in the natural sense of the word. See also Example 34.15 at 6.3.4 below.

This treatment is clearly significantly different from that for transactions involving a non-market vesting condition, where no cost would be recognised where the conditions were not met. The Basis for Conclusions indicates that the IASB accepted this difference for two main reasons:

(a) it was consistent with the approach in the US standard FAS 123 – *Accounting for Stock-Based Compensation*; and

(b) in principle, the same approach should have been adopted for all performance conditions. However, whereas market conditions can be readily incorporated into the valuation of options, other conditions cannot. *[IFRS 2.BC183-184]*.

The methodology prescribed by IFRS 2 for transactions with a vesting condition other than a market condition is therefore to determine the fair value of the option ignoring the condition and then to multiply that fair value by the estimated (and ultimately the actual) number of awards expected to vest based on the likelihood of that non-market vesting condition being met (see 6.2 above). It is interesting to note, however, that the January 2008 amendment to IFRS 2 (see 1.2 above) had the effect that certain conditions previously regarded as non-market vesting conditions (and therefore 'impossible' to incorporate in the determination of fair value) became non-vesting conditions (and therefore required to be incorporated in the determination of fair value).

One of the reasons for adoption of this approach under US GAAP (not referred to in the Basis for Conclusions in IFRS 2) was as an 'anti-avoidance' measure. The concern was that the introduction of certain market conditions could effectively allow for the reversal of the expense for 'underwater' options (i.e. those whose exercise price is higher than the share price such that it is not in the holder's interest to exercise the option) for which all significant vesting conditions had been satisfied, contrary to the general principle in US GAAP (and IFRS 2) that no revisions should be made to the expense for an already vested option.

For example, when the share price is £10 an entity could grant an employee an option, exercisable at £10, provided that a certain sales target had been met within one year. If the target were achieved, IFRS 2 would require an expense to be recognised even if the share price at the end of the year were only £8, so that the employee would not rationally exercise the option. If, however, the performance conditions were that (a) the sales target was achieved and (b) the share price was at least £10.01, the effect would be (absent specific provision for market conditions) that the entity could reverse any expense for 'underwater' options.

It appears that it may be possible to soften the impact of IFRS 2's rules for market conditions relatively easily by introducing a non-market vesting condition closely correlated to the market condition. For instance, the option in Example 34.13 above could be modified so that exercise was dependent not only upon the €7 target share price and continuous employment, but also on a target growth in earnings per share. Whilst there would not be a perfect correlation between earnings per share and the share price, it would be expected that they would move roughly in parallel, particularly if the entity has historically had a fairly consistent price/earnings ratio. Thus, if the share price target were not met, it would be highly likely that the earnings per share target would not be met either. This would allow the entity to show no cumulative cost for the option, since only one (i.e. not all) of the non-market related vesting conditions would have been met.

Similarly, entities in sectors where the share price is closely related to net asset value (e.g. property companies and investment trusts) could incorporate a net asset value target as a non-market performance condition that would be highly likely to be satisfied only if the market condition was satisfied.

The matrices below illustrate the interaction of market conditions and vesting conditions other than market conditions. Matrix 1 summarises the possible outcomes for an award with the following two vesting conditions:

- the employee remaining in service for three years ('service condition'); and
- the entity's total shareholder return ('TSR') relative to that of a peer group being in the top 10% of its peer group at the end of the period ('TSR target (market condition)').

Matrix 1

	Service condition met?	**TSR target (market condition) met?**	**IFRS 2 expense?**
1	Yes	Yes	Yes
2	Yes	No	Yes
3	No	Yes	No
4	No	No	No

It will be seen that, to all intents and purposes, the 'TSR target (market condition) met?' column is redundant, as this market condition is not relevant to whether or not the award is treated as vesting by IFRS 2. The effect of this is that the entity would recognise an expense for outcome 2, even though no awards truly vest.

Matrix 2 summarises the possible outcomes for an award with the same conditions as in Matrix 1, plus a requirement for earnings per share to grow by a general inflation index plus 10% over the period ('EPS target').

Matrix 2

	Service condition met?	**TSR target (market condition) met?**	**EPS target (non-market condition) met?**	**IFRS 2 expense?**
1	Yes	Yes	Yes	Yes
2	Yes	No	Yes	Yes
3	Yes	Yes	No	No
4	Yes	No	No	No
5	No	Yes	Yes	No
6	No	No	Yes	No
7	No	Yes	No	No
8	No	No	No	No

Again it will be seen that, to all intents and purposes, the 'TSR target (market condition) met?' column is redundant, as this market condition is not relevant to whether or not the award is treated as vesting by IFRS 2. The effect of this is that the entity would recognise an expense for outcome 2, even though no awards truly vest. However, no expense would be recognised for outcome 4, which is, except for the introduction of the EPS target, equivalent to outcome 2 in Matrix 1, for which an expense is recognised. This illustrates that the introduction of a non-market vesting condition closely related to a market condition may mitigate the impact of IFRS 2.

Examples of the application of the accounting treatment for transactions involving market conditions are given in **6.3.3** to **6.3.5** below.

6.3.3 Transactions with market conditions and known vesting periods

The accounting for such transactions is essentially the same as that for transactions without market conditions but with a known vesting period (including 'graded' vesting – see **6.2.2** above), except that adjustments are made to reflect the changing probability of the achievement of the non-market vesting conditions only, as illustrated by Example 34.14 below. *[IFRS 2.19-21, IG13, IG Example 5].*

Example 34.14: Award with market condition and fixed vesting period

At the beginning of year 1, an entity grants to 100 employees 1,000 share options each, conditional upon the employees remaining in the entity's employment until the end of year 3. However, the share options cannot be exercised unless the share price has increased from €50 at the beginning of year 1 to more than €65 at the end of year 3.

If the share price is above €65 at the end of year 3, the share options can be exercised at any time during the next seven years, i.e. by the end of year 10. The entity applies a binomial option pricing model (see 8 below), which takes into account the possibility that the share price will exceed €65 at the end of year 3 (and hence the share options vest and become exercisable) and the possibility that the share price will not exceed €65 at the end of year 3 (and hence the options will be treated as having vested under IFRS 2 but will never be exercisable – as explained below). It estimates the fair value of the share options with this market condition to be €24 per option.

IFRS 2 requires the entity to recognise the services received from a counterparty who satisfies all other vesting conditions (e.g. services received from an employee who remains in service for the specified service period), irrespective of whether that market condition is satisfied. It makes no difference whether the share price target is achieved, since the possibility that the share price target might not be achieved has already been taken into account when estimating the fair value of the share options at grant date. However, the options are subject to another condition (i.e. continuous employment) and the cost recognised should be adjusted to reflect the ongoing best estimate of employee retention.

By the end of the first year, seven employees have left and the entity expects that a total of 20 employees will leave by the end of year 3, so that 80 employees will have satisfied all conditions other than the market condition (i.e. continuous employment).

By the end of the second year, a further five employees have left. The entity now expects only three more employees will leave during year 3, and therefore expects that a total of 15 employees will have left during the three year period, so that 85 employees will have satisfied all conditions other than the market condition.

By the end of year 3, a further seven employees have left. Hence, 19 employees have left during the three year period, and 81 employees remain. However, the share price is only €60, so that the options cannot be exercised. Nevertheless, as all conditions other than the market condition have been satisfied, a cumulative cost is recorded as if the options had fully vested in 81 employees.

The entity will recognise the following amounts during the vesting period for services received as consideration for the options (which in economic reality do not vest).

Year	Calculation of cumulative expense	Cumulative expense (€)	Expense for period (€)
1	80 employees × 1,000 options × €24 × 1/3	640,000	640,000
2	85 employees × 1,000 options × €24 × 2/3	1,360,000	720,000
3	81 employees × 1,000 options × €24	1,944,000	584,000

6.3.4 Transactions with variable vesting periods due to market conditions

Where a transaction has a variable vesting period due to a market condition, a best estimate of the most likely vesting period will have been used in determining the fair value of the transaction at the date of grant. IFRS 2 requires the expense for that transaction to be recognised over an estimated expected vesting period consistent with the assumptions used in the valuation, without any subsequent revision. *[IFRS 2.15(b), IG14]*.

This may mean, for example, that, if the actual vesting period for an employee share option award turns out to be longer than that anticipated for the purposes of the initial valuation, a cost is nevertheless recorded in respect of all employees who reach the end of the anticipated vesting period, even if they do not reach the end of the actual vesting period, as shown by Example 34.15 below, which is based on IG Example 6 in the implementation guidance in IFRS 2. *[IFRS 2 IG Example 6]*.

Example 34.15: Award with market condition and variable vesting period

At the beginning of year 1, an entity grants 10,000 share options with a ten year life to each of ten senior executives. The share options will vest and become exercisable immediately if and when the entity's share price increases from £50 to £70, provided that the executive remains in service until the share price target is achieved.

The entity applies a binomial option pricing model, which takes into account the possibility that the share price target will be achieved during the ten year life of the options, and the possibility that the target will not be achieved. The entity estimates that the fair value of the share options at grant date is £25 per option. From the option pricing model, the entity determines that the most likely vesting period is five years. The entity also estimates that two executives will have left by the end of year 5, and therefore expects that 80,000 share options (10,000 share options × 8 executives) will vest at the end of year 5.

Throughout years 1 to 4, the entity continues to estimate that a total of two executives will leave by the end of year 5. However, in total three executives leave, one in each of years 3, 4 and 5. The share price target is achieved at the end of year 6. Another executive leaves during year 6, before the share price target is achieved.

Paragraph 15 of IFRS 2 requires the entity to recognise the services received over the expected vesting period, as estimated at grant date, and also requires the entity not to revise that estimate. Therefore, the entity recognises the services received from the executives over years 1-5. Hence, the transaction amount is ultimately based on 70,000 share options (10,000 share options × 7 executives who remain in service at the end of year 5). Although another executive left during year 6, no adjustment is made, because the executive had already completed the expected vesting period of 5 years.

The entity will recognise the following amounts during the initial expected five year vesting period for services received as consideration for the options.

Year	Calculation of cumulative expense	Cumulative expense (£)	Expense for period (£)
1	8 employees × 10,000 options × £25 × 1/5	400,000	400,000
2	8 employees × 10,000 options × £25 × 2/5	800,000	400,000
3	8 employees × 10,000 options × £25 × 3/5	1,200,000	400,000
4	8 employees × 10,000 options × £25 × 4/5	1,600,000	400,000
5	7 employees × 10,000 options × £25	1,750,000	150,000

IFRS 2 does not specifically address the converse situation, namely where the award actually vests before the end of the anticipated vesting period. In our view, where this occurs, any expense not yet recognised at the point of vesting should be immediately accelerated. We consider that this treatment is most consistent with the overall requirement of IFRS 2 to recognise an expense for share-based payment transactions 'as the services are received'. *[IFRS 2.7]*. It is difficult to regard any services being received for an award after it has vested.

Moreover, the prohibition in IFRS 2 on adjusting the vesting period as originally determined refers to 'the estimate of the expected vesting period'. In our view, the acceleration of vesting that we propose is not the revision of an estimated period, but the substitution of a known vesting period for an estimate.

Suppose in Example 34.15 above, the award had in fact vested at the end of year 4. We believe that the expense for such an award should be allocated as follows:

Year	Calculation of cumulative expense	Cumulative expense (£)	Expense for period (£)
1	8 employees × 10,000 options × £25 × 1/5	400,000	400,000
2	8 employees × 10,000 options × £25 × 2/5	800,000	400,000
3	8 employees × 10,000 options × £25 × 3/5	1,200,000	400,000
4	8 employees × 10,000 options × £25 × 4/4	2,000,000	800,000

6.3.5 Transactions with multiple outcomes depending on market conditions

In practice, it is very common for an award subject to market conditions to give varying levels of reward that increase depending on the extent to which a 'base line' market performance target has been met. Such an award is illustrated in Example 34.16 below.

Example 34.16: Award with market conditions and multiple outcomes

At the beginning of year 1, the reporting entity grants an employee an award of shares that will vest on the third anniversary of grant if the employee is still in employment. The number of shares depends on the share price achieved at the end of the three-year period. The employee will receive:

- no shares if the share price is below €10.00
- 100 shares if the share price is in the range €10.00-€14.99
- 150 shares if the share price is in the range €15.00-€19.99
- 180 shares if the share price is €20.00 or above.

In effect the entity has made three awards, which need to be valued as follows:

(a) 100 shares if the employee remains in service for three years and the share price is in the range €10.00-€14.99

(b) 50 (150 – 100) shares if the employee remains in service for three years and the share price is in the range €15.00-€19.99; and

(c) 30 (180 – 150) shares if the employee remains in service for three years and the share price is €20.00 or more.

Each award would be valued, ignoring the impact of the three-year service condition but taking account of the share price target. This would result in each tranche of the award being subject to an increasing level of discount to reflect the relative probability of the share price target for each tranche of the award being met. All three awards would then be expensed over the three-year service period, and forfeited only if the awards lapsed as a result of the employee leaving during that period.

It can be seen that the (perhaps somewhat counterintuitive) impact of this is that an equity-settled share-based payment where the number of shares increases in line with increases in the entity's share price may nevertheless have a fixed grant date value irrespective of the number of shares finally awarded.

6.3.6 *Transactions with independent market conditions, non-market vesting conditions or non-vesting conditions*

6.3.6.A *Independent market and non-market vesting conditions*

The discussion at 6.3.2 above addressed the accounting treatment of awards with multiple conditions that must all be satisfied, i.e. a market condition and a non-market vesting condition. However, entities might also make awards with multiple conditions, only one of which need be satisfied, i.e. the awards vest on satisfaction of either a market condition *or* a non-market vesting condition. IFRS 2 provides no explicit guidance on the treatment of such awards, which is far from clear, as illustrated by Example 34.17 below.

Example 34.17: Award with independent market conditions and non-market vesting conditions

An entity grants an employee 100 share options that vest after three years if the employee is still in employment and the entity achieves either:

- cumulative total shareholder return (TSR) over three years of at least 15%; or
- cumulative profits over three years of at least £200 million.

The fair value of the award, ignoring vesting conditions, is £300,000. The fair value of the award, taking account of the TSR condition, but not the other conditions, is £210,000.

In our view, the entity has, in effect, simultaneously issued two awards – call them 'A' and 'B' – which vest as follows:

A on achievement of three years' service plus minimum TSR; and

B on achievement of three years' service plus minimum earnings growth.

If the conditions for both awards are simultaneously satisfied, one or other effectively lapses.

It is clear that award A, if issued separately, would require the entity to recognise an expense of £210,000 if the employee were still in service at the end of the three year period. It therefore seems clear that, if the employee does remain in service, there should be a charge of £210,000 irrespective of whether the award actually vests. It would be anomalous for the entity to avoid recording a charge that would have been recognised if the entity had made award A in isolation simply by packaging it with award B.

If in fact the award vested because the earnings condition, but not the market condition, had been satisfied, it would then be appropriate to recognise a total expense of £300,000.

During the vesting period, we believe that the entity should make an assessment at each reporting date of the basis on which the award is expected to vest. It should assess whether, as at that date, the award is expected to vest by virtue of the earnings condition, but not the TSR condition, being satisfied. Assume (for example) that the entity assesses at the end of year 1 that the award is likely to vest by virtue of the TSR condition, and at the end of year 2 that it is likely to vest by virtue of the earnings condition, and that the award actually does not vest, but the employee remains in service. This would give rise to annual expense as follows:

Year	Calculation of cumulative expense	Cumulative expense (£)	Expense for period (£)
1	210,000 × 1/3	70,000	70,000
2	300,000 × 2/3	200,000	130,000
3	210,000 × 3/3	210,000	10,000

We believe that ongoing reassessment during the vesting period is most consistent with the general approach of IFRS 2 to awards with a number of possible outcomes (see 10 below).

Of course, as for other awards, the accounting treatment would also require an assessment of whether or not the employee was actually going to remain in service.

A further question that arises is how the award should be accounted for if both conditions are satisfied. It would clearly be inappropriate to recognise an expense of £510,000 (the sum of the separate fair values of the award) – this would be double-counting, because the employee receives only one package of 100 options. However, should the total expense be taken as £210,000 or £300,000? In our view, it is appropriate to recognise a cost of £300,000 since the non-market vesting condition has been satisfied.

Ultimately, this is an issue which only the IASB can solve, since it arises from the inconsistent treatment by IFRS 2 of awards with market conditions and those with non-market conditions. As noted at 3.4 above, the IASB has concluded not to perform further research into IFRS 2.[22] Therefore we continue to believe that ongoing reassessment during the vesting period is most consistent with the general approach of IFRS 2 for awards with multiple possible outcomes.

6.3.6.B Independent market conditions and non-vesting conditions

Arrangements are also seen where a share-based payment transaction vests on the satisfaction of either a market condition or a non-vesting condition.

In our view, an entity granting an award on the basis of a service condition (and any other non-market vesting conditions) plus either a market condition or a non-vesting condition should measure the fair value of the award at grant date taking into account the probability that either the market condition or the non-vesting condition will be met. The fact that there are two alternative conditions on which the award might vest means that, unless the two conditions are perfectly correlated, the grant date fair value of such an award will be higher than that of an award where there is only one possible basis on which the award might vest. Irrespective of whether the market condition and/or the non-vesting conditions are met, the entity will recognise the grant date fair value provided all other service and non-market vesting conditions are met (i.e. the expense recognition is consistent with that of any award with market and/or non-vesting conditions).

6.3.7 Transactions with hybrid or interdependent market conditions and non-market vesting conditions

Awards may sometimes have a performance condition which depends simultaneously on a market element and a non-market element, sometimes known as ‘hybrid’ conditions. Examples of such conditions include:

- a particular price-earnings (PE) ratio (calculated by reference to share price, a market condition, and earnings, a non-market vesting condition); and
- a maximum level of discount of market capitalisation (a market condition) below net asset value (a non-market vesting condition).

Such awards are rather curious, in the sense that these ratios may remain fairly constant irrespective of the underlying performance of the entity, so that a performance condition based on them is arguably of limited motivational value.

In our view, in contrast to our suggested treatment of awards with independent market and non-market vesting conditions discussed at 6.3.6.A above, awards with interdependent market and non-market vesting conditions must be accounted for entirely as awards with market conditions. These awards contain at least one element that meets the definition of a market condition but which cannot be completely split from the non-market element for separate assessment. An indicator such as the PE ratio, or discount of market capitalisation below net asset value, is a market condition as defined since it is 'related to the market price ... of the entity's equity instruments' (see 6.3.1 above).

6.3.8 Awards with a condition linked to flotation price

Awards in an unlisted entity may be granted with a condition linked to the achievement of a specific price when the entity floats. On flotation there is a market and a market price for the entity's equity instruments and the achievement of a specific price on flotation would, in our view, be a market condition when accompanied by a corresponding service requirement (see 15.4 below).

6.4 Non-vesting conditions

The accounting treatment for awards with non-vesting conditions has some similarities to that for awards with market conditions in that:

- the fair value of the award at grant date is reduced to reflect the impact of the condition; and
- an expense is recognised for the award irrespective of whether the non-vesting condition is met, provided that all vesting conditions (other than market conditions) are met. *[IFRS 2.21A]*.

However, in some situations the accounting for non-vesting conditions differs from that for market conditions as regards the timing of the recognition of expense if the non-vesting condition is not satisfied (see 6.4.3 below).

6.4.1 Awards with no conditions other than non-vesting conditions

The effect of the treatment required by IFRS 2 is that any award that has only non-vesting conditions (e.g. an option award to an employee that may be exercised on a trade sale or IPO of the entity, irrespective of whether the employee is still in employment at that time) must be expensed in full at grant date. This is discussed further at 3.2 above and at 15.4 below, and illustrated in Example 34.5 at 6.1 above.

6.4.2 Awards with non-vesting conditions and variable vesting periods

IFRS 2 does not explicitly address the determination of the vesting period for an award with a non-vesting condition but a variable vesting period (e.g. an award which delivers 100 shares when the price of gold reaches a given level, but without limit as to when that level must be achieved, so long as the employee is still in employment when the target is reached). However, given the close similarity between the required treatment for awards with non-vesting conditions and that for awards with market conditions, we believe that entities should follow the guidance in the standard for awards with market conditions and variable vesting periods (see 6.3.4 above).

6.4.3 Failure to meet non-vesting conditions

As noted above, the accounting for non-vesting conditions sometimes differs from that for market conditions as regards the timing of the recognition of expense if the non-vesting condition is not satisfied. The treatment depends on the nature of the non-vesting condition, as follows:

- if a non-vesting condition within the control of the counterparty (e.g. making monthly savings in an SAYE scheme or holding a specified number of shares in a matching share arrangement) is not satisfied during the vesting period, the failure to satisfy the condition is treated as a cancellation (see 7.4 below), with immediate recognition of any expense for the award not previously recognised; *[IFRS 2.28A, IG24, IG Example 9A]*
- if a non-vesting condition within the control of the entity (e.g. continuing to operate the scheme) is not satisfied during the vesting period, the failure to satisfy the condition is treated as a cancellation (see 7.4 below), with immediate recognition of any expense for the award not previously recognised; *[IFRS 2.28A, IG24]* but
- if a non-vesting condition within the control of neither the counterparty nor the entity (e.g. a financial market index reaching a minimum level) is not satisfied, there is no change to the accounting and the expense continues to be recognised over the vesting period, unless the award is otherwise treated as forfeited by IFRS 2. *[IFRS 2.BC237A, IG24]*. In our view, the reference to the vesting period would include any deemed vesting period calculated as described in 6.4.2 above.

If an award is forfeited due to a failure to satisfy a non-vesting condition after the end of the vesting period (e.g. a requirement for an employee not to work for a competitor for a two year period after vesting), no adjustment is made to the expense previously recognised, consistent with the general provisions of IFRS 2 for accounting for awards in the post-vesting period (see 6.1.3 above). This would be the case even if shares previously issued to the employee were required to be returned to the entity on forfeiture (see 3.1.1 and 3.2.3 above for further discussion of clawback arrangements and non-compete arrangements respectively).

7 EQUITY-SETTLED TRANSACTIONS – MODIFICATION, CANCELLATION AND SETTLEMENT

7.1 Background

It is quite common for equity instruments to be modified or cancelled before or after vesting. Typically this is done where the conditions for an award have become so onerous as to be virtually unachievable, or (in the case of an option) where the share price has fallen so far below the exercise price of an option that it is unlikely that the option will ever be 'in the money' to the holder during its life. In such cases, an entity may take the view that the equity awards are so unattainable as to have little or no motivational effect, and accordingly replace them with less onerous alternatives. Conversely, and more rarely, an entity may make the terms of a share award more onerous (possibly because of shareholder concern that targets are insufficiently demanding). In addition an entity may 'settle' an award, i.e. cancel it in return for cash or other consideration.

A target entity might modify existing share-based payment arrangements in the period leading up to a business combination. In this situation, it needs to be determined whether the guidance in IFRS 2 is applicable or whether the modification is being made for the benefit of the acquirer or the combined entity, in which case the guidance in IFRS 3 is likely to apply (see 11.2 below).

IFRS 2 contains detailed provisions for modification, cancellation and settlement. Whilst these provisions (like the summary of them below) are framed in terms of share-based payment transactions with employees, they apply to transactions with parties other than employees that are measured by reference to the fair value of the equity instruments granted (see 5.4 above). In that case, however, all references to 'grant date' should be taken as references to the date on which the third party supplied goods or rendered service. *[IFRS 2.26]*.

In the discussion below, any reference to a 'cancellation' is to any cancellation, whether instigated by the entity or the counterparty. As well as more obvious situations where an award is cancelled by either the entity or the counterparty, cancellations include:

- a failure by the entity to satisfy a non-vesting condition (see 6.4.3 above) within the control of the entity; and
- a failure by the counterparty to satisfy a non-vesting condition (see 6.4.3 above) within the control of the counterparty. *[IFRS 2.28A, IG24]*.

The discussion below is not relevant to cancellations and modifications of those equity-settled transactions that are (exceptionally) accounted for at intrinsic value (see 8.8 below).

The basic principles of the rules for modification, cancellation and settlement, which are discussed in more detail at 7.3 and 7.4 below, can be summarised as follows.

- As a minimum, the entity must recognise the amount that would have been recognised for the award if it remained in place on its original terms. *[IFRS 2.27]*.
- If the value of an award to an employee is reduced (e.g. by reducing the number of equity instruments subject to the award or, in the case of an option, by increasing the exercise price), there is no reduction in the cost recognised in profit or loss. *[IFRS 2.27, B42, B44]*.
- However, where the effect of the modification, cancellation or settlement is to increase the value of the award to an employee (e.g. by increasing the number of equity instruments subject to the award or, in the case of an option, by reducing the exercise price), the incremental fair value must be recognised as a cost. The incremental fair value is the difference between the fair value of the original award and that of the modified award, both measured at the date of modification. *[IFRS 2.27, B43]*.

It might be thought that, when an award has been modified, and certainly when it has been cancelled altogether, it no longer exists, and that it is therefore not appropriate to recognise any cost for it. However, such a view would be consistent with a vesting date measurement model rather than with the grant/service date measurement model of IFRS 2. Under the IFRS 2 model, the value of an award at grant date or service date cannot be changed by subsequent events.

Another reason given for the approach in IFRS 2 is that if entities were able not to recognise the cost of modified or cancelled options they would in effect be able to apply a selective form of 'truing up', whereby options that increased in value after grant would remain 'frozen' at their grant date valuation under the general principles of IFRS 2, whilst options that decreased in value could be modified or cancelled after grant date and credit taken for the fall in value. *[IFRS 2.BC222-237]*.

7.2 Valuation requirements when an award is modified, cancelled or settled

These provisions have the important practical consequence that, when an award is modified, cancelled or settled, the entity must obtain a fair value not only for the modified award, but also for the original award, updated to the date of modification. If the award had not been modified, there would have been no need to obtain a valuation for the original award after the date of grant.

Any modification of a performance condition clearly has an impact on the 'real' value of an award but it may have no direct effect on the value of the award for the purposes of IFRS 2. As discussed at 6.2 to 6.4 above, this is because market vesting conditions and non-vesting conditions are taken into account in valuing an award whereas non-market vesting conditions are not. Accordingly, by implication, a change to a non-market performance condition will not necessarily affect the expense recognised for the award under IFRS 2.

For example, if an award is contingent upon sales of a given number of units and the number of units required to be sold is decreased, the 'real' value of the award is clearly increased. However, as the performance condition is a non-market condition, and therefore not relevant to the original determination of the value of the award, there is no incremental fair value required to be accounted for by IFRS 2. If the change in the condition results in an increase in the estimated number of awards expected to vest, the change of estimate will however give rise to an accounting charge (see 6.1 to 6.4 above).

If an award is modified by changing the service period, the situation is more complex. A service condition does not of itself change the fair value of the award for the purposes of IFRS 2, but a change in service period may indirectly change the life of the award, which is relevant to its value (see 8 below). Similar considerations apply where performance conditions are modified in such a way as to alter the anticipated vesting date.

The valuation requirements relating to cancelled and settled awards are considered further at 7.4 below.

7.3 Modification

When an award is modified, the entity must as a minimum recognise the cost of the original award as if it had not been modified (i.e. at the original grant date fair value, spread over the original vesting period, and subject to the original vesting conditions). This applies unless the award does not vest because of failure to satisfy a vesting condition (other than a market condition) that was specified at grant date. *[IFRS 2.27, B42].*

In addition, a further cost must be recognised for any modifications that increase the fair value of the award. This additional cost is spread over the period from the date of modification until the vesting date of the modified award, which might not be the same as that of the original award. Where a modification is made after the original vesting period has expired, and is subject to no further vesting conditions, any incremental fair value should be recognised immediately. *[IFRS 2.27, B42-43].*

Whether a modification increases or decreases the fair value of an award is determined as at the date of modification, as illustrated by Example 34.18. *[IFRS 2.27, B42-44].*

Example 34.18: Does a modification increase or decrease the value of an award?

At the beginning of year 1, an entity granted two executives, A and B, a number of options worth $100 each.

At the beginning of year 2, A's options are modified such that they have a fair value of $85, their current fair value being $80. This is treated as an increase in fair value of $5 (even though the modified award is worth less than the original award when first granted). Therefore an additional $5 of expense would be recognised in respect of A's options.

At the beginning of year 3, B's options are modified such that they have a fair value of $120, their current fair value being $125. This is treated as a reduction in fair value of $5 (even though the modified award is worth more than the original award when first granted). However, there is no change to the expense recognised for B's options as IFRS 2 requires the entity to recognise, as a minimum, the original grant date fair value of the options (i.e. $100).

This treatment ensures that movements in the fair value of the original award are not reflected in the entity's profit or loss, consistent with the treatment of other equity instruments under IFRS.

IFRS 2 provides further detailed guidance on this requirement as discussed below.

7.3.1 Modifications that increase the value of an award

7.3.1.A Increase in fair value of equity instruments granted

If the modification increases the fair value of the equity instruments granted, (e.g. by reducing the exercise price or changing the exercise period), the incremental fair value, measured at the date of modification, must be recognised over the period from the date of modification to the date of vesting for the modified instruments, as illustrated in Example 34.19 below. *[IFRS 2.B43(a), IG15, IG Example 7].*

Example 34.19: Award modified by repricing

At the beginning of year 1, an entity grants 100 share options to each of its 500 employees. Each grant is conditional upon the employee remaining in service over the next three years. The entity estimates that the fair value of each option is €15.

By the end of year 1, the entity's share price has dropped, and the entity reprices its share options. The repriced share options vest at the end of year 3. The entity estimates that, at the date of repricing, the fair value of each of the original share options granted (i.e. before taking into account the repricing) is €5 and that the fair value of each repriced share option is €8.

40 employees leave during year 1. The entity estimates that a further 70 employees will leave during years 2 and 3, so that there will be 390 employees at the end of year 3 (500 – 40 – 70).

During year 2, a further 35 employees leave, and the entity estimates that a further 30 employees will leave during year 3, so that there will be 395 employees at the end of year 3 (500 – 40 – 35 – 30).

During year 3, 28 employees leave, and hence a total of 103 employees ceased employment during the original three year vesting period, so that, for the remaining 397 employees, the original share options vest at the end of year 3.

IFRS 2 requires the entity to recognise:

- the cost of the original award at grant date (€15 per option) over a three year vesting period beginning at the start of year 1, plus
- the incremental fair value of the repriced options at repricing date (€3 per option, being the €8 fair value of each repriced option less the €5 fair value of the original option) over a two year vesting period beginning at the date of repricing (end of year 1).

This would be calculated as follows:

Year	**Calculation of cumulative expense**		**Cumulative expense (€) (a+b)**	**Expense for period (€)**
	Original award (a)	**Modified award (b)**		
1	390 employees × 100 options × €15 × 1/3		195,000	195,000
2	395 employees × 100 options × €15 × 2/3	395 employees × 100 options × €3 × 1/2	454,250	259,250
3	397 employees × 100 options × €15	397 employees × 100 options × €3	714,600	260,350

In effect, IFRS 2 treats the original award and the incremental value of the modified award as if they were two separate awards.

A similar treatment to that in Example 34.19 above is adopted where the fair value of an award subject to a market condition has its value increased by the removal or mitigation of the market condition. *[IFRS 2.B43(a), B43(c)]*. Where a vesting condition other than a market condition is changed, the treatment set out in 7.3.1.C below is adopted. IFRS 2 does not specifically address the situation where the fair value of an award is increased by the removal or mitigation of a non-vesting condition. It seems appropriate, however, to account for this increase in the same way as for a modification caused by the removal or mitigation of a market condition – i.e. as in Example 34.19 above.

7.3.1.B Increase in number of equity instruments granted

If the modification increases the number of equity instruments granted, the fair value of the additional instruments, measured at the date of modification, must be recognised over the period from the date of modification to the date of vesting for the modified instruments. If there is no further vesting period for the modified instruments, the incremental cost should be recognised immediately. *[IFRS 2.B43(b)]*.

7.3.1.C Removal or mitigation of non-market vesting conditions

Where a vesting condition, other than a market condition, is modified in a manner that is beneficial to the employee, the modified vesting condition should be taken into account when applying the general requirements of IFRS 2 as discussed in 6.1 to 6.4 above – in other words, the entity would continuously estimate the number of awards likely to vest and/or the vesting period. *[IFRS 2.B43(c)]*. This is consistent with the general principle of IFRS 2 that vesting conditions, other than market conditions, are not taken into account in the valuation of awards, but are reflected by recognising a cost for those instruments that ultimately vest on achievement of those conditions. See also the discussion at 7.2 above.

IFRS 2 does not provide an example that addresses this point specifically, but we assume that the intended approach is as in Example 34.20 below. In this Example, the entity modifies an award in a way that is beneficial to the employee even though the modification does not result in any incremental fair value. The effect of the modification is therefore recognised by basing the expense on the original grant date fair value of the awards and an assessment of the extent to which the modified vesting conditions will be met.

Example 34.20: Modification of non-market performance condition in employee's favour

At the beginning of year 1, the entity grants 1,000 share options to each member of its sales team, with exercise conditional upon the employee remaining in the entity's employment for three years, and the team selling more than 50,000 units of a particular product over the three year period. The fair value of the share options is £15 per option at the date of grant.

At the end of year 1, the entity estimates that a total of 48,000 units will be sold, and accordingly records no cost for the award in year 1.

During year 2, there is so severe a downturn in trading conditions that the entity believes that the sales target is too demanding to have any motivational effect, and reduces the target to 30,000 units, which it believes is achievable. It also expects 14 members of the sales team to remain in employment throughout the three year performance period. It therefore records an expense in year 2 of £140,000 (£15 × 14 employees × 1,000 options × 2/3). This cost is based on the originally assessed value of the award (i.e. £15) since the performance condition was never factored into the original valuation, such that any change in performance condition likewise has no effect on the valuation and does not result in any incremental fair value.

By the end of year 3, the entity has sold 35,000 units, and the share options vest as the modified performance condition has been met. Twelve members of the sales team have remained in service for the three year period. The entity would therefore recognise a total cost of £180,000 (12 employees × 1,000 options × £15), giving an additional cost in year 3 of £40,000 (total charge £180,000, less £140,000 charged in year 2).

The difference between the accounting consequences for different methods of enhancing an award could cause confusion in some cases. For example, it may sometimes not be clear whether an award has been modified by increasing the number of equity instruments or by lowering the performance targets, as illustrated in Example 34.21.

Example 34.21: Increase in number of equity instruments or modification of vesting conditions?

An entity grants a performance-related award which provides for different numbers of options to vest after 3 years, depending on different performance targets as follows:

Profit growth	Number of options
5%-10%	100
10%-15%	200
over 15%	300

During the vesting period, the entity concludes that the criteria are too demanding and modifies them as follows:

Profit growth	Number of options
5%-10%	200
over 10%	300

This raises the issue of whether the entity has changed:

(a) the performance conditions for the vesting of 200 or 300 options; or

(b) the number of equity instruments awarded for achieving growth of 5%-10% or growth of over 10%.

In our view, the reality is that the change is to the performance conditions for the vesting of 200 or 300 options, and should therefore be dealt with as in 7.3.1.C, rather than 7.3.1.B, above. Suppose, however, that the conditions had been modified as follows:

Profit growth	Number of options
5%-10%	200
10%-15%	300
over 15%	400

In that case, there has clearly been an increase in the number of equity instruments subject to an award for a growth increase of over 15%, which would have to be accounted for as such (i.e. under 7.3.1.B, rather than 7.3.1.C, above). In such a case, it seems more appropriate also to deal with the changes to the lower bands as changes to the number of shares awarded rather than as changes to the performance conditions.

7.3.2 Modifications that decrease the value of an award

This type of modification does not occur very often, as the effect would be somewhat demotivating and, in some cases, contrary to local labour regulations. However, there have been occasional examples of an award being made more onerous – usually in response to criticism by shareholders that the original terms were insufficiently demanding.

The general requirement of IFRS 2 (as outlined at 7.3 above) is that, where an award is made more onerous (and therefore less valuable), the financial statements must still recognise the cost of the original award. This rule is in part an anti-avoidance measure since, without it, an entity could reverse the cost of an out-of-the-money award by modifying it so that it was unlikely to vest (for example, by adding unattainable non-market performance conditions) rather than cancelling the award and triggering an acceleration of expense as in 7.1 above.

7.3.2.A Decrease in fair value of equity instruments granted

If the modification decreases the fair value of the equity instruments granted (e.g. by increasing the exercise price or reducing the exercise period), the decrease in value is effectively ignored and the entity continues to recognise a cost for services as if the awards had not been modified. *[IFRS 2.B44(a)]*. This approach also applies to reductions in the fair value of an award by the addition of a market condition or by making an existing market condition more onerous. *[IFRS 2.B44(a), B44(c)]*. Although IFRS 2 has no specific guidance on the point, we assume that reductions in the fair value resulting from the addition or amendment of a non-vesting condition are similarly ignored.

Example 34.22: Award modified by replacing a non-market condition with a market condition

At the beginning of year 1, an entity grants 1,000 share options to each of its 10 employees, with exercise conditional upon the employee remaining in the entity's employment for three years, and an earnings per share (EPS) target (non-market condition) being met over the three year period. The fair value of the share options is £15 per option at the date of grant.

At the end of year 1, the entity estimates that all the employees will remain in service until the end of year 3 and that the EPS target will be met. It therefore records a cost of £50,000 for the award in year 1 (£15 × 10 employees × 1,000 options × 1/3).

During year 2, the entity reassesses the arrangement and replaces the EPS target with a share price target (market condition) that must be achieved by the end of year 3. At the date of modification, the fair value of the option with the market condition is £12 and the fair value of the original option is £17. Therefore, the fair value of the awards has decreased as a result of the modification but, under IFRS 2, this decrease is not accounted for and the entity must continue to use the original grant date fair value. An expense must be recognised based on this grant date fair value unless the award does not vest due to failure to meet a service or non-market performance condition specified at the original grant date. At the original grant date the conditions were a service condition and a non-market performance condition. With the removal of the non-market performance condition, the only condition that has been in place since grant date is the service condition.

At the end of year 2 the entity estimates that nine employees will fulfil the service condition by the end of year 3. It therefore records a cumulative expense in year 2 of £90,000 (£15 × 9 employees × 1,000 options × 2/3) and an expense for the year of £40,000 (£90,000 – £50,000).

At the end of year 3 the share price target has not been met but eight employees have met the service condition. The entity therefore recognises a cumulative expense of £120,000 ((£15 × 8 employees × 1,000 options) and an expense for the year of £30,000 (£120,000 – £90,000).

It can be seen that the only expense reversal relates to those employees who have forfeited their options by failing to fulfil the employment condition. There is no reversal of expense for those employees who met the service condition but whose options did not vest (in real terms) because the market condition was not met. In IFRS 2 terms the options of those eight employees vested because all non-market conditions were met and so the entity has to recognise the grant date fair value for those awards. This is the case even though the original grant date fair value did not take account of the effect of the market condition (unlike an award with a market condition specified from grant date). This outcome is the result of the different treatment of market and non-market conditions under IFRS 2 and the requirement to recognise an expense for an award with a market condition provided all other conditions have been met (see further discussion at 6.3.2 above).

7.3.2.B Decrease in number of equity instruments granted

If the modification reduces the number of equity instruments granted, IFRS 2 requires the reduction to be treated as a cancellation of that portion of the award (see 7.4 below). *[IFRS 2.B44(b)]*. Essentially this has the effect that any previously unrecognised cost of the cancelled instruments is immediately recognised in full, whereas the cost of an award whose value is reduced by other means continues to be spread in full over the remaining vesting period.

In situations where a decrease in the number of equity instruments is combined with other modifications so that the total fair value of the award remains the same or increases, it is unclear whether IFRS 2 requires an approach based on the value of the award as a whole or, as in the previous paragraph, one based on each equity instrument as the unit of account. This is considered further at 7.3.4 below.

7.3.2.C Additional or more onerous non-market vesting conditions

Where a non-market vesting condition is modified in a manner that is not beneficial to the employee, again it is ignored and a cost recognised as if the original award had not been modified, as shown by Example 34.23 (which is based on IG Example 8 in the implementation guidance to IFRS 2). *[IFRS 2.B44(c), IG15, IG Example 8]*.

Example 34.23: Award modified by changing non-market performance conditions or service conditions

At the beginning of year 1, the entity grants 1,000 share options to each member of its sales team, conditional upon the employee remaining in the entity's employment for three years, and the team selling more than 50,000 units of a particular product over the three year period. The fair value of the share options is £15 per option at the date of grant. During year 2, the entity believes that the sales target is insufficiently demanding and increases it to 100,000 units. By the end of year 3, the entity has sold 55,000 units, and the modified share options are forfeited. Twelve members of the sales team have remained in service for the three year period.

On the basis that the original target would have been met, and twelve employees would have been eligible for awards, the entity would recognise a total cost of £180,000 (12 employees × 1,000 options × £15) in accordance with the minimum cost requirements of paragraph 27 of IFRS 2. The cumulative cost in years 1 and 2 would, as in the Examples above, reflect the entity's best estimate of the original 50,000 unit sales target being achieved at the end of year 3. If, conversely, sales of only 49,000 units had been achieved, any cost booked for the award in years 1 and 2 would have been reversed in year 3, since the original target of 50,000 units would not have been met.

It is noted in IG Example 8 that the same accounting result would have occurred if the entity had increased the service requirement rather than modifying the performance target. Because such a modification would make it less likely that the options would vest, which would not be beneficial to the employees, the entity would take no account of the modified service condition when recognising the services received. Instead, it would recognise the services received from the twelve employees who remained in service for the original three year vesting period. Other modifications to vesting periods are discussed below.

7.3.3 Modifications with altered vesting period

As noted at 7.3.1 above, where an award is modified so that its value increases, IFRS 2 requires the entity to continue to recognise an expense for the grant date fair value of the unmodified award over its original vesting period, even where the vesting period of the modified award is longer. This appears to have the effect that an expense may need to be recognised for awards that do not actually vest, as illustrated by Example 34.24 (which is based on Example 34.19 above).

Example 34.24: Award modified by reducing the exercise price and extending the vesting period

At the beginning of year 1, an entity grants 100 share options to each of its 500 employees, with vesting conditional upon the employee remaining in service over the next three years. The entity estimates that the fair value of each option is €15.

By the end of year 1, the entity's share price has dropped, and the entity reprices its share options. The repriced share options vest at the end of year 4. The entity estimates that, at the date of repricing, the fair value of each of the original share options granted (i.e. before taking into account the repricing) is €5 and that the fair value of each repriced share option is €7.

40 employees leave during year 1. The entity estimates that a further 70 employees will leave during years 2 and 3, and a further 25 employees during year 4, such that there will be 390 employees at the end of year 3 (500 – 40 – 70) and 365 (500 – 40 – 70 – 25) at the end of year 4.

During year 2, a further 35 employees leave, and the entity estimates that a further 30 employees will leave during year 3 and 30 more in year 4, such that there will be 395 employees at the end of year 3 (500 – 40 – 35 – 30) and 365 (500 – 40 – 35 – 30 – 30) at the end of year 4.

During year 3, 28 employees leave, and hence a total of 103 employees ceased employment during the original three year vesting period, so that, for the remaining 397 employees, the original share options would have vested at the end of year 3. The entity now estimates that only a further 20 employees will leave during year 4, leaving 377 at the end of year 4. In fact 25 employees leave, so that 372 satisfy the criteria for the modified options at the end of year 4.

In our view IFRS 2 requires the entity to recognise:

- the cost of the original award at grant date (€15 per option) over a three year vesting period beginning at the start of year 1, based on the ongoing best estimate of, and ultimately the actual, number of employees at the end of the original three-year vesting period;
- the incremental fair value of the repriced options at repricing date (€2 per option, being the €7 fair value of each repriced option less the €5 fair value of the original option) over a three year vesting period beginning at the date of repricing (end of year one), but based on the ongoing best estimate of, and ultimately the actual, number of employees at the end of the modified four-year vesting period.

This would be calculated as follows:

Year	Calculation of cumulative expense		Cumulative expense (€)	Expense for period (€)
	Original award	Modified award		
1	390 employees × 100 options × €15 × 1/3		195,000	195,000
2	395 employees × 100 options × €15 × 2/3	365 employees × 100 options × €2 × 1/3	419,333	224,333
3	397 employees × 100 options × €15	377 employees × 100 options × €2 × 2/3	645,767	226,434
4	397 employees × 100 options × €15	372 employees × 100 options × €2	669,900	24,133

It may seem strange that a cost is being recognised for the original award in respect of the 25 employees who leave during year 4, who are never entitled to anything. However, in our view, this is consistent with:

- the overall requirement of IFRS 2 that the minimum cost of a modified award should be the cost that would have been recognised if the award had not been modified; and
- IG Example 8 in IFRS 2 (the substance of which is reproduced in Example 34.23 above) where an expense is clearly required to be recognised to the extent that the original performance conditions would have been met if the award had not been modified.

Moreover, as Examples 34.23 and 34.24 illustrate, the rule in IFRS 2 requiring recognition of a minimum expense for a modified award (i.e. as if the original award had remained in place) applies irrespective of whether the effect of the modification is that an award becomes less valuable to the employee (as in Example 34.23) or more valuable to the employee (as in Example 34.24).

Where a modified vesting period is shorter than the original vesting period, all of the expense relating to both the original and modified elements of the award should, in our view, be recognised by the end of the modified vesting period as no services will be rendered beyond that point. In this type of modification – as distinct from a change of estimate where there is a variable vesting period (see 6.2.3 above) – we believe that an entity has an accounting policy choice between retrospective and prospective adjustment of the vesting period as at the modification date. The overall expense recognised between grant date and vesting date will be the same in both cases, but there will be timing differences in the recognition of the expense, with retrospective accounting resulting in a higher expense as at the modification date itself.

7.3.4 Modifications that reduce the number of equity instruments granted but maintain or increase the value of an award ('value for value' exchanges and 'give and take' modifications)

As discussed at 7.3.2.B above, cancellation accounting has to be applied to a reduction in the number of equity instruments when a modification reduces both the number of equity instruments granted and the total fair value of the award. *[IFRS 2.B44(b)]*. This approach is consistent with the fact that part of the award has been removed without compensation to the employee. However, a modification of this kind is rarely seen in practice because of the demotivating effect and, in some jurisdictions, a requirement to pay compensation to the counterparty. An entity is more likely to modify an award so that the overall fair value remains the same, or increases, even if the number of equity instruments is reduced. These types of modification, sometimes known as 'value for value' exchanges or 'give and take' modifications, are considered below.

Where an entity reduces the number of equity instruments but also makes other changes so that the total fair value of the modified award remains the same as, or exceeds, that of the original award as at the modification date, it is unclear whether the unit of account for accounting purposes should be an individual equity instrument or the award as a whole. Examples 34.25 and 34.26 below illustrate the two situations and the two approaches.

Example 34.25: Modification where number of equity instruments is reduced but total fair value of award is unchanged

At the beginning of year 1, an entity granted an employee 200 share options with a grant date fair value of £9 and a vesting period of three years. During years 1 and 2, the entity recognises a cumulative expense of £1,200 (200 × £9 × 2/3). At the end of year 2 the exercise price of the options is significantly higher than the market price and the options have a fair value of £5 per option. On this date, the entity modifies the award and exchanges the 200 underwater options for 100 'at the money' options with a fair value of £10 each. The total fair value of the new awards of £1,000 (100 × £10) equals the total fair value of the awards exchanged (200 × £5), as measured at the modification date.

View 1 is that the unit of account is an individual option. Taking this approach, the decrease in the number of options from 200 to 100 will be accounted for as a cancellation with an acceleration at the modification date of any unexpensed element of the grant date fair value of 100 options (i.e. recognition of an additional amount of £300 (100 × £9 × 1/3)) The grant date fair value of the remaining 100 options continues to be recognised over the remainder of the vesting period together with their incremental fair value following the modification. Therefore, in year 3, there would be an expense of £300 (for the remaining grant date fair value) plus £500 (100 × (£10 – £5)) for the incremental fair value of 100 options. In total, therefore, an expense of £2,300 is recognised.

View 2 is that the total number of options exchanged is the more appropriate unit of account. In this case, the cancellation of the original options and the grant of replacement options are accounted for as one modification. There would therefore be no acceleration of expense in respect of the reduction in the number of options from 200 to 100 and the grant date fair value of the original award would continue to be recognised over the vesting period. In this case, the total expense recognised would be £1,800 (200 × £9).

Example 34.26: Modification where number of equity instruments is reduced but total fair value of award is increased

At the beginning of year 1, an entity granted to its employees 1,000 share options with an exercise price equal to the market price of the shares at grant date. There is a two year vesting period and the grant date fair value is £10 per option. The entity's share price has declined significantly so that the share price is currently significantly less than the exercise price. At the end of year 1, the entity decides to reduce the exercise price of the options and, as part of the modification, it also reduces the number of options from 1,000 to 800. At the date of modification, the fair value of the original options is £7 per option and that of the modified options £11 per option.

View 1 is that the unit of account is an individual option. Taking this approach, the decrease in the number of options from 1,000 to 800 will be accounted for as a cancellation of 200 options with an acceleration at the modification date of any remaining grant date fair value relating to those 200 options. The total expense recognised in year 1 is £6,000 ((800 × £10 × ½) + (200 × £10)). The grant date fair value of the remaining 800 options continues to be recognised over the remainder of the vesting period together with the incremental fair value of those options as measured at the modification date. In total the entity will recognise an expense of £13,200 (original grant date fair value of £10,000 (1,000 × £10) plus incremental fair value of £3,200 (800 × £(11 – 7)).

View 2 is that the unit of account is the total number of options as there are linked modifications forming one package. In this case, the incremental fair value is calculated as the difference between the total fair value before and after the modification. In total the entity will recognise an expense of £11,800 (original grant date fair value of £10,000 (1,000 × £10) plus incremental fair value on modification of £1,800 ((800 × £11) – (1,000 × £7)).

In both Examples above, the first view is based on paragraph B44(b) of IFRS 2 which states that ‘if the modification reduces the number of equity instruments granted to an employee, that reduction shall be accounted for as a cancellation of that portion of the grant, in accordance with the requirements of paragraph 28’. This is perhaps further supported by paragraph B43(a) which, in providing guidance on accounting for a modification that increases the fair value of an equity instrument, appears only to refer to individual equity instruments when it states that ‘the incremental fair value granted’ in a modification is ‘the difference between the fair value of the modified equity instrument and that of the original equity instrument, both estimated as at the date of modification’. *[IFRS 2.B43-44]*.

The second view is based on the overriding requirement in paragraph 27 of IFRS 2 for the grant date fair value of the equity instruments to be recognised unless the awards do not vest due to a failure to meet a vesting condition (other than a market condition) that was specified at grant date. This requirement is applicable even if the award is modified after the grant date. The same paragraph also requires an entity to recognise the effect of modifications ‘that increase the total fair value of the share-based payment arrangement or are otherwise beneficial to the employee’. This reference to ‘total fair value’ supports the view that the total award is the unit of account and is reiterated in paragraphs B42 and B44 which provide guidance, respectively, for situations where the total fair value decreases or increases as a consequence of the modification of an award. Supporters of view 2 further consider that, in contrast to the cancellation accounting approach that is required in the very specific case where part of the award is, in effect, settled for no consideration (see 7.3.2.B above), a modification that reduces the number of equity instruments but maintains or increases the overall fair value of the award clearly provides the counterparty with a benefit. As a consequence, it is considered that no element of the grant date fair value should be accelerated as a cancellation expense. *[IFRS 2.27, B42, B44]*.

Given the lack of clarity in IFRS 2, we believe that an entity may make an accounting policy choice as to whether it considers the unit of account to be an individual equity instrument or an award as a whole. However, once made, that accounting policy choice should be applied consistently to all modifications that reduce the number of equity instruments but maintain or increase the overall fair value of an award. Whichever policy is chosen, the general requirements of IFRS 2 will still need to be applied in order to determine whether or not the amendments to the arrangement are such that it is appropriate to treat the changes as a modification (in IFRS 2 terms) rather than as a completely new award (see 7.4.2 and 7.4.4 below).

7.3.5 *Modification of award from equity-settled to cash-settled (and vice versa)*

Occasionally an award that was equity-settled when originally granted is modified so as to become cash-settled, or an originally cash-settled award is modified so as to become equity-settled. Such modifications are discussed at 9.4 below.

7.4 Cancellation and settlement

Where an award is cancelled or settled (i.e. cancelled with some form of compensation), other than by forfeiture for failure to satisfy the vesting conditions:

(a) if the cancellation or settlement occurs during the vesting period, it is treated as an acceleration of vesting, and the entity recognises immediately the amount that would otherwise have been recognised for services received over the remainder of the vesting period;

(b) where the entity pays compensation for a cancelled award:

  (i) any compensation paid up to the fair value of the award at cancellation or settlement date (whether before or after vesting) is accounted for as a deduction from equity, as being equivalent to the redemption of an equity instrument;

  (ii) any compensation paid in excess of the fair value of the award at cancellation or settlement date (whether before or after vesting) is accounted for as an expense in profit or loss; and

  (iii) if the share-based payment arrangement includes liability components, the fair value of the liability is remeasured at the date of cancellation or settlement. Any payment made to settle the liability component is accounted for as an extinguishment of the liability; and

(c) if the entity grants new equity instruments during the vesting period and, on the date that they are granted, identifies them as replacing the cancelled or settled instruments, the entity is required to account for the new equity instruments as if they were a modification of the cancelled or settled award. Otherwise it accounts for the new instruments as an entirely new award. *[IFRS 2.28, 29]*.

The treatment of the cancelled or settled award in (a) above is similar, in its effect on profit or loss, to the result that would have occurred if:

- the fair value of the equity instruments issued had been recorded in full at grant date with a corresponding debit to a prepayment for 'services to be rendered';
- the prepayment were written off on a periodic basis until cancellation or settlement; and
- any remaining prepayment at the date of cancellation or settlement were written off in full.

It should be noted that the calculation of any additional expense in (b) above depends on the fair value of the award at the date of cancellation or settlement, not on the cumulative expense already charged. This has the important practical consequence that, when an entity pays compensation on cancellation or settlement of an award, it must obtain a fair value for the original award, updated to the date of cancellation or settlement. If the award had not been cancelled or settled, there would have been no need to obtain a valuation for the original award after the date of grant.

These requirements raise some further detailed issues of interpretation on a number of areas, as follows:

- the distinction between 'cancellation' and 'forfeiture' (see 7.4.1 below);
- the distinction between 'cancellation' and 'modification' (see 7.4.2 below);
- the calculation of the expense on cancellation (see 7.4.3 below); and
- replacement awards (see 7.4.4 and 7.5 below).

7.4.1 Distinction between cancellation and forfeiture

The provisions of IFRS 2 summarised at 7.4 above apply when an award of equity instruments is cancelled or settled 'other than a grant cancelled by forfeiture when the vesting conditions are not satisfied'. *[IFRS 2.28]*. The significance of this is that the terms of many share-based awards provide that they are, or can be, 'cancelled', in a legal sense, on forfeiture. IFRS 2 is clarifying that, where an award is forfeited (within the meaning of that term in IFRS 2 – see 6.1.2 above), the entity should apply the accounting treatment for a forfeiture (i.e. reversal of expense previously recognised), even if the award is legally cancelled as a consequence of the forfeiture.

7.4.1.A Termination of employment by entity

Based on the guidance in paragraph 28 of IFRS 2 referred to at 7.4.1 above, it might not always be immediately clear whether cancellation or forfeiture has occurred, particularly where options lapse as the result of a termination of employment by the entity. For example, an entity might grant options to an employee at the beginning of year 1 on condition of his remaining in employment until at least the end of year 3. During year 2, however, economic conditions require the entity to make a number of its personnel, including that employee, redundant, as a result of which his options lapse. Is this lapse a forfeiture or a cancellation for the purposes of IFRS 2?

The uncertainty arises because it could be argued either that the employee will be unable to deliver the services required in order for the options to vest (suggesting a forfeiture) or that the options lapse as a direct result of the employer's actions (suggesting a cancellation).

The IASB addressed this question by amending the definition of 'service condition' in IFRS 2 (see 3.1 above). The definition includes the following guidance:

'... If the counterparty, regardless of the reason, ceases to provide service during the vesting period, it has failed to satisfy the condition. ...' *[IFRS 2 Appendix A]*.

Therefore, IFRS 2 requires the failure to satisfy a service condition as the result of any termination of employment to be accounted for as a forfeiture rather than as a cancellation.

7.4.1.B Surrender of award by employee

It is sometimes the case that an employee, often a member of senior management, will decide – or be encouraged by the entity – to surrender awards during the vesting period. The question arises as to whether this should be treated as a cancellation or forfeiture for accounting purposes. IFRS 2 allows forfeiture accounting, and the consequent reversal of any cumulative expense, only in situations where vesting conditions are not satisfied. A situation where the counterparty voluntarily surrenders an award, and therefore the opportunity to meet the vesting conditions, is a decision within the control of the counterparty rather than a failure to satisfy a vesting condition and should be accounted for as a cancellation rather than as a forfeiture.

In its amendment of IFRS 2 (as discussed at 7.4.1.A above), we do not believe that the IASB's intention was to allow an employee to 'fail' to meet a service condition by voluntarily surrendering an award. Such an action should therefore continue to be treated as a cancellation rather than as a forfeiture.

7.4.2 Distinction between cancellation and modification

One general issue raised by IFRS 2 is where the boundary lies between 'modification' of an award in the entity's favour and outright cancellation of the award. As a matter of legal form, the difference is obvious. However, if an entity were to modify an award in such a way that there was no realistic chance of it ever vesting (for example, by introducing a requirement that the share price increase 1,000,000 times by vesting date), some might argue that this amounts to a *de facto* cancellation of the award. The significance of the distinction is that, whereas the cost of a 'modified' award continues to be recognised on a periodic basis over the vesting period (see 7.3 above), the remaining cost of a cancelled award is recognised immediately.

7.4.3 Calculation of the expense on cancellation

The basic accounting treatment for a cancellation and settlement is illustrated in Example 34.27 below.

Example 34.27: Cancellation and settlement – basic accounting treatment

At the start of year 1 an entity grants an executive 30,000 options on condition that she remain in employment for three years. Each option is determined to have a fair value of $10.

At the end of year 1, the executive is still in employment and the entity charges an IFRS 2 expense of $100,000 (30,000 × $10 × 1/3). At the end of year 2, the executive is still in employment. However, the entity's share price has suffered a decline which the entity does not expect to have reversed by the end of year 3, such that the options, while still 'in the money' now have a fair value of only $6. Moreover, the entity is under pressure from major shareholders to end option schemes with no performance criteria other than continuing employment.

Accordingly, the entity cancels the options at the end of year 2 and in compensation pays the executive $6.50 per option cancelled, a total payment of $195,000 (30,000 options × $6.50).

IFRS 2 first requires the entity to record a cost as if the options had vested immediately. The total cumulative cost for the award must be $300,000 (30,000 options × $10). $100,000 was recognised in year 1, so that an additional cost of $200,000 is recognised.

As regards the compensation payment, the fair value of the awards cancelled is $180,000 (30,000 options × $6.00). Accordingly, $180,000 of the payment is accounted for as a deduction from equity, with the remaining payment in excess of fair value, $15,000, charged to profit or loss.

The net effect of this is that an award that ultimately results in a cash payment to the executive of only $195,000 (i.e. $6.50 per option) has resulted in a total charge to profit or loss of $315,000 (i.e. $10.50 per option, representing $10 grant date fair value + $6.50 compensation payment – $6.00 cancellation date fair value).

Example 34.27 illustrates the basic calculation of the cancellation 'charge' required by IFRS 2. In more complex situations, however, the amount of the 'charge' may not be so clear-cut, due to an ambiguity in the drafting of paragraph 28(a) of the standard, which reads as follows:

> 'the entity shall account for the cancellation or settlement as an acceleration of vesting, and shall therefore recognise immediately the amount that would otherwise have been recognised for services received over the remainder of the vesting period.' *[IFRS 2.28(a)]*.

There is something of a contradiction within this requirement as illustrated by Example 34.28.

Example 34.28: Cancellation and settlement – best estimate of cancellation expense

At the beginning of year 1, entity A granted 150 employees an award of free shares, with a grant date fair value of £5, conditional upon continuous service and performance targets over a 3-year period from grant date. The number of shares awarded varies according to the extent to which targets (all non-market vesting conditions) have been met, and could result in each employee still in service at the end of year 3 receiving a minimum of 600, and a maximum of 1,000 shares.

Half way through year 2 (i.e. 18 months after grant date), A is acquired by B, following which A cancels all of its share awards. At the time of the cancellation, 130 of the original 150 employees were still in employment. At that time, it was A's best estimate that, had the award run to its full term, 120 employees would have received 900 shares each. Accordingly the cumulative expense recognised by A for the award as at the date of takeover would, under the normal estimation processes of IFRS 2 discussed at 6.1 to 6.4 above, be £270,000 (900 shares × 120 employees × £5 × 18/36).

How should A account for the cancellation of this award?

The opening phrase of paragraph 28(a) – 'the entity shall account for the cancellation ... as an acceleration of vesting' – suggests that A should recognise a cost for all 130 employees in service at the date of cancellation. However, the following phrase – '[the entity] shall therefore recognise immediately the amount that would otherwise have been recognised for services received over the remainder of the vesting period' – suggests that the charge should be based on only 120 employees, the best estimate, as at the date of cancellation of the number of employees in whom shares will finally vest. In our view, either reading of paragraph 28(a) is possible.

There is then the issue of the number of shares per employee that should be taken into account in the cancellation charge. Should this be 1,000 shares per employee (the maximum number that could vest) or 900 shares per employee (the number expected by the entity at the date of cancellation actually to vest)?

In our view, it is unclear from the standard whether the intention was that the cancellation charge should be based on the number of shares considered likely, as at the date of cancellation, to vest for each employee (900 shares in this example) or whether it should be based on the maximum number of shares (1,000 shares in this example). Given the lack of clarity, in our view an entity may make an accounting policy choice.

In extreme cases, the entity's best estimate, as at the date of cancellation, might be that no awards are likely to vest. In this situation, no cancellation expense would be recognised. However, there would need to be evidence that this was not just a rather convenient assessment made as at the date of cancellation. Typically, the previous accounting periods would also have reflected a cumulative IFRS 2 expense of zero on the assumption that the awards would never vest.

An effect of these requirements is that IFRS 2 creates an accounting arbitrage between an award that is 'out of the money' but not cancelled (the cost of which continues to be spread over the remaining period to vesting) and one which is formally cancelled (the cost of which is recognised immediately). Entities might well prefer to opt for cancellation so as to create a 'one-off' charge to earnings rather than continue to show, particularly during difficult trading periods, significant periodic costs for options that no longer have any real value. However, such early cancellation of an award precludes any chance of the cost of the award being reversed through forfeiture during, or at the end of, the vesting period if the original vesting conditions are not met.

7.4.4 Replacement awards

The required accounting treatment of replacement awards, whilst generally clear, nevertheless raises some issues of interpretation. Most of this sub-section addresses the replacement of unvested awards but the treatment of vested awards is addressed at 7.4.4.C below.

As set out at 7.4 above, a new award that meets the criteria in paragraph 28(c) of IFRS 2 to be treated as a replacement of a cancelled or settled award is accounted for as a modification of the original award and any incremental value arising from the granting of the replacement award is recognised over the vesting period of that replacement award. Where the criteria are not met, the new equity instruments are accounted for as a new grant (in addition to accounting for the cancellation or settlement of the original arrangement). The requirements are discussed in more detail below.

7.4.4.A Designation of award as replacement award

Whether or not an award is a 'replacement' award (and therefore recognised at only its incremental, rather than its full, fair value) is determined by whether or not the entity designates it as such on the date that it is granted. In other words, the accounting treatment effectively hinges on declared management intent, notwithstanding the IASB's systematic exclusion of management intent from many other areas of financial reporting. The Basis for Conclusions does not really explain the reason for this approach, which is also hard to reconcile with the fact that the value of an award is unaffected by whether, or when, the entity declares it to be a 'replacement' award for the purposes of IFRS 2. Presumably, the underlying reason is to prevent a retrospective, and possibly opportunistic, assertion that an award that has been in issue for some time is a replacement for an earlier award.

Entities need to ensure that designation occurs on grant date as defined by IFRS 2 (see 5.3 above). For example, if an entity cancels an award on 15 March and notifies an employee in writing on the same day of its intention to ask the remuneration committee to grant replacement options at its meeting two months later, on 15 May, such notification (although formal and in writing) may not strictly meet IFRS 2's requirement for designation on grant date (i.e. 15 May). However, in our view, what is important is that the entity establishes a clear link between the cancellation of the old award and the granting of a replacement award even if there is later formal approval of the replacement award following the communication of its terms to the counterparty at the same time as the cancellation of the old award.

As drafted, IFRS 2 gives entities an apparently free choice to designate any newly granted awards as replacement awards. In our view, however, such designation cannot credibly be made unless there is evidence of some connection between the cancelled and replacement awards. This might be that the cancelled and replacement awards involve the same counterparties, or that the cancellation and replacement are part of the same arrangement.

7.4.4.B Incremental fair value of replacement award

Where an award is designated as a replacement award, any incremental fair value must be recognised over the vesting period of the replacement award. The incremental fair value is the difference between the fair value of the replacement award and the 'net fair value' of the cancelled or settled award, both measured at the date on which the replacement award is granted. The net fair value of the cancelled or settled award is the fair value of the award, immediately before cancellation, less any compensation payment that is accounted for as a deduction from equity. *[IFRS 2.28(c)]*. Thus the 'net fair value' of the original award can never be less than zero (since any compensation payment in excess of the fair value of the cancelled award would be accounted for in profit or loss, not in equity – see Example 34.27 at 7.4.3 above).

There is some confusion within IFRS 2 as to whether a different accounting treatment is intended to result from, on the one hand, modifying an award and, on the other hand, cancelling it and replacing it with a new award on the same terms as the modified award. This is explored in the discussion of Example 34.29 below, which is based on the same fact pattern as Example 34.19 at 7.3.1.A above.

Example 34.29: Replacement awards – is there an accounting arbitrage between accounting for a modification and accounting for cancellation and a new grant?

At the beginning of year 1, an entity grants 100 share options to each of its 500 employees. Each grant is conditional upon the employee remaining in service over the next three years. The entity estimates that the fair value of each option is €15.

By the end of year 1, the entity's share price has dropped. The entity cancels the existing options and issues options which it identifies as replacement options, which also vest at the end of year 3. The entity estimates that, at the date of cancellation, the fair value of each of the original share options granted is €5 and that the fair value of each replacement share option is €8.

40 employees leave during year 1. The entity estimates that a further 70 employees will leave during years 2 and 3, so that there will be 390 employees at the end of year 3 (500 – 40 – 70).

During year 2, a further 35 employees leave, and the entity estimates that a further 30 employees will leave during year 3, so that there will be 395 employees at the end of year 3 (500 – 40 – 35 – 30).

During year 3, 28 employees leave, and hence a total of 103 employees ceased employment during the original three year vesting period, so that, for the remaining 397 employees, the replacement share options vest at the end of year 3.

The intention of the IASB appears to have been that the arrangement should be accounted for in exactly the same way as the modification in Example 34.19 above, since the Basis for Conclusions to IFRS 2 notes:

> '...the Board saw no difference between a repricing of share options and a cancellation of share options followed by the granting of replacement share options at a lower exercise price, and therefore concluded that the accounting treatment should be the same.' *[IFRS 2.BC233].*

However, it is not clear that this intention is actually reflected in the drafting of IFRS 2, paragraph 28 of which reads as follows:

> 'If a grant of equity instruments is cancelled or settled during the vesting period (other than a grant cancelled by forfeiture when the vesting conditions are not satisfied):
>
> (a) the entity shall account for the cancellation or settlement as an acceleration of vesting, and shall therefore recognise immediately the amount that otherwise would have been recognised for services received over the remainder of the vesting period.
>
> (b) any payment made to the employee on the cancellation or settlement of the grant shall be accounted for as the repurchase of an equity interest, i.e. as a deduction from equity, except to the extent that the payment exceeds the fair value of the equity instruments granted, measured at the repurchase date. Any such excess shall be recognised as an expense. ...
>
> (c) if new equity instruments are granted to the employee and, on the date when those new equity instruments are granted, the entity identifies the new equity instruments granted as replacement equity instruments for the cancelled equity instruments, the entity shall account for the granting of replacement equity instruments in the same way as a modification of the original grant of equity instruments, in accordance with paragraph 27 and the guidance in Appendix B...'. *[IFRS 2.28].*

As a matter of natural construction, paragraph (a) requires the cancellation of the existing award to be treated as an acceleration of vesting – explicitly and without qualification. In particular there is no rider to the effect that the requirement of paragraph (a) is to be read as 'subject to paragraph (c) below'.

Paragraph (c) requires any 'new equity instruments' granted to be accounted for in the same way as a modification of the original grant of equity instruments. It does not require this treatment for the cancellation of the original instruments, because this has already been addressed in paragraph (a).

Moreover, in order to construe paragraphs (a) and (c) in a manner consistent with the Basis for Conclusions to the standard, it would be necessary to read paragraph (c) as effectively superseding paragraph (a). However, for this to be a valid reading, it would also be necessary to read paragraph (b) as also superseding paragraph (a), and this would produce a manifestly incorrect result, namely that, if an award is cancelled and settled, there is no need ever to expense any part of the cancelled award not yet expensed at the date of cancellation.

The application of, firstly, the main text of IFRS 2 and, secondly, the Basis for Conclusions to IFRS 2 to the entity in Example 34.29 is set out below.

The main text in IFRS 2 appears to require the entity to recognise:

- The entire cost of the original options at the end of year 1 (since cancellation has the effect that they are treated as vesting at that date), based on the 390 employees expected at that date to be in employment at the end of the vesting period. This is not the only possible interpretation of the requirement of paragraph 28(a) – see below and the broader discussion in Example 34.28 at 7.4.3 above.
- For the options replacing the 390 cancelled awards, the incremental fair value of the replacement options at repricing date (€3 per option, being the €8 fair value of each replacement option less the €5 fair value of each cancelled option) over a two year vesting period beginning at the date of cancellation (end of year 1), based on the (at first estimated and then actual) number of employees at the end of year 3 (i.e. the final number could be less than the estimate of 390).
- For any additional replacement options (i.e. replacement options awarded in excess of the 390 × 100 options that were expected to vest at cancellation date), the full incremental fair value at repricing date (being the €8 fair value of each replacement option) over a two year vesting period beginning at the repricing date (end of year 1). The expense is based on the (at first estimated and then actual) number of employees in excess of 390 at the end of year 3.

This would be calculated as follows:

Year	Calculation of cumulative expense Original award	Replacement award	Cumulative expense (€)	Expense for period (€)
1	390 employees × 100 options × €15	–	585,000	585,000
2	390 employees × 100 options × €15	390 employees × 100 options × €3 × 1/2 5 employees × 100 options × €8 × 1/2	645,500	60,500
3	390 employees × 100 options × €15	390 employees × 100 options × €3 7 employees × 100 options × €8	707,600	62,100

By contrast, the accounting treatment implied by the Basis for Conclusions is as follows (see Example 34.19 above):

Year	Calculation of cumulative expense Original award (a)	Modified award (b)	Cumulative expense (€) (a+b)	Expense for period (€)
1	390 employees × 100 options × €15 × 1/3	–	195,000	195,000
2	395 employees × 100 options × €15 × 2/3	395 employees × 100 options × €3 × 1/2	454,250	259,250
3	397 employees × 100 options × €15	397 employees × 100 options × €3	714,600	260,350

It will be seen that both the periodic allocation of expense and the total expense differ under each interpretation. This is because, under the first interpretation, the cost of the original award is accelerated at the end of year 1 for all 390 employees expected at that date to be in employment at the end of the vesting period, whereas under the second interpretation a cost is recognised for the 397 employees whose awards finally vest. The difference between the two total charges of €7,000 (€714,600 – €707,600) represents 397 – 390 = 7 employees @ €1,000 [100 options × €10[€15 + €3 – €8]] each = €7,000.

We believe that either interpretation is valid, and an entity should adopt one or other consistently as a matter of accounting policy.

In Example 34.29 above, we base the cancellation calculations on 390 employees (the number expected to be employed at the end of the vesting period as estimated at the cancellation date) rather than on 460 employees (the number in employment at the cancellation date). As discussed in Example 34.28 at 7.4.3 above, either approach may be adopted but the selected approach should be applied consistently.

The illustrative examples above involve a relatively straightforward fact pattern where, as at the date of cancellation and replacement, there was an amount to accelerate in respect of the cancelled awards and an incremental fair value associated with the replacement awards. In other scenarios, the two accounting outcomes might result in greater divergence. For example, if the cancelled awards were expected never to vest, because performance conditions had become unachievable and this had been the conclusion for some time (see 7.4.3 above), the cancelled awards might have a value of zero on a cancellation basis and the full value of the replacement awards would be recognised. If modification accounting were applied, however, the entity would have to recognise the grant date fair value of the cancelled awards plus any incremental value of the replacement awards over the fair value of the cancelled awards as at cancellation date. The latter approach might result in a significantly higher cost.

The discussion above relates to situations in which awards are cancelled and replaced for reasons other than expected, or actual, failure by the counterparty to meet a service condition. Changes to awards in contemplation, or as a consequence, of cessation of employment are considered at 5.3.9.B above and at 7.5 and 7.6 below.

7.4.4.C Replacement of vested awards

The rules for replacement awards summarised in paragraph (c) at 7.4 above apply 'if a grant of equity instruments is cancelled or settled during the vesting period ...'. *[IFRS 2.28]*. However, if the original award has already vested when a replacement award is granted, there is no question of accelerating the cost of the cancelled award, as it has already been recognised in full during the vesting period. The issue is rather the treatment of the new award itself. IFRS 2 does not explicitly address this point but it appears that such a replacement award should be treated in the same way as a completely new award. In other words, its full fair value should be recognised immediately or, if there are any vesting conditions for the replacement award, over its vesting period.

By contrast, the rules for modification of awards discussed in 7.3 above apply whether the award has vested or not. Paragraphs 26 and 27 of IFRS 2 (modifications) are not restricted to events 'during the vesting period' in contrast to paragraph 28 (cancellation and settlement, including replacement awards), which is restricted to events 'during the vesting period'. *[IFRS 2.26-28]*.

This has the effect that the accounting cost of modifying an already vested award (i.e. the incremental fair value of the modified award) may, at first sight, appear to be lower than the cost of cancelling and replacing it, which requires the full fair value of the new award to be expensed. However, the full fair value of the new replacement award will be reduced by the fair value of the cancelled award that the employee has surrendered as part of the consideration for the new award. This analysis will, in many cases, produce an accounting outcome similar to that of the modification of an unvested award.

7.5 Replacement and *ex gratia* awards on termination of employment

When an employee's employment is terminated during the vesting period of an award of shares or options, the award will typically lapse in consequence, in other words applying IFRS 2 the award is 'forfeited' (see 6.1.2 and 7.4 above). It is common in such situations, particularly where the employee was part of the senior management, for the entity to make an alternative award, or to allow the employee to retain existing awards, as part of the package of benefits agreed with the employee on termination of employment.

Generally, such an award is an *ex gratia* award – in other words, it is a discretionary award to which the outgoing employee had no legal entitlement under the terms of the original award. However, a number of plan rules set out, in a 'good leaver' clause (see 5.3.9 above), the terms on which any *ex gratia* award may be made, usually by applying a formula to determine, or limit, how much of the original award can be considered to have vested.

In many cases the award will be made on a fully vested basis, i.e. the employee has full entitlement without further conditions needing to be fulfilled. In other cases, however, an employee will be allowed to retain awards that remain subject to the fulfilment of the original conditions (other than future service). Whichever form the award takes, in IFRS 2 terms it will be treated as vesting at the date of termination of employment because any remaining conditions will be accounted for as non-vesting conditions in the absence of an explicit or implied service condition (see 3.2 above).

As discussed at 7.4.1.A above, IFRS 2 requires an entity to apply forfeiture (rather than cancellation) accounting to awards that lapse if an employee is unable to satisfy a service condition for any reason. In amending the standard to make clear that forfeiture accounting applied to the termination of employment, the IASB did not specifically address the accounting for any replacement or *ex gratia* awards on termination of employment.

If the original award is accounted for as a forfeiture and any previously recognised cost reversed in anticipation of the employee's expected departure, it perhaps follows that any replacement award will be treated as a completely new award and recognised and measured based on its own grant date. However, the standard is not clear and there might be situations where entities consider it more appropriate to apply modification accounting (recognising the original grant date fair value of the award that would otherwise be forfeited on its original terms (because the service condition would not be met) plus the incremental value of the modified terms). In the absence of clarity in IFRS 2, we believe that judgement will be required based on the specific facts and circumstances and the extent to which the changes to the arrangements are considered to be a waiver of existing conditions in connection with the cessation of employment rather than the introduction of a discretionary replacement arrangement on completely new terms.

Example 34.30: Replacement award on termination of employment

At the beginning of year 1, an executive is granted the right to 10,000 free shares on condition of remaining in service until the end of year 3. The fair value of the award at grant date is £2.00 per share.

At the end of year 2, the executive's employment is terminated and he therefore loses his right to any shares. However, as *ex gratia* (voluntary) compensation, the remuneration committee awards him 6,667 shares vesting immediately. As at the end of year 2 the share price was £4.00, and the fair value of the original award was £3.60 per share. (This is lower than the current share price because the holder of a share is entitled to receive any dividends paid during year 3 whereas the holder of an unvested right to a share is not – see 8.5.4 below.)

This raises the question of how the *ex gratia* award of 6,667 shares should be accounted for. The factors to be considered in determining the grant date in such cases are discussed further at 5.3.9 above. For the purposes of this Example, it is assumed that the replacement award is treated as having been granted, or the original award is treated as having been modified, at the end of year 2 rather than the terms being in place as at the beginning of year 1.

Where the lapse is treated as a forfeiture, the entity:

- reverses the cost already booked for the award of £13,333 (10,000 shares × £2 × 2/3); and
- recognises the cost of the *ex gratia* award (at the fair value at that award's grant date) of £26,668 (6,667 shares × £4).

This results in a net charge on termination of £13,335.

If the lapse is treated as a modification of the original award, the entity:

- accelerates the cost not yet booked for the original award of £6,667 (10,000 shares × £2 = £20,000, less £13,333 already recognised – see above) as there is no future service period; and
- treats the *ex gratia* award as a replacement award at incremental value. The fair value of the replacement award of £26,668 (6,667 shares × £4 – see above) is compared to the fair value of the original award of £36,000 (10,000 shares × £3.60). Since the fair value of the replacement award is less than that of the original award, there is no incremental cost required to be recorded under IFRS 2.

This results in a net charge on termination of £6,667.

Example 34.30 assumes that the entity treats the entire award as the unit of account. An entity that has instead made a policy choice to base its modification accounting on an individual share or option as the unit of account (see further discussion at 7.3.4 above) will have a different accounting outcome.

7.6 Entity's plans for future modification or replacement of award – impact on estimation process at reporting date

As discussed at 6.1.1 and 6.1.2 above, IFRS 2 requires an entity to determine a cumulative IFRS 2 charge at each reporting date by reference to the 'best available estimate' of the number of awards that will vest (within the special meaning of that term in IFRS 2).

In addition to the normal difficulties inherent in any estimation process, it is not entirely clear which anticipated future events should be taken into account in the IFRS 2 estimation process and which should not, as illustrated by Example 34.31 below.

Example 34.31: Estimation of number of awards expected to vest – treatment of anticipated future events

At the beginning of year 1, an entity granted an award of 1,000 shares to each of its 600 employees at a particular manufacturing unit. The award vests on completion of three years' service. As at the end of year 1, the entity firmly intends to close the unit, and terminate the employment of employees, as part of a rationalisation programme. This closure would occur part way through year 2. The entity has not, however, announced its intentions or taken any other steps so as to allow provision for the closure under IAS 37 – *Provisions, Contingent Liabilities and Contingent Assets* (see Chapter 26 at 6.1).

Under the original terms of the award, the award would lapse on termination of employment. However, the entity intends to compensate employees made redundant by changing the terms of their award so as to allow full vesting on termination of employment.

What is the 'best estimate', as at the end of year 1, of the number of awards expected to vest? Specifically should the entity:

(a) ignore the intended closure altogether, on the grounds that there is no other recognition of it in the financial statements;

(b) take account of the impact of the intended closure on vesting of the current award, but ignore the intended future change to the terms of the award to allow vesting; or

(c) take account of both the intended closure and the intended change to the terms of the award?

In our view, there is no basis in IFRS 2 for accounting for an anticipated future change to the terms of an award. The entity must account for those awards in issue at the reporting date, not those that might be in issue in the future. Accordingly we do not consider approach (c) above to be appropriate if any change to the issued awards was simply an intention.

Equally, we struggle to support approach (a) above. IFRS 2 requires the entity to use its 'best available estimate' and its best available estimate as at the end of year 1 must be that the unit will be closed, and the employees' employment terminated, in year 2. This view is supported by the fact that, unlike IAS 36 – *Impairment of Assets* (see Chapter 20) and IAS 37 (see Chapter 26), IFRS 2 does not explicitly prohibit an entity from taking account of the consequences of reorganisations and similar transactions to which it is not yet committed.

Accordingly, we believe that approach (b) should be followed under IFRS 2.

The entity's best estimate at the end of year 1 must be that none of the awards currently in place will vest (because all the employees will be made redundant and so will not meet the service condition before the end of the vesting period). It therefore applies forfeiture accounting at the end of year 1 and reverses any cost previously recorded for the award.

When the terms of the award are changed at the time of the redundancy in year 2 to allow full vesting, the entity will either recognise the full cost of the new award (as all cost relating to the original award has been reversed) or will treat the revised arrangement as a modification of the original award that is beneficial to the employee. In effect, the modification approach is based on a view that the original award is not now going to lapse because it will be modified before employment ceases and the forfeiture crystallises. In our view, in the absence of clarity in IFRS 2, the entity should assess the more appropriate approach based on the particular facts and circumstances.

Either approach will have what many may see as the less than ideal result that the entity will recognise a credit in profit or loss in year 1 and an expense in year 2, even though there has been no change in management's best estimate of the overall outcome. This follows from the analysis, discussed above, that we do not believe that the entity can account in year 1 for the award on the basis of what its terms may be in year 2.

The best estimate is made as at each reporting date. A change in estimate made in a later period in response to subsequent events affects the accounting expense from that later period only (i.e. there is no restatement of earlier periods presented).

7.7 Two awards running 'in parallel'

In some jurisdictions, it is not straightforward to cancel or modify an award. This may be because cancellation or modification triggers either a legal requirement for the entity to pay compensation to the holder, or adverse tax consequences for the holder. In such cases, where an award has become unattractive (for example, because it is 'out-of-the-money'), the entity may issue a second award rather than cancel or modify the original award. The second award cannot be designated as a replacement award, because the original award is still in place. The entity therefore has two awards running 'in parallel'.

However, a mechanism is then put in place to ensure that the employee can receive only one award. For instance, if the original award were 1,000 options, it might be replaced with a second award of 1,000 options, but on condition that, if options under one award are exercised, the number of options exercisable under the other award is correspondingly reduced, so that no more than 1,000 options can be exercised in total.

The accounting for such arrangements is discussed in Example 34.32 below.

Example 34.32: Two option awards running in parallel

At the beginning of year 1, an entity granted 1,000 A options to an employee, subject to non-market vesting conditions. The grant date fair value of an A option was €50.

As at the beginning of year 2, the entity's share price is significantly below the exercise price of an A option, which now has a fair value of €5. Without modifying or cancelling the A options, the entity awards the employee 1,000 new B options. The B options are subject to non-market vesting conditions different in nature from, and more onerous than, those applicable to the A options, but have a lower exercise price. The terms of the B options include a provision that for every A option that is exercised, the number of B options that can be exercised is reduced by one, and *vice versa*. The fair value of a B option at the beginning of year 2 is €15.

Clearly, the employee will exercise whichever series of options, A or B, has the higher intrinsic value. There are four possible outcomes:

1. Neither the A options nor the B options vest.
2. Only the A options vest.
3. Only the B options vest.
4. Both the A options and B options vest and the employee must choose which to exercise. Rationally, the employee would exercise the B options as they have the lower exercise price.

In our view, the B options are most appropriately accounted for as if they were a modification of the A options. In substance the A options have been modified by adding alternative non-market vesting conditions with a different option exercise price.

On the date of the substantive modification, the entity estimates the fair value of both the original and modified options and calculates the incremental fair value of the modification. As only one series of options can be exercised, we believe that the most appropriate treatment is to account for whichever award the entity believes, at each reporting date, is more likely to be exercised. This is analogous to the accounting treatment we suggest in Example 34.12 at 6.2.5 above and in Example 34.17 at 6.3.6 above.

If the entity believes that neither award will vest, any expense previously recorded would be reversed.

If the entity believes that only the A options will vest, it will recognise expense based on the grant date fair value of the A options (€50 each).

If the entity believes that only the B options will vest, it will recognise expense based on:

(a) the grant date fair value of the A options (€50 each) over the original vesting period of the A options, plus

(b) the incremental fair value of the B options, as at their grant date (€10 each, being their €15 fair value less the €5 fair value of an A option), over the vesting period of the B options.

If the entity believes that both the A options and B options will vest, it follows the accounting treatment of outcome 3 above (i.e. vesting of the B options). This is because the employee will either choose the B options or, if the employee decides to choose the A options, the entity has to expense both the value of the A options and the incremental value of the B options because that incremental value relates to a vested award.

The entity revises the assessment at each reporting date and at the end of the vesting period when the actual outcome is known, so that the cumulative expense is based on the actual outcome.

Examples of other types of arrangement with multiple outcomes are illustrated at 6.2.5 above and at 10.3 and 15.4 below.

7.8 Share splits and consolidations

It is common for an entity to divide its existing equity share capital into a larger number of shares (share splits) or to consolidate its existing share capital into a smaller number of shares (share consolidations). The impact of such splits and consolidations is not specifically addressed in IFRS 2, and a literal application of IFRS 2 could lead to some rather anomalous results.

Suppose that an employee has options over 100 shares in the reporting entity, with an exercise price of £1. The entity undertakes a '1 for 2' share consolidation – i.e. the number of shares in issue is halved such that, all other things being equal, the value of one share in the entity after the consolidation is twice that of one share before the consolidation.

IFRS 2 is required to be applied to modifications to an award arising from equity restructurings. *[IFRS 2.BC24]*. In many cases, a share scheme will provide for automatic adjustment so that, following the consolidation, the employee holds options over only 50 shares with an exercise price of £2. As discussed at 5.3.8.A above, all things being equal, it would be expected that the modified award would have the same fair value as the original award and so there would be no incremental expense to be accounted for.

However, it may be that the scheme has no such provision for automatic adjustment, such that the employee still holds options over 100 shares. The clear economic effect is that the award has been modified, since its value has been doubled. It could be argued that, on a literal reading of IFRS 2, no modification has occurred, since the employee holds options over 100 shares at the same exercise price before and after the consolidation. The Interpretations Committee discussed this issue at its July and November 2006 meetings but decided not to take it onto its agenda because it 'was not a normal commercial occurrence and ... unlikely to have widespread significance'.[23] This decision was re-confirmed by the Interpretations Committee in March 2011.[24] In our view, whilst it seems appropriate to have regard to the substance of the transaction, and treat it as giving rise to a modification, it can be argued that IFRS 2 as drafted does not require such a treatment, particularly given the decision of the Interpretations Committee not to discuss the issue further.

Sometimes, the terms of an award give the entity discretion to make modifications at a future date in response to more complex changes to the share structure, such as those arising from bonus issues, share buybacks and rights issues where the effect on existing options may not be so clear-cut. These are discussed further at 5.3.8.A above.

8 EQUITY-SETTLED TRANSACTIONS – VALUATION

8.1 Introduction

The IASB provides some guidance on valuation in Appendix B to the standard, which we summarise and elaborate upon below. The guidance is framed in terms of awards to employees which are valued at grant date, but many of the general principles are equally applicable to awards to non-employees valued at service date. *[IFRS 2.B1]*.

As discussed in more detail at 4 to 7 above, IFRS 2 requires a 'modified grant-date' approach, under which the fair value of an equity award is estimated on the grant date without regard to the possibility that any service conditions or non-market performance vesting conditions will not be met. Although the broad intention of IFRS 2 is to recognise the cost of the goods or services to be received, the IASB believes that, in the case of services from employees, the fair value of the equity instruments awarded is more readily determinable than the fair value of the services received.

As noted at 5.1 above, IFRS 2 defines fair value as 'the amount for which an asset could be exchanged, a liability settled, or an equity instrument granted could be exchanged, between knowledgeable, willing parties in an arm's length transaction'.

IFRS 2 requires fair value to be based on the market price of the equity instruments, where available, or calculated using an option-pricing model. While fair value may be readily determinable for awards of shares, market quotations are not available for long-term, non-transferable share options because these instruments are not generally traded.

As discussed further at 8.2.2 below, the fair value of an option at any point in time is made up of two basic components – intrinsic value and time value. Intrinsic value is the greater of (a) the market value of the underlying share less the exercise price of the option and (b) zero.

Time value reflects the potential of the option for future gain to the holder, given the length of time during which the option will be outstanding, and possible changes in the share price during that period. Because market price information is not normally available for an employee share option, the IASB believes that, in the absence of such information, the fair value of a share option awarded to an employee generally must be estimated using an option-pricing model. *[IFRS 2.BC130]*. This is discussed further at 8.3 below.

The discussion below aims to provide guidance on the valuation of options and similar awards under IFRS 2; it is not intended to provide detailed instructions for constructing an option pricing model.

The approach to determining the fair value of share-based payments continues to be that specified in IFRS 2 as share-based payments fall outside the scope of IFRS 13 which applies more generally to the measurement of fair value under IFRSs (see Chapter 14). *[IFRS 2.6A]*.

8.2 Options

8.2.1 Call options – overview

Before considering the features of employee share options that make their valuation particularly difficult, a general overview of call options may be useful.

Call options give the holder the right, but not the obligation, to buy the underlying shares at a specified price (the 'exercise' or 'strike' price) on, or before, a specified date. Share-based payments take the form of call options over the underlying shares.

Options are often referred to as American or European. American options can be exercised at any time up to the expiry date, whereas European options can be exercised only on the expiry date itself.

The terms of employee options commonly have features of both American and European options, in that there is a period, generally two or three years, during which the option cannot be exercised (i.e. the vesting period). At the end of this period, if the options vest, they can be exercised at any time up until the expiry date. This type of option is known as a Window American option or Bermudan option.

A grant of shares is equivalent to an option with an exercise price of zero and will be exercised regardless of the share price on the vesting date. Throughout the discussion below, any reference to share options therefore includes, to the extent applicable, share grants or zero strike price options. There is further discussion of grants of free shares at 8.7.1 below.

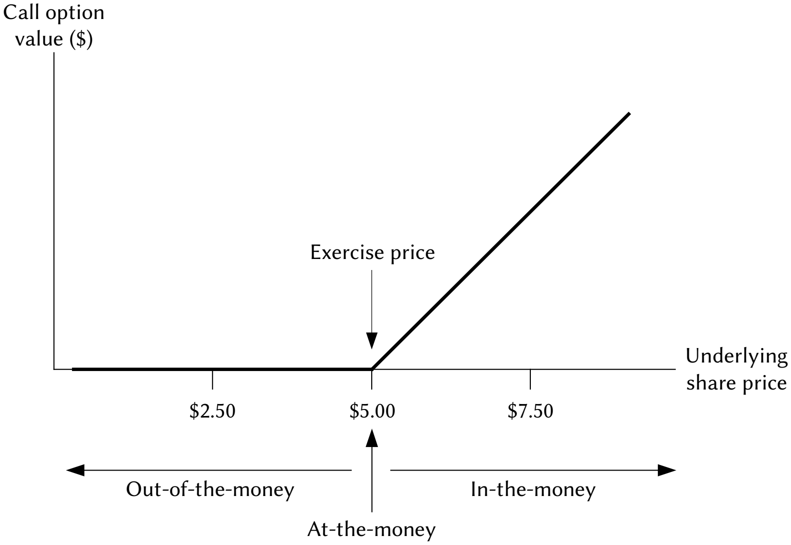
8.2.2 Call options – valuation

As noted in 8.1 above, option value consists of intrinsic value and time value. For a call option, intrinsic value is the greater of:

- the share price less the exercise price, and
- zero.

Figure 34.2 below sets out the intrinsic value (or payoff) for a call option with an exercise price of $5.00.

Figure 34.2: Intrinsic value of a call option



A call option is said to be 'in-the-money' when the share price is above the exercise price of the option and 'out-of-the-money' when the share price is less than the exercise price. An option is 'at-the-money' when the share price equals the exercise price of the option.

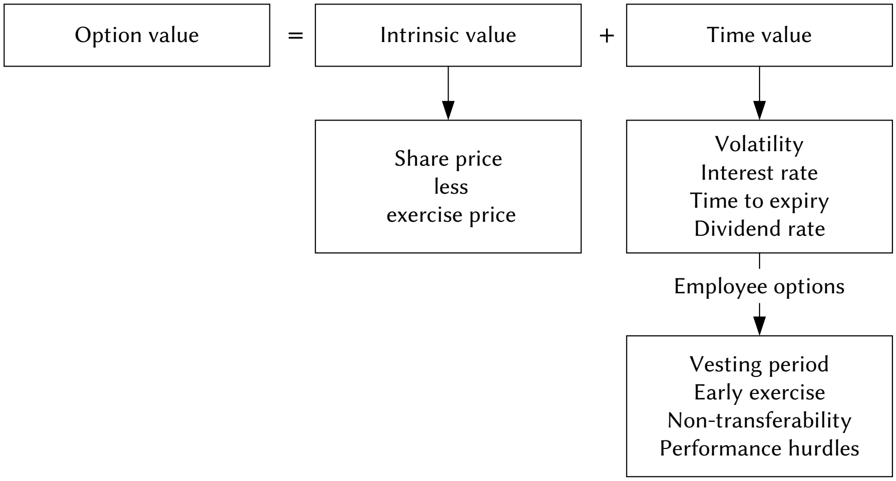
The time value of an option arises from the time remaining to expiry. As well as the share price and the exercise price, it is impacted by the volatility of the share price, time to expiry, dividend yield and the risk-free interest rate and the extent to which it is in- or out-of-the-money. For example, when the share price is significantly less than the exercise price, the option is said to be 'deeply' out-of-the-money. In this case, the fair value consists entirely of time value, which decreases the more the option is out-of-the-money.

The main inputs to the value of a simple option are:

- the exercise price of the option;
- the term of the option;
- the current market price of the underlying share;
- the expected future volatility of the price of the underlying share;
- the dividends expected to be paid on the shares during the life of the option (if any); and
- the risk-free interest rate(s) for the expected term of the option.

Their effect on each of the main components of the total value (intrinsic value and time value) is shown in Figure 34.3 below.

Figure 34.3: Determinants of the fair value of a call option



Option value
=
Intrinsic value
+
Time value
Share price
less
exercise price
Volatility
Interest rate
Time to expiry
Dividend rate
Employee options
Vesting period
Early exercise
Non-transferability
Performance hurdles

The effect of these inputs on the value of a call option can be summarised as follows:

If this variable increases,	**the option value ...**
Share price	Increases
Exercise price	Decreases
Volatility	Increases
Time to expiry	Usually increases*
Interest rate	Increases
Dividend yield/payout	Decreases

* In most cases the time value of an option is positive. Whilst an American option always has positive or zero time value, a European option may have a zero or negative time value when there is a high dividend yield and the option is considerably in-the-money. In this case, as the time to expiry increases, a European call option will reduce in value (negative time value) and an American call option will stay constant in value (zero time value).

The factors to be considered in estimating the determinants of an option value in the context of IFRS 2 are considered in more detail at 8.5 below.

8.2.3 Factors specific to employee share options

In addition to the factors referred to in 8.2.2 above, employee share options are also affected by a number of specific factors that can affect their true economic value. These factors, not all of which are taken into account for IFRS 2 valuation purposes (see 8.4 and 8.5 below), include the following:

- non-transferability (see 8.2.3.A below);
- continued employment requirement (see 8.2.3.B below);
- vesting and non-vesting conditions (see 8.2.3.C below);
- periods during which holders cannot exercise their options – referred to in various jurisdictions as 'close', 'restricted' or 'blackout' periods (see 8.2.3.D below);

- limited ability to hedge option values (see 8.2.3.E below); and
- dilution effects (see 8.2.3.F below).

8.2.3.A Non-transferability

Holders of freely-traded share options (i.e. those outside a share-based payment transaction) can choose to 'sell' their options (typically by writing a call option on the same terms) rather than exercise them. By contrast, employee share options are generally non-transferable, leading to early (and sub-optimal) exercise of the option. This will lower the value of the options.

8.2.3.B Continued employment requirement

Holders of freely-traded share options can maintain their positions until they wish to exercise, regardless of other circumstances. In contrast, employee share options cannot normally be held once employment is terminated. If the options have not vested, they will be lost. If the options have vested, the employee will be forced to exercise the options immediately or within a short timescale, or forfeit them altogether, losing all time value. This will lower the value of the options.

8.2.3.C Vesting and non-vesting conditions

Holders of freely-traded share options have an unconditional right to exercise their options. In contrast, employee share options may have vesting and non-vesting conditions attached to them, which may not be met, reducing their value. This is discussed in more detail in 8.4 below.

Although a non-market vesting condition reduces the 'true' fair value of an award, it does not directly affect its valuation for the purposes of IFRS 2 (see 6.2 above). However, non-market vesting conditions may indirectly affect the value. For example, when an award vests on satisfaction of a particular target rather than at a specified time, its value may vary depending on the assessment of when that target will be met, since that may influence the expected life of the award, which is relevant to its fair value under IFRS 2 (see 6.2.3 and 8.2.2 above and 8.5.1 below).

8.2.3.D Periods during which exercise is restricted

Holders of freely-traded American or Bermudan share options can exercise at any time during the exercisable window. In contrast, employees may be subject to 'blackout' periods in which they cannot exercise their options, for example to prevent insider trading. While this could conceivably make a significant impact if the shares were significantly mis-priced in the market, in an efficient market blackout periods will only marginally decrease the value.

8.2.3.E Limited ability to hedge option values

In the case of freely-traded share options, it is reasonable to justify the theoretical valuation on the basis that, for any other value, arbitrage opportunities could arise through hedging. In contrast, employee share options are usually awarded only in relatively small amounts, and the employees are usually subject to restrictions on share trading (especially short selling the shares, as would be required to hedge an option). When considered in combination with the non-transferability of the options (see 8.2.3.A above), this means that exercising the options is the only way to remove exposure to fluctuations in value, which lowers the value of the options.

8.2.3.F Dilution effects

When third parties write traded share options, the writer delivers shares to the option holder when the options are exercised, so that the exercise of the traded share options has no dilutive effect. By contrast, if an entity writes share options to employees and, when those share options are exercised, issues new shares (or uses shares previously repurchased and held in treasury) to settle the awards, there is a dilutive effect as a result of the equity-settled awards. As the shares will be issued at the exercise price rather than the current market price at the date of exercise, this actual or potential dilution may reduce the share price, so that the option holder does not make as large a gain as would arise on the exercise of similar traded options which do not dilute the share price.

8.3 Selection of an option-pricing model

Where, as will almost always be the case, there are no traded options over the entity's equity instruments that mirror the terms of share options granted to employees, IFRS 2 requires the fair value of options granted to be estimated using an option-pricing model. The entity must consider all factors that would be considered by knowledgeable, willing market participants in selecting a model. *[IFRS 2.B4-5]*.

The IASB decided that it was not necessary or appropriate to prescribe the precise formula or model to be used for option valuation. It notes that there is no particular option pricing model that is regarded as theoretically superior to the others, and there is the risk that any model specified might be superseded by improved methodologies in the future. *[IFRS 2.BC131]*.

The three most common option-pricing methodologies for valuing employee options are:

- the Black-Scholes-Merton formula (see 8.3.1 below);
- the binomial model (see 8.3.2 below); and
- the Monte Carlo Simulation (see 8.3.3 below).

It is important to understand all the terms and conditions of a share-based payment arrangement, as this will influence the choice of the most appropriate option pricing model.

IFRS 2 names the Black-Scholes-Merton formula and the binomial model as examples of acceptable models to use when estimating fair value, *[IFRS 2.BC152]*, while noting that there are certain circumstances in which the Black-Scholes-Merton formula may not be the most appropriate model (see 8.3.1 below). Moreover, there may be instances where, due to the particular terms and conditions of the share-based payment arrangement, neither of these models is appropriate, and another methodology is more appropriate to achieving the intentions of IFRS 2. A model commonly used for valuing more complex awards is Monte Carlo Simulation (often combined with the Black-Scholes-Merton formula or the binomial model). This can deal with the complexities of a plan such as one with a market condition based on relative total shareholder return (TSR), which compares the return on a fixed sum invested in the entity to the return on the same amount invested in a peer group of entities.

8.3.1 The Black-Scholes-Merton formula

The Black-Scholes-Merton methodology is commonly used for assessing the value of a freely-traded put or call option and allows for the incorporation of static dividends on shares. The assumptions underlying the Black-Scholes-Merton formula are as follows:

- the option can be exercised only on the expiry date (i.e. it is a European option);
- there are no taxes or transaction costs and no margin requirements;
- the volatility of the underlying asset is constant and is defined as the standard deviation of the continuously compounded rates of return on the share over a specified period;
- the risk-free interest rate is constant over time;
- short selling is permitted;
- there are no risk-free arbitrage opportunities;
- there are log normal returns (i.e. the continuously compounded rate of return is normally distributed); and
- security trading is continuous.

The main limitation of the Black-Scholes-Merton methodology is that it only calculates the option price at one point in time. It does not consider the steps along the way when there could be a possibility of early exercise of an American option (although as discussed at 8.4 below this can be partially mitigated by using an assumed expected term as an input to the calculation).

The Black-Scholes-Merton formula is an example of a closed-form model, which is a valuation model that uses an equation to produce an estimated fair value. The formula is as shown in Figure 34.4 below.

Figure 34.4: The Black-Scholes-Merton formula

$$c = S_0 e^{-qT} N(d_1) - K e^{-rT} N(d_2)$$

Where:

$$d_1 = \frac{\ln(S_0/K) + (r - q + \sigma^2/2)T}{\sigma \sqrt{T}}$$

$$d_2 = d_1 - \sigma \sqrt{T}$$

c = price of a written call
S_0 = price of the underlying share
N = the cumulative probability distribution function for a standardised normal distribution
q = dividend yield (continuously compounded)
K = call option exercise price
r = the continuously compounded risk-free rate
σ = annualised volatility of the underlying share
T = time to expiry (in years)

Note: 'e' represents the mathematical constant, the base of the natural logarithm (2.718282...), and 'ln' is the natural logarithm of the indicated value

Whilst the Black-Scholes-Merton formula is complex, its application in practice is relatively easy. It can be programmed into a spreadsheet, and numerous programs and calculators exist that use it to calculate the fair value of an option. As a result, the formula is used widely by finance professionals to value a large variety of options. However, a number of the assumptions underlying the formula may be better suited to valuing short-term, exchange-traded share options rather than employee share options.

The attributes of employee share options that render the Black-Scholes-Merton formula less effective as a valuation technique include:

- *Long term to expiry*

  The formula assumes that volatility, interest rates and dividends are constant over the life of the option. While this may be appropriate when valuing short-term options, the assumption of constant values is less appropriate when valuing long-term options.

- *Non-transferability and early exercise*

  The formula assumes a fixed maturity/exercise date. While IFRS 2 provides for the use of an 'expected term' in place of the contractual life to reflect the possibility of early exercise resulting from the non-transferability of employee share options or other reasons (see 8.5 below), this may not adequately describe early exercise behaviour.

- *Vesting conditions and non-vesting conditions*

  The formula does not take into account any market-based vesting conditions or non-vesting conditions.

- *Blackout periods*

  As the formula assumes exercise on a fixed date, and does not allow earlier exercise, it does not take into consideration any blackout periods (see 8.2.3.D above).

In summary, application of the Black-Scholes-Merton formula is relatively simple, in part because many of the complicating factors associated with the valuation of employee share options cannot be incorporated into it directly and, therefore, must be derived outside of the formula (e.g. the input of an expected term).

IFRS 2 states that the Black-Scholes-Merton formula may not be appropriate for long-lived options which can be exercised before the end of their life and which are subject to variation in the various inputs to the model over the life of the option. However, IFRS 2 suggests that the Black-Scholes-Merton formula may give materially correct results for options with shorter lives and with a relatively short exercise period. *[IFRS 2.B5]*.

The development of appropriate assumptions for use in the Black-Scholes-Merton formula is discussed at 8.5 below.

As noted above, the Black-Scholes-Merton formula is an example of a closed form model that is not generally appropriate for awards that include market performance conditions. However, in certain circumstances it may be possible to use closed form solutions other than the Black-Scholes-Merton formula to value options where, for example, the share price has to reach a specified level for the options to vest. These other solutions are beyond the scope of this chapter.

8.3.2 The binomial model

The binomial model is one of a subset of valuation models known as lattice models, which adopt a flexible, iterative approach to valuation that can capture the unique aspects of employee share options. A binomial model produces an estimated fair value based on the assumed changes in prices of a financial instrument over successive periods of time. In each time period, the model assumes that at least two price movements are possible. The lattice represents the evolution of the value of either a financial instrument or a market variable for the purpose of valuing a financial instrument.

The concepts that underpin lattice models and the Black-Scholes-Merton formula are the same, but the key difference between a lattice model and a closed-form model is that a lattice model is more flexible. The valuations obtained using the Black-Scholes-Merton formula and a lattice model will be very similar if the lattice model uses identical assumptions to the Black-Scholes-Merton calculation (e.g. constant volatility, constant dividend yields, constant risk-free rate, the same expected life). However, a lattice model can explicitly use dynamic assumptions regarding the term structure of volatility, dividend yields, and interest rates.

Further, a lattice model can incorporate assumptions about how the likelihood of early exercise of an employee share option may increase as the intrinsic value of that option increases, or how employees may have a high tendency to exercise options with significant intrinsic value shortly after vesting.

In addition, a lattice model can incorporate market conditions that may be part of the design of an option, such as a requirement that an option is only exercisable if the underlying share price reaches a certain level (sometimes referred to as 'target share price' awards). The Black-Scholes-Merton formula is not generally appropriate for awards that have a market-based performance condition because it cannot handle that additional complexity.

Most valuation specialists believe that lattice models, through their versatility, generally provide a more accurate estimate of the fair value of an employee share option with market performance conditions or with the possibility of early exercise than a value based on a closed-form Black-Scholes-Merton formula. As a general rule, the longer the term of the option and the higher the dividend yield, the larger the amount by which the binomial lattice model value may differ from the Black-Scholes-Merton formula value.

To implement the binomial model, a 'tree' is constructed the branches (or time steps) of which represent alternative future share price movements over the life of the option. In each time step over the life of the option, the share price has a certain probability of moving up or down by a certain percentage amount. It is important to emphasise the assumption, in these models, that the valuation occurs in a risk-neutral world, where investors are assumed to require no extra return on average for bearing risks and the expected return on all securities is the risk-free interest rate.

To illustrate how the binomial model is used, Example 34.33 below constructs a simple binomial lattice model with a few time steps. The valuation assumptions and principles will not differ in essence from those in a Black-Scholes-Merton valuation except that the binomial lattice model will allow for early exercise of the option. The relevant difference between the two models is the specification of a very small number of time steps, for illustrative purposes, in the binomial lattice model (see also 8.3.2.A below). We discuss below how the model can be augmented for a more complex set of assumptions.

Example 34.33: Binomial model

A share option is issued with an exercise price of \$10, being the share price on the grant date. This Example assumes a constant volatility (50%) and risk-free rate (5% continuously compounded) although, as discussed later, those static assumptions may not be appropriate when valuing a long-term share option. It is also assumed that: the grantor pays dividends with a yield of 2% (continuously compounded) on its shares; the term of the option is five years; and each branch of the tree represents a length of time of one year.

At t = 0 (the grant date), the model is started at the grant date share price (\$10 in this Example). At each node (the base of any price time step), two possible price changes (one increase and one decrease) are computed based on the volatility of the shares. The two new share prices are computed as follows:

The up-node price utilises the following formula:

$u = e^{\sigma\sqrt{dt}} = e^{0.5*\sqrt{1}} = 1.6487$

Where:

σ = annualised volatility of the underlying share

dt = period of time between nodes

The down-node is the inverse of the up-node:

$$d = \frac{1}{u} = \frac{1}{1.6487} = 0.6065$$

The probability of each upward and downward price movement occurring is calculated from:

- the probability of an upward movement in price:

$$p = \frac{e^{(r-q)dt} - d}{u - d} = \frac{e^{(.05-.02)*1} - 0.6065}{1.6487 - 0.6065} = 0.4068$$

  Where:

  e = represents the mathematical constant, the base of the natural logarithm (2.718282...)

  r = continuously compounded risk-free rate

  q = dividend yield (continuously compounded)

  dt = period of time between nodes

- the probability of a downward movement in price:

  $= 1 - p = 1 - 0.4068 = 0.5932$

Using the above price multiples, the price tree can then be constructed as shown diagrammatically below – each rising node is built by multiplying the previous price by ‘u’ and each falling node is similarly calculated by multiplying the previous price by ‘d’.

To calculate the option value:

- The option payoffs at the final time node (time 5 above) must be calculated. This is the share price less the exercise price, or zero if the payoff is negative.
- Then the option values must be calculated at the previous time point (time 4 above). This is done by calculating the expected value of the option for the branch paths available to the particular node being valued discounted at the risk-free rate. For example, for $S_{4,4}$ in the chart above the option value is the probability of going to node $S_{5,5}$ multiplied by the option value at that node plus the probability of going to node $S_{5,4}$ multiplied by the option value at that node, all discounted at the risk-free rate):

  $$= e^{-r.dt}\{p.111.82 + (1 - p)34.82\} = 0.95\{0.4068 \times 111.82 + 0.5932 \times 34.82\} = 62.92$$

  This would be the value at node $S_{4,4}$ if the option were European and could not be exercised earlier. As the binomial model can allow for early exercise, the option value at node $S_{4,4}$ is the greater of the option value just calculated and the intrinsic value of the option which is calculated the same way as the end option payoff. In this case, as the intrinsic value is $63.89 ($73.89 – $10.00), the node takes the value of $63.89.
- The previous steps are then repeated throughout the entire lattice (i.e. for all nodes at time 4, then all nodes at time 3, etc.) until finally the option value is determined at time 0 – this being the binomial option value of $4.42.
- Additionally, if there is a vesting period during which the options cannot be exercised, the model can be adjusted so as not to incorporate the early exercise condition stipulated in the previous point and allow for this only after the option has vested and has the ability to be exercised before expiry.

One of the advantages of a lattice model is its ability to depict a large number of possible future paths of share prices over the life of the option. In Example 34.33 above, the specification of an interval of 12 months between nodes provides an inappropriately narrow description of future price paths. The shorter the interval of time between each node, the more accurate will be the description of future share price movements.

Additions which can be made to a binomial model (or any type of lattice model) include the use of assumptions that are not fixed over the life of the option. Binomial trees may allow for conditions dependent on price and/or time, but in general do not support price-path dependent conditions and modifications to volatility. This may affect the structure of a tree making it difficult to recombine. In such cases, additional recombination techniques should be implemented, possibly with the use of a trinomial tree (i.e. one with three possible outcomes at each node).

For the first three assumptions above, the varying assumptions simply replace the value in the fixed assumption model. For instance, in Example 34.33 above r = 0.05; in a time-dependent version this could be 0.045 at time 1, 0.048 at time 2 and so on, depending on the length of time from the valuation date to the individual nodes.

However, for a more complicated addition such as assumed withdrawal rates, the equation:

$$= e^{-r.dt}\{p.111.82 + (1 - p)34.82\}$$

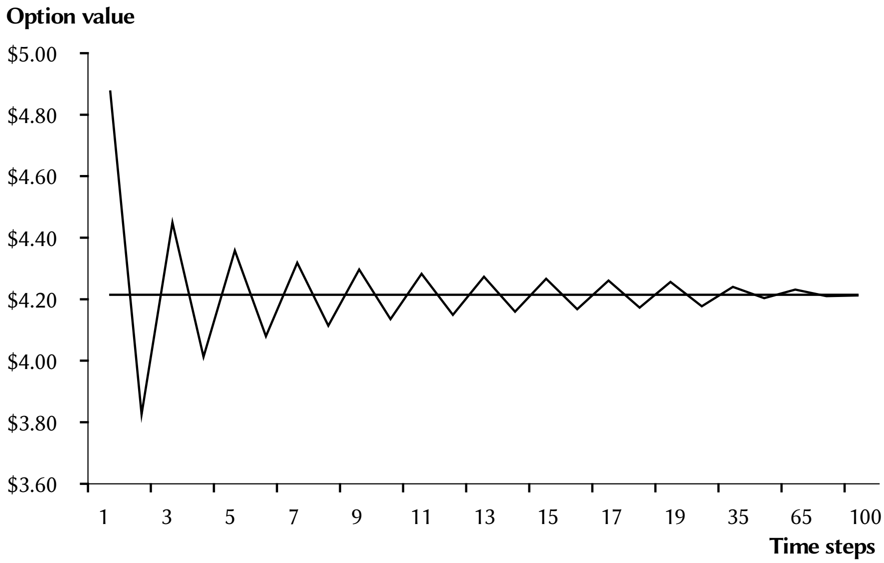
may be replaced with

$$= (1 - g) \times e^{-r.dt}\{p.111.82 + (1 - p)34.82\} + g \times \max(\text{intrinsic value}, 0)$$

where 'g' is the rate of employee departure, on the assumption that, on departure, the option is either forfeited or exercised. As with the other time- and price-dependent assumptions, the rate of departure could also be made time- or price-dependent (i.e. the rate of departure could be assumed to increase as the share price increases, or increase as time passes, and so forth).

8.3.2.A Lattice models – number of time steps

When performing a lattice valuation, a decision must be taken as to how many time steps to use in the valuation (i.e. how much time passes between each node). Generally, the greater the number of time steps, the more accurate the final value. However, as more time steps are added, the incremental increase in accuracy declines. To illustrate the increases in accuracy, consider the diagram below, which values the option in Example 34.33 above as a European option. In this case, the binomial model has not been enhanced to allow for early exercise (i.e. the ability to exercise prior to expiry).



Whilst the binomial model is very flexible and can deal with much more complex assumptions than the Black-Scholes-Merton formula, there are certain complexities it cannot handle, which can best be accomplished by Monte Carlo Simulation – see 8.3.3 below.

The development of appropriate assumptions for use in a binomial model is discussed at 8.5 below.

In addition to the binomial model, other lattice models such as trinomial models or finite difference algorithms may be used. Discussion of these models is beyond the scope of this publication.

8.3.3 Monte Carlo Simulation

In order to value options with market-based performance targets where the market value of the entity's equity is an input to the determination of whether, or to what extent, an award has vested, the option methodology applied must be supplemented with techniques such as Monte Carlo Simulation.

A typical market performance condition is a TSR condition. TSR compares the return on a fixed sum invested in the entity to the return on the same amount invested in a peer group of entities. Typically, the entity is then ranked in the peer group and the number of share-based awards that vest depends on the ranking. For example, no award might vest for a low ranking, the full award might vest for a higher ranking, and a pro-rated level of award might vest for a median ranking.

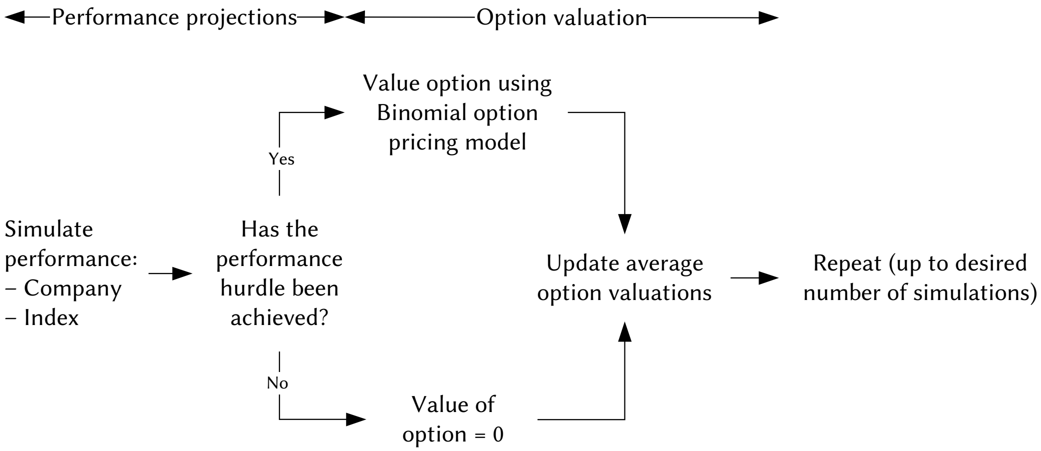
The following table gives an example of a possible vesting pattern for such a scheme, with a peer group of 100 entities.

Ranking in peer group	**Percentage vesting**
Below 50	0%
50	50%
51-74	50% plus an additional 2% for each increase of 1 in the ranking
75 or higher	100%

Figure 34.5 below summarises the Monte Carlo approach.

Other market performance conditions may have the form of share price targets, absolute share price growth or share price growth in excess of a pre-defined index growth. These types of market performance conditions are valued using techniques such as Monte Carlo simulation.

Figure 34.5: Monte Carlo Simulation approach for share-based payment transactions



Performance projections
Option valuation
Value option using Binomial option pricing model
Yes
Simulate performance: – Company – Index
Has the performance hurdle been achieved?
Update average option valuations
Repeat (up to desired number of simulations)
No
Value of option = 0

The valuation could be performed using either:

- a binomial valuation or the Black-Scholes-Merton formula, dependent on the results of the Monte Carlo Simulation; or
- the Monte Carlo Simulation on its own.

The framework for calculating future share prices uses essentially the same underlying assumptions as lie behind Black-Scholes-Merton and binomial models – namely a risk-neutral world and a log normal distribution of share prices.

For a given simulation, the risk-neutral returns of the entity and those of the peer group or index are projected until the performance target is achieved and the option vests. At this point, the option transforms into a 'vanilla' equity call option that may be valued using an option pricing model. This value is then discounted back to the grant date so as to give the value of the option for a single simulation.

When the performance target is not achieved and the option does not vest, a zero value is recorded. This process is repeated thousands or millions of times. The average option value obtained across all simulations provides an estimate of the value of the option, allowing for the impact of the performance target.

8.4 Adapting option-pricing models for share-based payment transactions

Since the option-pricing models discussed in 8.3 above were developed to value freely-traded options, a number of adjustments are required in order to account for the restrictions usually attached to share-based payment transactions, particularly those with employees. The restrictions not accounted for in these models include:

- non-transferability (see 8.4.1 below); and
- vesting conditions, including performance targets, and non-vesting conditions that affect the value for the purposes of IFRS 2 (see 8.4.2 below).

8.4.1 Non-transferability

As noted at 8.2.3.A above, employee options and other share-based awards are almost invariably non-transferable, except (in some cases) to the employee's estate in the event of death in service. Non-transferability often results in an option being exercised early (i.e. before the end of its contractual life), as this is the only way for the employee to realise its value in cash. Therefore, by imposing the restriction of non-transferability, the entity may cause the effective life of the option to be shorter than its contractual life, resulting in a loss of time value to the holder. *[IFRS 2.BC153-169]*.

One aspect of time value is the value of the right to defer payment of the exercise price until the end of the option term. When the option is exercised early because of non-transferability, the entity receives the exercise price much earlier than it otherwise would. Therefore, as noted by IFRS 2, the effective time value granted by the entity to the option holder is less than that indicated by the contractual life of the option.

IFRS 2 requires the effect of early exercise as a result of non-transferability and other factors to be reflected either by modelling early exercise in a binomial or similar model or by using expected life rather than contractual life as an input into the option-pricing model. This is discussed further at 8.5.1 below.

Reducing the time to expiry effectively reduces the value of the option. This is a simplified way of reducing the value of the employee stock option to reflect the fact that employees are unable to sell their vested options, rather than applying an arbitrary discount to take account of non-transferability.

8.4.2 Treatment of vesting and non-vesting conditions

Many share-based payment awards to employees have vesting and non-vesting conditions attached to them which must be satisfied before the award can be exercised. It must be remembered that a non-market vesting condition, while reducing the 'true' fair value of an award, does not directly affect its valuation for the purposes of IFRS 2 (see 6.2 above). However, non-market vesting conditions may indirectly affect the value. For example, when an award vests on satisfaction of achieving a particular operational target rather than at a specified time, its value may vary depending on the assessment of when that target will be met, since that may influence the expected life of the award, which is relevant to its fair value under IFRS 2 (see 6.2.3 and 8.2.2 above and 8.5 below).

8.4.2.A Market-based performance conditions and non-vesting conditions

As discussed at 6.3 and 6.4 above, IFRS 2 requires market-based vesting conditions and non-vesting conditions to be taken into account in estimating the fair value of the options granted. Moreover, the entity is required to recognise a cost for an award with a market condition or non-vesting condition if all the non-market vesting conditions attaching to the award are satisfied regardless of whether the market condition or non-vesting condition is satisfied. This means that a more sophisticated option pricing model may be required.

8.4.2.B Non-market vesting conditions

As discussed at 6.2 above, IFRS 2 requires non-market vesting conditions to be ignored when estimating the fair value of share-based payment transactions. Instead, such vesting conditions are taken into account by adjusting the number of equity instruments included in the measurement of the transaction (by estimating the extent of forfeiture based on failure to vest) so that, ultimately, the amount recognised is based on the number of equity instruments that eventually vest.

8.5 Selecting appropriate assumptions for option-pricing models

IFRS 2 notes that, as discussed at 8.2.2 above, option pricing models take into account, as a minimum:

- the exercise price of the option;
- the life of the option (see 8.5.1 and 8.5.2 below);
- the current price of the underlying shares;
- the expected volatility of the share price (see 8.5.3 below);
- the dividends expected on the shares (if appropriate – see 8.5.4 below); and
- the risk-free interest rate for the life of the option (see 8.5.5 below). *[IFRS 2.B6]*.

Of these inputs, only the exercise price and the current share price are objectively determinable. The others are subjective, and their development will generally require significant analysis. The discussion below addresses the development of assumptions for use both in a Black-Scholes-Merton formula and in a lattice model.

IFRS 2 requires other factors that knowledgeable, willing market participants would consider in setting the price to be taken into account, except for those vesting conditions and reload features that are excluded from the measurement of fair value – see 5 and 6 above and 8.9 below. Such factors include:

- restrictions on exercise during the vesting period or during periods where trading by those with inside knowledge is prohibited by securities regulators; or
- the possibility of the early exercise of options (see 8.5.1 below). *[IFRS 2.B7-9]*.

However, the entity should not consider factors that are relevant only to an individual employee and not to the market as a whole (such as the effect of an award of options on the personal motivation of an individual). *[IFRS 2.B10]*.

The objective of estimating the expected volatility of, and dividends on, the underlying shares is to approximate the expectations that would be reflected in a current market or negotiated exchange price for the option. Similarly, when estimating the effects of early exercise of employee share options, the objective is to approximate the expectations about employees' exercise behaviour that would be developed by an outside party with access to detailed information at grant date. Where (as is likely) there is a range of reasonable expectations about future volatility, dividends and exercise behaviour, an expected value should be calculated, by weighting each amount within the range by its associated probability of occurrence. *[IFRS 2.B11-12]*.

Such expectations are often based on past data. In some cases, however, such historical information may not be relevant (e.g. where the business of the entity has changed significantly) or even available (e.g. where the entity is unlisted or newly listed). An entity should not base estimates of future volatility, dividends or exercise behaviour on historical data without considering the extent to which they are likely to be reasonably predictive of future experience. *[IFRS 2.B13-15]*.

8.5.1 Expected term of the option

IFRS 2 allows the estimation of the fair value of an employee share award to be based on its expected life, rather than its maximum term, as this is a reasonable means of reducing the value of the award to reflect its non-transferability.

Option value is not a linear function of option term. Rather, value increases at a decreasing rate as the term lengthens. For example, a two year option is worth less than twice as much as a one year option, if all other assumptions are equal. This means that to calculate a value for an award of options with widely different individual lives based on a single weighted average life is likely to overstate the value of the entire award. Accordingly, assumptions need to be made as to what exercise or termination behaviour an option holder will exhibit. Considerations include:

- vesting period – the expected term of the option must be at least as long as its vesting period. The length of time employees hold options after they vest may vary inversely with the length of the vesting period;
- past history of employee exercise and termination patterns for similar grants (adjusted for current expectations) – see 8.5.2 below;
- expected volatility of the underlying share – on average, employees tend to exercise options on shares with higher volatility earlier;
- periods during which exercise may be precluded and related arrangements (e.g. agreements that allow for exercise to occur automatically during such periods if certain conditions are satisfied);
- employee demographics (age, tenure, sex, position etc.); and
- time from vesting date – the likelihood of exercise typically increases as time passes.

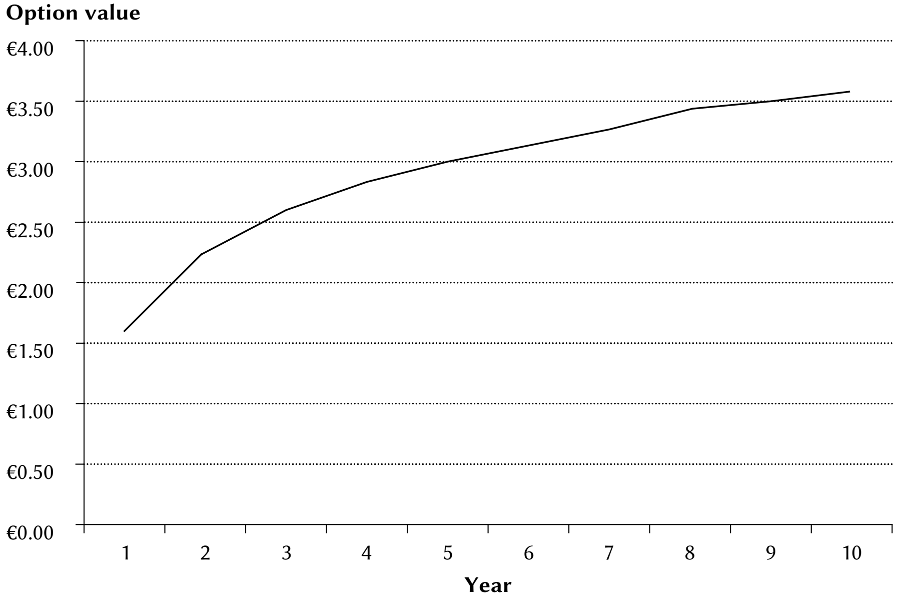
As discussed at 8.4 above, IFRS 2 notes that the effect of early exercise can be reflected:

- by treating the expected, rather than the contractual, life of the option as an input to a pricing model, such as the Black-Scholes-Merton formula (see 8.5.1.A below); or
- by using contractual life as an input to a binomial or similar model. *[IFRS 2.B16-17]*.

8.5.1.A Expected term under the Black-Scholes-Merton formula

An estimate of expected term based on the types of inputs described above can be used in the Black-Scholes-Merton formula as well as a lattice model. However, the formula requires only a single expected term to be used. This is one of the reasons why the Black-Scholes-Merton formula may provide a higher valuation for the same options than a lattice model.

The difference in value that arises from using only a single expected term results, in part, from the convex shape of a typical option valuation curve, as illustrated below.



It is assumed, for the purposes of this illustration, that an at-the-money option on a €10 share with a 10-year contractual term is equally likely to be exercised at the end of each year beginning with year two. An average expected term of six years [(2+3+4+...10)/9] would be used in a Black-Scholes-Merton calculation giving a fair value of €3.10 for the option. If, instead, nine separate valuations were performed, each with a different expected term corresponding to each of the possible terms (from two to ten years), the average of those valuations (also calculated using the Black-Scholes-Merton formula) would be €2.9854. The latter amount is lower than €3.10 because of the convex shape of the valuation curve, reflecting the fact that the value increases at a decreasing rate as the term lengthens. Therefore, the value of the share option with an average expected term of six years will exceed the value derived from averaging the separate valuations for each potential term.

In a lattice model, exercise can occur at any time based on the rules specified in the model regarding exercise behaviour. The lattice model can therefore be thought of as analogous to the calculation in the above example in which the fair value was calculated as the average of the valuations from periods two to ten. In contrast, the Black-Scholes-Merton valuation allows only a single expected term to be specified. Therefore, it is analogous to the valuation described in the above example based on a single average expected term of six years.

Therefore, even if the expected term derived from a lattice model were used as an input in the Black-Scholes-Merton formula (and all other inputs were identical), the two models would give different values.

To mitigate the impact of the convex shape of the valuation curve, an entity with a broad-based share option plan might consider stratifying annual awards into different employee groups for the purposes of estimating the expected option lives (see 8.5.2 below).

Determining a single expected term can be quite challenging, particularly for an entity seeking to base its estimate on the periods for which previously granted options were outstanding, which would have been highly dependent on the circumstances during those periods. For example, if the entity's share price had increased significantly during the option period (as would be the case for share options granted by certain entities at the beginning of a bull market), it is likely that employees would have exercised options very soon after vesting. Alternatively, if options were granted at the end of a bull market and the share price declined significantly after the grant date, it is likely that the options would be exercised much later (if at all). These relationships would exist because, as discussed previously, the extent to which an option is in-the-money has a significant impact on exercise behaviour. Accordingly, deriving a single expected term in these situations involves considerable judgement.

8.5.2 Exercise and termination behaviour

IFRS 2 notes that employees often exercise options early for a number of reasons, most typically:

- restrictions on transferability mean that this is the only way of realising the value of the option in cash;
- aversion to the risk of not exercising 'in the money' options in the hope that they increase in value; or
- in the case of leavers, a requirement to exercise, or forfeit, all vested options on or shortly after leaving (see 8.5.2.B below).

Factors to consider in estimating early exercise include:

(a) the length of the vesting period, because the share option cannot be exercised until the end of the vesting period. Hence, determining the valuation implications of expected early exercise is based on the assumption that the options will vest;

(b) the average length of time similar options have remained outstanding in the past;

(c) the price of the underlying shares. Experience may indicate that employees tend to exercise options when the share price reaches a specified level above the exercise price;

(d) the employee's level within the organisation. For example, experience might indicate that higher-level employees tend to exercise options later than lower-level employees (see also 8.5.2.A below); and

(e) the expected volatility of the underlying shares. On average, employees might tend to exercise options on highly volatile shares earlier than on shares with low volatility. *[IFRS 2.B18]*.

In addition, the pattern of terminations of employment after vesting may be relevant (see 8.5.2.B below).

In our view, past exercise behaviour should generally serve as the starting point for determining expected exercise behaviour. That behaviour should be analysed, correlated to the factors above, and extrapolated into the future. However, significant changes in the underlying share price or in other salient characteristics of the entity, changes in option plans, tax laws, share price volatility and termination patterns may indicate that past exercise behaviour is not indicative of expected exercise behaviour. The expected life may also be estimated indirectly, by using a modified option pricing model to compute an option value, an input to which is an assumption that the options will be expected to be exercised when a particular share price is reached.

Some entities, including recently listed entities, or entities for which all outstanding grants have been out-of-the-money for a long period, may simply not be able to observe any exercise behaviour or may not possess enough history to perform a reasonable analysis of past exercise behaviour. In these cases, in our view, entities may have to look to the exercise history of employees of similar entities to develop expectations of employee exercise behaviour. At present there is only limited publicly-available information about employee exercise patterns, but valuation professionals and human resource consultants may have access to relevant data, based on which they may have articulated specific exercise patterns. In such circumstances, considerable judgement is required in assessing the comparability and appropriateness of the historic data used (including whether the data is current).

In the absence of extensive information regarding exercise behaviour, another solution could be to use a midpoint assumption – i.e. selecting as the expected date of exercise the midpoint between the first available exercise date (the end of the vesting period) and the last available exercise date (the contracted expiry date). However, this should be undertaken only when the entity is satisfied that this does not lead to a material misstatement. It is also plausible to assume exercise at the earliest possible time or to undertake a reasonable analysis of past behaviour and set up the amount of intrinsic value which, when exceeded, will trigger exercise of the option.

8.5.2.A Grouping employees with homogeneous exercise behaviour

IFRS 2 emphasises that the estimated life of an option is critical to its valuation. Therefore, where options are granted to a group of employees, it will generally be necessary to ensure that either:

(a) all the employees are expected to exercise their options within a relatively narrow time-frame; or

(b) if not, that the group is divided into sub-groups of employees who are expected to exercise their options within a similar relatively narrow time-frame.

IFRS 2 suggests that it may become apparent that middle and senior management tend to exercise options later than lower-level employees, either because they choose to do so, or because they are encouraged or compelled to do so as a result of required minimum levels of ownership of equity instruments (including options) among more senior employees. *[IFRS 2.B19-21]*.

8.5.2.B Post-vesting termination behaviour

Most employee share options provide that, if employment is terminated, the former employee typically has only a short period (e.g. 90 days from the date of termination of employment) in which to exercise any vested options, the contractual expiry of which would otherwise be some years away. Accordingly, an entity should look at its prior termination patterns, adjust those patterns for future expectations and incorporate those expected terminations into a lattice model as expected early exercises.

Patterns of employee turnover are not necessarily linear and may be a non-linear function of a variety of factors, such as:

- employee demographics (age, sex, tenure, position, etc.);
- path of share price – for example, if options are deeply out-of-the-money, they may have little retention value and more employees may leave than if the options were at- or in-the-money; and
- economic conditions and other share prices.

8.5.3 Expected volatility of share price

Expected volatility is a measure of the amount by which a price is expected to fluctuate during a period. Share price volatility has a powerful influence on the estimation of the fair value of an option, much of the value of which is derived from its potential for appreciation. The more volatile the share price, the more valuable the option. It is therefore essential that the choice of volatility assumption can be properly supported.

IFRS 2 notes that the measure of volatility used in option pricing models is the annualised standard deviation of the continuously compounded rates of return on the share over a period of time. Volatility is typically expressed in annualised terms that are comparable regardless of the time period used in the calculation (for example, daily, weekly or monthly price observations).

The expected annualised volatility of a share is the range within which the continuously compounded annual rate of return is expected to fall approximately two-thirds of the time. For example, to say that a share with an expected continuously compounded rate of return of 12% has a volatility of 30% means that the probability that the rate of return on the share for one year will be between minus 18% (12% – 30%) and 42% (12% + 30%) is approximately two-thirds. If the share price is €100 at the beginning of the year, and no dividends are paid, the year-end share price would be expected to be between €83.53 (€100 × $e^{-0.18}$) and €152.20 (€100 × $e^{0.42}$) approximately two-thirds of the time.

The rate of return (which may be positive or negative) on a share for a period measures how much a shareholder has benefited from dividends and appreciation (or depreciation) of the share price. *[IFRS 2.B22-24]*.

IFRS 2 gives examples of factors to consider in estimating expected volatility including the following: *[IFRS 2.B25]*

- *Implied volatility from traded share options*

  Implied volatility is the volatility derived by using an option pricing model with the traded option price (if available) as an input and solving for the volatility as the unknown on the entity's shares. It may also be derived from other traded instruments of the entity that include option features (such as convertible debt).

  Implied volatilities are often calculated by analysts and reflect market expectations for future volatility as well as imperfections in the assumptions in the valuation model. For this reason, the implied volatility of a share may be a better measure of prospective volatility than historical volatility (see below). However, traded options are usually short-term, ranging in general from one month to two years. If the expected lives are much longer than this, both the implied and historical volatilities will need to be considered.

- *Historical volatility*

  It may be relevant to consider the historical volatility of the share price over the most recent period that is generally commensurate with the expected term of the option (taking into account the remaining contractual life of the option and the effects of expected early exercise). However, this assumes that past share price behaviour is likely to be representative of future share price behaviour. Upon any restructuring of an entity, the question of whether or not past volatility will be likely to predict future volatility would need to be reassessed.

  The historical volatilities of similar entities may be relevant for newly listed entities, unlisted entities or entities that have undergone substantial restructuring (see 8.5.3.A to 8.5.3.C below).

- *The length of time the entity's shares have been publicly traded*

  A newly listed entity might have a high historical volatility, compared with similar entities that have been listed longer. Further guidance for newly listed entities is given in 8.5.3.A below.

- *'Mean-reverting tendency'*

  This refers to the tendency of volatility to revert to its long-term average level, and other factors indicating that expected future volatility might differ from past volatility. For example, if an entity's share price was extraordinarily volatile for some identifiable period of time because of a failed takeover bid or a major restructuring, that period could be disregarded in computing historical average annual volatility. However, an entity should not exclude general economic factors such as the effect of an economic downturn on share price volatility.

- *Appropriate and regular intervals for price observations*

  The price observations should be consistent from period to period. For example, an entity might use the closing price for each week or the opening price for the week, but it should not use the closing price for some weeks and the opening price for other weeks. Also, the price observations should be expressed in the same currency as the exercise price. In our view, at least thirty observations are generally required to calculate a statistically valid standard deviation. Our experience has been that, in general, it is more appropriate to make such observations daily or weekly rather than monthly.

8.5.3.A Newly listed entities

As noted under 'Historical volatility' at 8.5.3 above, an entity should consider the historical volatility of the share price over the most recent period that is generally commensurate with the expected option term. If a newly listed entity does not have sufficient information on historical volatility, it should compute historical volatility for the longest period for which trading activity is available. It should also consider the historical volatility of similar entities. For example, an entity that has been listed for only one year and grants options with an average expected life of five years might consider the historical volatility of entities in the same industry, which are of a similar size and operate similar businesses, for the first six years in which the shares of those entities were publicly traded. *[IFRS 2.B26]*.

8.5.3.B Unlisted entities

An unlisted entity will have neither historical nor current market information to consider when estimating expected volatility. IFRS 2 suggests that, in some cases, an unlisted entity that regularly issues options or shares might have set up an internal market for its shares. The volatility of those share prices could be considered when estimating expected volatility. Alternatively, if the entity has based the value of its shares on the share prices of similar listed entities, the entity could consider the historical or implied volatility of the shares of those similar listed entities. *[IFRS 2.B27-29]*.

If the entity has not used a valuation methodology based on the share prices of similar listed entities, the entity could derive an estimate of expected volatility consistent with the valuation methodology used. For example, the entity might consider it appropriate to value its shares on a net asset or earnings basis if this approximates to the fair value of the equity instruments, in which case it could consider the expected volatility of those net asset values or earnings. *[IFRS 2.B30]*.

8.5.3.C Listed entities that have undergone significant restructuring

An issue not specifically addressed by IFRS 2 is the approach required in the case of an entity that has been listed for some time but which has recently undergone significant restructuring or refocusing of the business (e.g. as a result of acquisitions, disposals or refinancing). In such cases, it may well be appropriate to adopt the approach advocated for newly listed entities in 8.5.3.A above.

8.5.3.D Expected volatility under the Black-Scholes-Merton formula

In calculating the fair value of a share option using the Black-Scholes-Merton formula, a single expected volatility assumption must be used. That amount should be based on the volatility expected over the expected term of the option. Frequently, expected volatility is based on observed historical share price volatility during the period of time equal to the expected term of the option and ending on the grant date. Implied volatilities (i.e. volatilities implied by actual option prices on the entity's shares observed in the market) also may be considered in determining the expected volatility assumption (see 8.5.3 above).

When developing an expected volatility assumption, current and historical implied volatilities for publicly traded options and historical realised share volatilities should be considered for shares of the grantor and shares of other entities in the grantor's industry and comparable entities.

The volatility of a market index will not generally provide an appropriate input as the diversified nature of the index tends to produce a lower volatility figure than that applicable to individual shares.

8.5.3.E Expected volatility under lattice models

Expected volatility is more accurately taken into account by lattice models than by the Black-Scholes-Merton formula, because lattice models can accommodate dynamic assumptions regarding the term structure and path-dependence of volatility. For example, there is evidence that volatility during the life of an option depends on the term of the option and, in particular, that short-term options often exhibit higher volatility than similar options with longer terms. Additionally, volatility is path-dependent, in that it is often lower (higher) after an increase (decrease) in share price.

An entity that can observe sufficiently extensive trading of options over its shares may decide, when developing a term structure of expected volatility, to place greater weight on current implied volatilities than on historical observed and implied volatilities. It is likely that current implied volatilities are better indicators of the expectations of market participants about future volatility.

8.5.4 Expected dividends

The valuation of an award of options depends on whether or not the holder is entitled to dividends or dividend equivalents (whether in the form of cash payments or reductions in the exercise price) before the award is ultimately exercised. *[IFRS 2.B31-32, B34]*. The accounting treatment of awards that entitle the holder to dividends before exercise is discussed further at 15.3 below.

Dividends paid on the underlying share will impact the share option value – the higher the expected dividend yield (i.e. dividend per share ÷ share price), the lower the option value. Option holders generally do not have dividend rights until they actually exercise the options and become shareholders. All other things being equal, a share option for a share yielding a high dividend is less valuable than one for a share yielding a low dividend.

Where employees are entitled to dividends or dividend equivalents, the options granted should be valued as if no dividends will be paid on the underlying shares, so that the input for expected dividends (which would otherwise reduce the valuation of an option) is zero. Conversely, where employees are not entitled to dividends or dividend equivalents, the expected dividends should be included in the application of the pricing model. *[IFRS 2.B31-32, B34]*.

While option pricing models generally call for an expected dividend yield, they may be modified to use an expected dividend amount rather than a yield. Where an entity uses expected payments rather than expected yields, it should consider its historical pattern of increases in dividends. For example, if an entity's policy has generally been to increase dividends, its estimated option value should not assume a fixed dividend amount throughout the life of the option unless there is evidence to support that assumption. *[IFRS 2.B35]*.

Determination of the expected dividends over the expected term of the option requires judgement. Generally, the expected dividend assumption should be based on current expectations about an entity's anticipated dividend policy. For example, an entity that has demonstrated a stable dividend yield in past years, and has indicated no foreseeable plans to change its dividend policy, may simply use its historical dividend yield to estimate the fair value of its options. If an entity has never paid a dividend, but has publicly announced that it will begin paying a dividend yielding 2% of the current share price, it is likely that an expected dividend yield of 2% would be assumed in estimating the fair value of its options.

Generally, assumptions about expected dividends should be based on publicly available information. Thus, an entity that does not pay dividends and has no plans to do so should assume an expected dividend yield of zero. However, an emerging entity with no history of paying dividends might expect to begin paying dividends during the expected lives of its employee share options. Such entities could use an average of their past dividend yield (zero) and the mean dividend yield of a comparable peer group of entities. *[IFRS 2.B36]*.

8.5.4.A Expected dividends under the Black-Scholes-Merton formula

Closed-form option-pricing models generally call for a single expected dividend yield as an input. That input should be determined based on the guidance at 8.5.4 above.

8.5.4.B Expected dividends under the binomial model and other lattice models

Lattice models can be adapted to use an expected dividend amount rather than a dividend yield, and therefore can also take into account the impact of anticipated dividend changes. Such approaches might better reflect expected future dividends, since dividends do not always move in a fixed fashion with changes in the entity's share price. This may be a time- or price-dependent assumption, similar to those described in the discussion of the binomial model at 8.3.2 above. Expected dividend estimates in a lattice model should be determined based on the general guidance above. Additionally, when the present value of dividends becomes significant in relation to the share price, standard lattice models may need to be amended.

8.5.5 Risk-free interest rate

Typically, the risk-free interest rate is the implied yield currently available on zero-coupon government issues of the country in whose currency the exercise price is expressed, with a remaining term equal to the expected term of the option being valued (based on the remaining contractual life of the option and taking into account the effects of expected early exercise). It may be necessary to use an appropriate substitute, if no such government issues exist, or where the implied yield on zero-coupon government issues may not be representative of the risk-free interest rate (for example, in high inflation economies). An appropriate substitute should also be used if market participants would typically determine the risk-free interest rate by using that substitute. *[IFRS 2.B37]*.

The risk-free interest rate will not have an impact on most free share grants unless the counterparty is not entitled to dividends during the vesting period and the fair value of the grant has been reduced by the present value of the dividends. Otherwise, grants of free shares have an exercise price of zero and therefore involve no cash outflow for the holder.

8.5.5.A Risk-free interest rate under the Black-Scholes-Merton formula

The Black-Scholes-Merton formula expressed at 8.3.1 above uses a continuously compounded interest rate, which means that any interest rate calculated or obtained needs to be in this format. The continuously compounded interest rate is given by the formula:

continuously compounding rate = ln(1 + annual rate),

where ln represents a natural logarithm. For example, a 1.50% annual effective rate results in a continuously compounded rate of 1.49%:

1.49% = ln(1 + 0.0150)

8.5.5.B Risk-free interest rate under binomial and other lattice models

At each node in the lattice, the option values in the lattice should be discounted using an appropriate forward rate as determined by a yield curve constructed from the implied yield on zero-coupon government bond issues. In stable economies this will have minimal impact and it is therefore likely that a flat risk-free rate that is consistent with the expected life assumption will be a reasonable estimate for this input.

8.6 Capital structure effects and dilution

Typically, traded share options are written by third parties, not the entity issuing the shares that are the subject of the option. When these share options are exercised, the writer delivers to the option holder shares acquired from existing shareholders. Hence the exercise of traded share options has no dilutive effect. By contrast, when equity-settled share options written by the entity are exercised, new shares may be issued (either in form or in substance, if shares previously repurchased and held in treasury are used), giving rise to dilution. This actual or potential dilution may reduce the share price, so that the option holder does not make as large a gain on exercise as would be the case on exercising an otherwise similar traded option that does not dilute the share price. *[IFRS 2.B38-39]*.

Whether or not this has a significant effect on the value of the share options granted depends on various factors, such as the number of new shares that will be issued on exercise of the options compared with the number of shares already issued. Also, if the market already expects that the option grant will take place, the market may have already factored the potential dilution into the share price at the date of grant. However, the entity should consider whether the possible dilutive effect of the future exercise of the share options granted might have an impact on their estimated fair value at grant date. Option pricing models can be adapted to take into account this potential dilutive effect. *[IFRS 2.B40-41]*.

In practice, in our view, it is unlikely that a listed entity would be required to make such an adjustment unless it makes a very large, unanticipated grant of share options. Indeed, even in that case, if the potential dilution is material and is not already incorporated into the share price, it would be expected that the announcement of the grant would cause the share price to decline by a material amount. Unlisted entities should consider whether the dilutive impact of a very large option grant is already incorporated into the estimated share price used in their option-pricing model. If that is not the case, some adjustment to the fair value may be appropriate.

8.7 Valuation of equity-settled awards other than options

As noted at 8.1 above, the discussion in 8.3 to 8.5 above may well be relevant to share-based payments other than options. These include, but are not restricted to:

- awards of shares (see 8.7.1 below);
- non-recourse loans (see 8.7.2 below);
- share appreciation rights (SARs) (see 8.7.3 below); and
- performance rights (see 8.7.4 below).

8.7.1 Shares

IFRS 2 requires shares granted to employees to be valued at their market price (where one exists) or an estimated market value (where the shares are not publicly traded), in either case adjusted to take account of the terms and conditions on which the shares were granted, other than those vesting conditions that IFRS 2 requires to be excluded in determining the grant date fair value (see 6.2 above). *[IFRS 2.B2]*.

For example, the valuation should take account of restrictions on the employee's right:

- to receive dividends in the vesting period (see below); or
- to transfer shares after vesting, but only to the extent that such restrictions would affect the price that a knowledgeable and willing market participant would pay for the shares. Where the shares are traded in a deep and liquid market, the effect may be negligible.

The valuation should not, however, take account of restrictions on transfer or other restrictions that exist during the vesting period and which stem from the existence of vesting conditions. *[IFRS 2.B3]*.

Whether dividends should be taken into account in measuring the fair value of shares depends on whether the counterparty is entitled to dividends or dividend equivalents (which might be paid in cash) during the vesting period. When the grant date fair value of shares granted to employees is estimated, no adjustment is required if the employees are entitled to receive dividends during the vesting period (as they are in no different a position in this respect than if they already held shares). However, where employees are not entitled to receive dividends during the vesting period, the valuation should be reduced by the present value of dividends expected to be paid during the vesting period. *[IFRS 2.B31, B33-34]*. The basis on which expected dividends during the vesting period might be determined is discussed in the context of the impact of expected dividends on the fair value of share options at 8.5.4 above.

The accounting treatment of awards which give the right to receive dividends or dividend equivalents during the vesting period is discussed further at 15.3 below.

8.7.2 Non-recourse loans

Non-recourse loans are loans granted by an entity to the employee to allow the employee to buy shares, and are discussed in more detail at 15.2 below. Generally, however, the loan is interest-free, with the dividends received on the purchased shares being used to repay the loan. The loan acts like an option, in that, at the point in time when the holder decides to sell the shares to repay the loan, if the shares are worth less than the loan, the remaining part of the loan is forgiven, with the effect that, just as in the case of an option, the holder bears no risk of ownership.

8.7.3 Share appreciation rights (SARs)

A share appreciation right (SAR) is a grant whereby the employee will become entitled either to shares or, more commonly, to a future cash payment based on the increase in the entity's share price from a specified level over a period of time (see further discussion at 9 below on cash-settled awards). This essentially has the same payoff as a call option, except the award is generally cash- rather than equity-settled.

8.7.4 Performance rights

A performance right is the right to acquire further shares after vesting, upon certain criteria being met. These criteria may include certain performance conditions which can usually be modelled with either a Black-Scholes-Merton formula or a binomial lattice model or a Monte Carlo Simulation depending on the nature of the conditions attached to the rights. Such awards may be structured as matching share awards, as discussed in more detail at 15.1 below.

8.8 Awards whose fair value cannot be measured reliably

IFRS 2 acknowledges that there may be rare cases where it is not possible to determine the fair value of equity instruments granted. In such cases, the entity is required to adopt a method of accounting based on the intrinsic value of the award (i.e. the price of the underlying share less the exercise price, if any, for the award). This is slightly puzzling in the sense that, for unlisted entities, a significant obstacle to determining a reliable fair value for equity instruments is the absence of a market share price, which is also a key input in determining intrinsic value. In fact, the intrinsic value model is arguably more onerous than the fair value model since, as discussed further in 8.8.1 and 8.8.2 below, it requires intrinsic value to be determined not just once, but at initial measurement date and each subsequent reporting date until exercise.

8.8.1 Intrinsic value method – the basic accounting treatment

Under the intrinsic value method:

(a) the entity measures the intrinsic value of the award at each reporting date between grant date and settlement (whether through exercise, forfeiture or lapse);

(b) at each reporting date during the vesting period the cumulative expense should be determined as the intrinsic value of the award at that date multiplied by the expired portion of the vesting period, with all changes in the cumulative expense recognised in profit or loss; and

(c) once options have vested, all changes in their intrinsic value until settlement should be recognised in profit or loss. *[IFRS 2.24(a)]*.

The cumulative expense during the vesting period, like that for awards measured at fair value, should always be based on the best estimate of the number of awards that will actually vest (see 6 above). However, the distinction between market vesting conditions, non-market vesting conditions and non-vesting conditions that would apply to equity-settled awards measured at fair value (see 6.1 to 6.4 above) does not apply in the case of awards measured at intrinsic value. *[IFRS 2.24(b)].* In other words, where an award measured at intrinsic value is subject to a market condition or non-vesting condition that is not met, there is ultimately no accounting expense for that award. This is consistent with a model requiring constant remeasurement.

The cost of awards measured at intrinsic value is ultimately revised to reflect the number of awards that are actually exercised. However, during the vesting period the cost should be based on the number of awards estimated to vest and thereafter on the number of awards that have vested. In other words, any post-vesting forfeiture or lapse should not be anticipated, but should be accounted for as it occurs. *[IFRS 2.24(b)].*

Example 34.34 is based on IG Example 10 in the implementation guidance to IFRS 2 and illustrates the intrinsic value method. *[IFRS 2 IG Example 10].*

Example 34.34: Intrinsic value method

At the beginning of year 1, an entity grants 1,000 share options to 50 employees.

The share options will vest at the end of year 3, provided the employees remain in service until then. The options can be exercised at the end of year 4, and then at the end of each subsequent year up to and including year 10. The exercise price, and the entity's grant date share price, is €60. At the date of grant, the entity concludes that it cannot estimate reliably the fair value of the share options granted.

At the end of year 1, the entity estimates that 10 of the employees will have left employment by the end of the vesting period and so 80% of the share options will vest. At the end of year 2, the entity revises the number of leavers to 7 and its estimate of the number of share options that it expects will vest to 86%.

During the vesting period, a total of 7 employees leave, so that 43,000 share options vest.

The intrinsic value of the options, and the number of share options exercised during years 4-10, are as follows:

Year	Share price at year end €	Intrinsic value €	Number exercised at year end
1	63	3	
2	65	5	
3	75	15	
4	88	28	6,000
5	100	40	8,000
6	90	30	5,000
7	96	36	9,000
8	105	45	8,000
9	108	48	5,000
10	115	55	2,000

The expense recognised under IFRS 2 will be as follows. In the period up to vesting the 'cumulative expense' methodology used in the examples at 6.1 to 6.4 above can be adopted to derive the expense for each period:

Year	Calculation of cumulative expense	Cumulative expense (€)	Expense for period (€)
1	50,000 options × €3 × 80% × 1/3	40,000	40,000
2	50,000 options × €5 × 86% × 2/3	143,333	103,333
3	43,000 options × €15	645,000	501,677

In years 4 to 10 it is more straightforward to calculate the expense directly. Since all options exercised during each year are exercised at the end of that year, the annual expense can be calculated as the change in intrinsic value during each year of the options outstanding at the start of the year.

Year		Expense for period (€)
4	43,000 options × €(28 – 15)	559,000
5	43,000 – 6,000 = 37,000 options × €(40 – 28)	444,000
6	37,000 – 8,000 = 29,000 options × €(30 – 40)	(290,000)
7	29,000 – 5,000 = 24,000 options × €(36 – 30)	144,000
8	24,000 – 9,000 = 15,000 options × €(45 – 36)	135,000
9	15,000 – 8,000 = 7,000 options × €(48 – 45)	21,000
10	7,000 – 5,000 = 2,000 options × €(55 – 48)	14,000

If, more realistically, the options had been exercisable, and were exercised, at other dates, it would have been necessary to record as an expense for those options the movement in intrinsic value from the start of the year until exercise date. For example, if the 6,000 options in year 4 had been exercised during the year when the intrinsic value was €20, the expense for that period would have been €511,000 comprising €481,000 change in value for the options outstanding at the end of year [37,000 options × €(28 – 15)] and €30,000 change in value of options exercised during the period [6,000 options × €(20 – 15)].

Since the intrinsic value method will initially be applied at the date at which the entity obtains the goods or the counterparty renders service and continues to be applied at the end of each reporting period until the date of final settlement, in our view the entity should continue to apply this method of measurement throughout the life of such an award even if it becomes possible to measure the fair value of the award at some stage prior to its settlement.

8.8.2 Modification, cancellation and settlement

The methodology of the intrinsic value method has the effect that modification or cancellation is dealt with automatically, and the rules for modification and cancellation of awards measured at fair value (see 7 above) therefore do not apply. *[IFRS 2.25]*.

Where an award accounted for at intrinsic value is settled in cash, the following provisions apply, which are broadly similar to the rules for settlement of awards accounted for at fair value.

If settlement occurs before vesting, the entity must treat this as an acceleration of vesting and 'recognise immediately the amount that would otherwise have been recognised for services received over the remainder of the vesting period'. *[IFRS 2.25(a)]*. The wording here is the same as that applicable to settlement of awards accounted for at fair value, which we discuss in more detail at 7.4.3 above.

Any payment made on settlement must be deducted from equity, except to the extent that it is greater than the intrinsic value of the award at settlement date. Any such excess is accounted for as an expense. *[IFRS 2.25(b)]*.

8.9 Awards with reload features

Some share options contain a reload feature (see 5.5.1 above). Reloads commonly provide that, where an exercise price is satisfied in shares of the issuing entity rather than cash, there is a new grant of at-the-money options over as many shares as are equal to the exercise price of the exercised option. For example, if there were 100 options with an exercise price of $10, and the new share price were $15, 67 options (€1,000 ÷ €15) would be re-issued.

Even though the reload feature (i.e. the possibility that additional options would be issued in the future) is a feature of the original option, and can be readily incorporated into the valuation of the original option using a lattice model, the IASB concluded that the fair value of a reload feature should not be incorporated into the estimate of the fair value of the award at grant date. As a result, subsequent grants of reload awards under the reload feature would be accounted for as new awards and measured on their respective grant dates. *[IFRS 2.BC188-192]*.

On the assumption that the exercise price of an award is at least the share price at grant date, the grant-date fair value of the reload award will generally be greater than the incremental value of the reload feature as at the date the original award was granted. This is because the reload award will only be granted if the original option is in-the-money and is exercised. As a result, the award would have increased in the period between the original grant date and the reload grant date, and the higher share price would be used to value the reload grant. However, from the perspective of the aggregate compensation cost, this result is mitigated by the fact that, as the value of the underlying share increases, fewer shares must be tendered to satisfy the exercise price requirement of the exercised option and, therefore, fewer reload options will be granted (as above when only 67 options are re-issued for the 100 originally issued).

If the reload feature were incorporated into the valuation of the original grant, then not only would a lower price be used, but the valuation would consider the possibility that the original option would never be exercised and, therefore, that the reload options would not be granted. Under the approach in IFRS 2, if the original award expires unexercised, no compensation cost results from the reload feature, so that the compensation cost is lower than would be the case if the value of the reload feature were incorporated into the measurement of the original award. Effectively, the approach in IFRS 2 incorporates subsequent share price changes into the valuation of a reload award.

8.10 Awards of equity instruments to a fixed monetary value

Entities may make an award of shares equivalent to a fixed monetary value (see 5.3.5 above). This is commonly found as part of a matching share award where an employee may be offered the choice of receiving cash or shares of an equivalent value, or a multiple of that value (see 15.1 below).

IFRS 2 does not address directly the valuation of such awards. Example 34.35 below illustrates how such awards are valued:

Example 34.35: Award of shares to a fixed monetary value

At the beginning of year 1 the reporting entity grants:

- to Employee A an award of 1,000 shares subject to remaining in employment for three years; and
- to Employee B €10,000 subject to remaining in employment for three years, to be paid in as many shares as are (at the end of year 3) worth €10,000.

Both awards vest, and the share price at the end of year 3 is €10, so that both employees receive 1,000 shares.

The IFRS 2 charge for A's award is clearly 1000 × the fair value as at the beginning of year 1 of a share deliverable in three years' time. What is the charge for B's award?

In our view, the fair value of the equity instruments granted for B's award would be the €10,000 adjusted for the time value of money, as the value employee B will receive is fixed at €10,000 and is independent of the share price. This amount, determined at grant date, would be recognised as an expense over the vesting period, which in this case is a three year service condition for employee B.

Although IFRS 2 does not directly address the valuation of awards of equity instruments equivalent to a fixed monetary value, IFRS 2 does require the grant date fair value of the equity instruments awarded to be recognised, which for a fixed monetary award would be the fixed monetary amount to be received adjusted for the time value of money.

9 CASH-SETTLED TRANSACTIONS

Throughout the discussion in this section, 'cash' should be read as including 'other assets' in accordance with the definition of a cash-settled share-based payment transaction (see 2.2.1 above).

9.1 Scope of requirements

Cash-settled share-based payment transactions include transactions such as:

- share appreciation rights (SARs), where employees are entitled to a cash payment equivalent to the gain that would have arisen from a holding of a particular number of shares from the date of grant to the date of exercise; or
- phantom options, where employees are entitled to a cash payment equivalent to the gain that would have been made by exercising options at a notional price over a notional number of shares and then selling the shares at the date of exercise. *[IFRS 2.31]*.

However, IFRS 2 looks beyond the simple issue of whether an award entitles an employee to receive instruments that are in form shares or options to the terms of those instruments. For example, an award of shares or options over shares whose terms provide for their redemption either mandatorily according to their terms (e.g. on cessation of employment) or at the employee's option would be treated as a cash-settled, not an equity-settled, award under IFRS 2. *[IFRS 2.31]*. This is consistent with the fact that IAS 32 would regard a share with these terms as a financial liability rather than an equity instrument of the issuer (see Chapter 47 at 4).

In some cases the boundary between equity-settled and cash-settled schemes may appear somewhat blurred, so that further analysis may be required to determine whether a particular arrangement is equity-settled or cash-settled. Some examples of such arrangements are discussed at 9.2 below.

9.2 What constitutes a cash-settled award?

There are a number of possible circumstances in which, on, or shortly after, settlement of an equity-settled award either:

- the entity incurs a cash outflow equivalent to that which would arise on cash-settlement (e.g. because it purchases shares in the market at fair value to deliver to counterparties); or

- the counterparty receives a cash inflow equivalent to that which would arise on cash-settlement (e.g. because the shares are sold in the market for cash on behalf of the counterparty).

Such situations raise the question of whether such schemes are in fact truly equity-settled or cash-settled.

Examples of relatively common mechanisms for delivering the cash-equivalent of an equity-settled award to employees are discussed below. It emerges from the analysis below that, in reality, IFRS 2 is driven by questions of form rather than substance. To put it rather crudely, what matters is often not so much whether the entity has made a cash payment for the fair value of the award, but rather the name of the payee.

The significance of this is that the analysis affects the profit or loss charge for the award, as illustrated by Example 34.36 below.

Example 34.36: Equity-settled award satisfied with market purchase of treasury shares

An entity awards an employee a free share with a fair value at grant date of £5 which has a fair value of £8 at vesting. At vesting the entity purchases a share in the market for £8 for delivery to the employee. If the scheme were treated as cash-settled, there would be a charge to profit or loss of £8 (the fair value at vesting date – see 9.3 below). If it were treated as equity-settled (as required in this case by IFRS 2), profit or loss would show a charge of only £5 (the fair value at grant date), with a further net charge of £3 in equity, comprising the £8 paid for the share accounted for as a treasury share (see Chapter 47 at 9) less the £5 credit to equity (being the credit entry corresponding to the £5 charge to profit or loss – see 4.2 above).

The analyses below all rely on a precise construction of the definition of a cash-settled share-based payment transaction, i.e. one 'in which the entity acquires goods or services *by incurring a liability to transfer cash or other assets to the supplier of those goods or services* for amounts that are based on the price (or value) of equity instruments (including shares or share options) of the entity or another group entity' (emphasis added). *[IFRS 2 Appendix A]*. Thus, if the entity is not actually required – legally or constructively – to pay cash to the counterparty, there is no cash-settled transaction under IFRS 2, even though the arrangement may give rise to an external cash flow and, possibly, a liability under another standard.

9.2.1 Formal and informal arrangements for the entity to purchase illiquid shares or otherwise settle in cash (awards to be treated as cash-settled, including unlisted company schemes)

Some share-based payment awards, particularly when made by unlisted entities, might appear to be equity-settled in form but, in our view, may need to be accounted for as cash-settled awards under IFRS 2. This reflects either specific arrangements put in place by the entity (or a shareholder) for the employees to sell their shares or, more generally, the illiquid market in the shares which, in the absence of compelling evidence to the contrary, is likely to result in a cash payment by the entity to the counterparty at some stage. Such awards need to be carefully analysed, in the light of their particular facts and circumstances.

This is similar to the assessment for awards where the agreement states that entities have a choice of settlement in equity or cash (see 10.2.1.A below).

9.2.2 Market purchases of own equity used to satisfy awards

It is common for an entity to choose to settle equity-settled transactions using shares previously purchased in the market rather than by issuing new shares. This does not mean that the transaction is cash-settled, since there is no obligation to deliver cash to the counterparty. *[IFRS 2.B48-49]*.

The purchase of own shares is accounted for in accordance with the provisions of IAS 32 relating to treasury shares and other transactions over own equity (see Chapter 47 at 9).

A question sometimes asked is whether the entity should recognise some form of liability to repurchase its own equity in situations where the entity has a stated policy of settling equity-settled transactions using previously purchased treasury shares. In our view, the normal provisions of IAS 32 apply. For example, a public commitment to settle equity-settled transactions by purchasing treasury shares is no different in substance to a commitment to a share buyback programme. There would be no question under IAS 32 of recognising a liability to repurchase own equity on the basis merely of a declared intention. It is only when the entity enters into a forward contract or a call option with a third party that some accounting recognition of a future share purchase may be required.

9.2.3 Market purchases of own equity following equity-settlement of award

An entity might sometimes make a market purchase of its own shares shortly after issuing a similar number of shares in settlement of an equity-settled transaction. This raises the question of whether such a scheme would be considered as in substance cash-settled.

In our view, further enquiry into the detailed circumstances of the market purchase is required in order to determine the appropriate analysis under IFRS 2.

Broadly speaking, so long as there is no obligation (explicit or implicit) for the entity to settle in cash with the counterparty, such market purchase arrangements will not require a scheme to be treated as cash-settled under IFRS 2. This will be the case even where the entity, as a means of managing the dilutive impact on earnings per share of equity-settlement, routinely buys back shares broadly equivalent to the number issued in settlement.

However, in our view, there might be situations in which post-settlement market share purchases are indicative of an obligation to the counterparty, such that treatment as a cash-settled scheme would be appropriate.

For example, the shares might be quoted in a market which is not very deep, or in which the entity itself is a major participant. If the entity were to create an expectation by employees that any shares awarded can always be liquidated immediately, because the entity will ensure that there is sufficient depth in the market to do so, it could well be appropriate to account for such a scheme as cash-settled. The treatment of schemes in which the entity has a choice of settlement, but has created an expectation of cash-settlement, provides a relevant analogy (see 10.2.1 below).

A more extreme example of such a situation would be where the entity has arranged for the shares delivered to the counterparty to be sold on the counterparty's behalf by a broker (see 9.2.4 below), but has at the same time entered into a contract to purchase those shares from the broker. In that situation, in our view, the substance is that:

- the entity has created an expectation by the counterparty of a right to receive cash; and

- the broker is no more than an agent paying that cash to the counterparty on behalf of the entity.

Accordingly, it would be appropriate to account for such an arrangement as a cash-settled award.

In a situation where the entity had pre-arranged to purchase some, but not all, the shares from the broker, in our view it would generally be appropriate to treat the award as cash-settled only to the extent of the shares subject to the purchase agreement.

9.2.4 Arrangements to sell employees' shares including 'broker settlement'

Many recipients of share awards, particularly employees in lower and middle ranking positions within an entity, do not wish to become long-term investors in the entity and prefer instead to realise any equity-settled awards in cash soon after receipt. In order to facilitate this, the entity may either sell the shares in the market on the employees' behalf or, more likely, arrange for a third party broker to do so.

Such an arrangement (sometimes referred to as 'broker settlement') does not of itself create a cash-settled award, provided that the entity has not created any obligation to provide cash to the employees. If, however, the entity has either created an expectation among employees that it will step in to make good any lack of depth in the market, or has indeed itself contracted to repurchase the shares in question, that may well mean that analysis as a cash-settled scheme is more appropriate (see also 9.2.3 above).

Broker settlement arrangements may raise a general concern that an entity may be masking what are really issues of shares to raise cash to pay its employees as sales of shares on behalf of employees. If an entity were simply to issue shares (or reissue treasury shares) for cash, and then use that cash to pay an employee's salary, the normal accounting treatment for such a transaction would be to credit equity with the proceeds of issue or reissue of shares, and to charge the payment to the employee to profit or loss.

By contrast, a sale of shares on behalf of an employee is undertaken by the entity as agent and does not give rise to an increase in equity and an expense, although an expense will be recognised for the award of shares under IFRS 2. However, the entity may enter into much the same transaction with a broker whether it is selling shares on its own behalf or on behalf of its employees. The challenge is therefore for the entity to be able to demonstrate the true economic nature of the transaction.

For this reason, some take the view that a sale of shares can be regarded as part of a broker settlement arrangement only if the shares are first legally registered in the name of the employee. Whilst we understand the concerns that lie behind this view, we nevertheless question whether legal registration is necessary to demonstrate the substance of a broker settlement arrangement. For example, suppose that 100 shares vest in each of 10 employees who all express a wish that the entity sell the shares on their behalf, and the entity then sells 1,000 treasury shares on behalf of the employees, but without first re-registering title to the shares to the employees. We do not believe that the entity should automatically be precluded from regarding this as a broker settlement arrangement, particularly where the treasury shares are held not by the entity directly but through an employee benefit trust or similar vehicle (see 12.3 below) that is permitted to hold or sell shares only for the benefit of employees.

By contrast, the entity might regularly purchase and sell treasury shares, but identify some of the sales as being undertaken on behalf of employees only after they have occurred. Such an arrangement, in our view, is more difficult to construe as a true broker-settlement arrangement.

Where shares are sold on behalf of an employee, they will typically attract transaction costs, such as brokerage fees or taxes. If such costs are borne by the entity, they should, in our view, be included within profit or loss as an additional component of employment costs, rather than deducted from equity as a cost of a transaction in own shares.

This highlights a commercial disadvantage of broker settlement arrangements. The entity may have to:

- purchase shares in the market (incurring transaction costs) on behalf of an employee who does not want them and then sell them back into the market on the employee's behalf (incurring more transaction costs); or
- sell shares in the market (incurring transaction costs) on behalf of an employee who does not want them and then buy them back in the market on behalf of another employee who does want them (incurring more transaction costs).

In order to avoid this, entities may try to structure arrangements with their brokers involving back-to-back sale and purchase contracts, under which shares are never physically delivered, but the entity makes a cash payment to the broker in purported settlement of the purchase by the broker of shares on behalf of the entity and the broker passes it on to the employee in purported settlement of the sale of the shares by the broker on behalf of the employee.

In our view, such arrangements cannot be seen as equity-settled transactions with broker settlement, but must be regarded as cash-settled share-based payment transactions, using the broker as paying agent.

Related issues are raised by the 'drag along' and 'tag along' rights that are often a feature of awards designed to reward employees for a successful flotation or other exit event (see 15.4.6 below).

9.3 Cash-settled transactions: required accounting

9.3.1 Basic accounting treatment

It is clear that the ultimate cost of a cash-settled transaction must be the actual cash paid to the counterparty, which will be the fair value at settlement date. Moreover, the cumulative cost recognised until settlement is clearly a liability, not a component of equity.

The liability is recognised and measured as follows:

- at each reporting date between grant and settlement the fair value of the award is determined in accordance with the specific requirements of IFRS 2;
- during the vesting period, the liability recognised at each reporting date is the IFRS 2 fair value of the award at that date multiplied by the expired portion of the vesting period; and
- from the end of the vesting period until settlement, the liability recognised is the full fair value of the liability at the reporting date.

All changes in the liability are recognised in profit or loss for the period. *[IFRS 2.30-33D, IG Example 12, IG Example 12A]*. Where the cost of services received in a cash-settled transaction is recognised in the carrying amount of an asset (e.g. inventory) in the entity's statement of financial position, the carrying amount of the asset is not adjusted for changes in the fair value of the liability. *[IFRS 2.IG19]*.

The fair value of the liability should be determined, initially and at each reporting date until it is settled, by applying an option pricing model, taking into account the terms and conditions on which the cash-settled transaction was granted, and the extent to which the employees have rendered service to date. *[IFRS 2.33]*. Determination of fair value is subject to the requirements of paragraphs 33A to 33D of IFRS 2, these paragraphs clarify the treatment of vesting and non-vesting conditions and are discussed further at 9.3.2 below. *[IFRS 2.33]*.

This has the effect that, although the liability will ultimately be settled at its then intrinsic value, its measurement at reporting dates before settlement is based on its fair value. Before the initial publication of IFRS 2, a number of respondents to the IASB's earlier exposure draft suggested that, for reasons of consistency and simplicity of calculation, cash-settled transactions should be measured at intrinsic value throughout their entire life. The IASB, while accepting these merits of the intrinsic value approach, rejected it on the basis that, since it does not include a time value, it is not an adequate measure of either the liability or the cost of services consumed. *[IFRS 2.BC246-251]*.

As noted at 5.5 above, the approach to determining the fair value of share-based payments continues to be that specified in IFRS 2 as share-based payments fall outside the scope of IFRS 13 which applies more generally to the measurement of fair value under IFRSs (see Chapter 14). *[IFRS 2.6A]*.

IFRS 2 uses the term 'share appreciation rights' when referring to measurement of the liability but makes clear that this should be read as including any cash-settled share-based payment transaction. *[IFRS 2.31]*.

9.3.2 Application of the accounting treatment

The treatment required by IFRS 2 for cash-settled transactions is illustrated by Example 34.37 below and by Example 34.38 at 9.3.2.C below. These examples are based, respectively, on IG Examples 12 and 12A in the implementation guidance accompanying IFRS 2. *[IFRS 2 IG Example 12, IG Example 12A]*.

Example 34.37: Cash-settled transaction with service condition

An entity grants 100 cash-settled share appreciation rights (SARs) to each of its 500 employees, on condition that the employees remain in its employment for the next three years. The SARs can be exercised on the third, fourth and fifth anniversary of the grant date.

During year 1, 35 employees leave. The entity estimates that a further 60 will leave during years 2 and 3 (i.e. the award will vest in 405 employees).

During year 2, 40 employees leave and the entity estimates that a further 25 will leave during year 3 (i.e. the award will vest in 400 employees).

During year 3, 22 employees leave, so that the award vests in 403 employees. At the end of year 3, 150 employees exercise their SARs (leaving 253 employees still to exercise).

Another 140 employees exercise their SARs at the end of year 4, leaving 113 employees still to exercise, who do so at the end of year 5.

The entity estimates the fair value of the SARs at the end of each year in which a liability exists as shown below. The intrinsic values of the SARs at the date of exercise (which equal the cash paid out) at the end of years 3, 4 and 5 are also shown below.

Year	Fair value £	Intrinsic value £
1	14.40	
2	15.50	
3	18.20	15.00
4	21.40	20.00
5		25.00

The entity will recognise the cost of this award as follows:

Year	Calculation of liability	Calculation of cash paid	Liability (£)	Cash paid (£)	Expense for period (£)*
1	405 employees × 100 SARs × £14.40 × 1/3		194,400	–	194,400
2	400 employees × 100 SARs × £15.50 × 2/3		413,333	–	218,933
3	253 employees × 100 SARs × £18.20	150 employees × 100 SARs × £15.00	460,460	225,000	272,127
4	113 employees × 100 SARs × £21.40	140 employees × 100 SARs × £20.00	241,820	280,000	61,360
5	–	113 employees × 100 SARs × £25.00	–	282,500	40,680

* Liability at end of period + cash paid in period – liability at start of period

The accounting treatment for cash-settled transactions is therefore (despite some similarities in the methodology) significantly different from that for equity-settled transactions. An important practical issue is that, for a cash-settled transaction, the entity must determine the fair value at each reporting date and not merely at grant date (and at the date of any subsequent modification or settlement) as would be the case for equity-settled transactions.

As Example 34.37 shows, it is not generally necessary, although arguably required by IFRS 2, to determine the fair value of a cash-settled transaction at grant date, at least to determine the expense under IFRS 2. However, for entities subject to IAS 33 – *Earnings per Share* – the grant date fair value may be required in order to make the disclosures required by that standard – see Chapter 37 at 6.4.2.

We discuss in more detail at 9.3.2.A to 9.3.2.E below the following aspects of the accounting treatment of cash-settled transactions:

- determining the vesting period (see 9.3.2.A below);
- periodic allocation of cost (see 9.3.2.B below);
- treatment of non-market vesting conditions (see 9.3.2.C below);
- treatment of market conditions and non-vesting conditions (see 9.3.2.D below); and
- treatment of modification, cancellation and settlement (see 9.3.2.E below).

9.3.2.A Determining the vesting period

The rules for determining vesting periods are the same as those applicable to equity-settled transactions, as discussed in 6.1 to 6.4 above. Where an award vests immediately, IFRS 2 creates a presumption that, in the absence of evidence to the contrary, the award is in respect of services that have already been rendered, and should therefore be expensed in full at grant date. *[IFRS 2.32]*.

Where cash-settled awards are made subject to vesting conditions (as in many cases they will be, particularly where payments to employees are concerned), IFRS 2 creates a presumption that they are a payment for services to be received in the future, during the 'vesting period', with the transaction being recognised during that period, as illustrated in Example 34.37 above. *[IFRS 2.32]*.

9.3.2.B Periodic allocation of cost

IFRS 2 states that the required treatment for cash-settled transactions is simply to measure the fair value of the liability at each reporting date, *[IFRS 2.30]*, which might suggest that the full fair value, and not just a time-apportioned part of it, should be recognised at each reporting date – as would be the case for any liability that is a financial instrument and measured at fair value under IFRS 9.

However, the standard goes on to clarify that the liability is to be measured at an amount that reflects 'the extent to which employees have rendered service to date', and the cost is to be recognised 'as the employees render service'. *[IFRS 2.32-33]*. This, together with IG Examples 12-12A in IFRS 2 (the substance of which is reproduced as Examples 34.37 above and 34.38 below), indicates that a spreading approach is to be adopted.

9.3.2.C Non-market vesting conditions

IFRS 2 clarifies how performance vesting conditions and non-vesting conditions should be treated in the measurement of cash-settled share-based payment transactions. In this section we consider non-market performance conditions; market performance conditions and non-vesting conditions are discussed at 9.3.2.D below.

The standard makes clear that:

- vesting conditions (other than market conditions) should not be taken into account in estimating the fair value of a cash-settled share-based payment. Instead, as for equity-settled share-based payment transactions, such conditions should be taken into account by adjusting the number of awards included in the measurement of the liability arising from the cash-settled share-based payment transaction;
- the amount recognised for the goods or services received during the vesting period should be based on the entity's best estimate of the number of awards expected to vest. This estimate should be revised, if necessary, if subsequent information indicates that the number of awards expected to vest differs from previous estimates. On the vesting date, the entity should revise the estimate to equal the number of awards that ultimately vested; and
- on a cumulative basis, the amount ultimately recognised for goods or services received as consideration for the cash-settled share-based payment will be equal to the cash that is paid. *[IFRS 2.33A-33B, 33D]*.

IG Example 12A of the implementation guidance accompanying IFRS 2 illustrates the accounting treatment of a cash-settled award with a non-market performance condition. *[IFRS 2 IG Example 12A]*. This example forms the basis of Example 34.38 below and supplements the illustration of a service condition in IG Example 12 (broadly reproduced as Example 34.37 above).

Example 34.38: Cash-settled transaction with service condition and non-market performance condition

An entity grants 100 cash-settled share appreciation rights (SARs) to each of its 500 employees, on condition that the employees remain in its employment for the next three years and the entity reaches a revenue target (£1 billion in sales) by the end of year 3. The entity expects all employees to remain in employment for the full three years.

At the end of year 1, the entity expects that the revenue target will not be achieved by the end of year 3. During year 2, the entity's revenue increased significantly and it is expected that the revenue will continue to grow. Consequently, at the end of year 2, the entity expects that the revenue target will be achieved by the end of year 3.

At the end of year 3, the revenue target is achieved and 150 employees exercise their SARs. Another 150 employees exercise their SARs at the end of year 4 and the remaining 200 exercise their SARs at the end of year 5.

Using an option pricing model, the entity estimates the fair value of the SARs, ignoring the revenue target performance condition and the employment service condition, at the end of each year until all of the cash-settled share-based payments are settled. At the end of year 3, all of the SARs vest. The following table shows the estimated fair value of the SARs at the end of each year and the intrinsic values of the SARs at the date of exercise (which equal the cash paid out).

Year	Fair value £	Intrinsic value £
1	14.40	
2	15.50	
3	18.20	15.00
4	21.40	20.00
5	25.00	25.00

The entity will recognise a total expense and cash payment of £1,025,000 as follows:

Year	Calculation of liability	Calculation of cash paid	Liability (£)	Cash paid (£)	Expense for period (£)*
1	SARs are not expected to vest: no expense is recognised.		–	–	–
2	SARs are expected to vest: 500 employees × 100 SARs × £15.50 × 2/3		516,667	–	516,667
3	((500 – 150) employees × 100 SARs × £18.20 × 3/3) – 516,667	150 employees × 100 SARs × £15.00	637,000	225,000	345,333
4	((350 – 150) employees × 100 SARs × £21.40) – 637,000	150 employees × 100 SARs × £20.00	428,000	300,000	91,000
5	((200 – 200) employees × 100 SARs × £25.00) – 428,000	200 employees × 100 SARs × £25.00	–	500,000	72,000

* Liability at end of period + cash paid in period – liability at start of period

9.3.2.D Market conditions and non-vesting conditions

IFRS 2 clarifies that market conditions and non-vesting conditions should be taken into account when estimating the fair value of a cash-settled share-based payment when it is initially measured and at each remeasurement date until settlement. *[IFRS 2.33C]*. There will be no ultimate cost for a cash-settled award where a market condition or non-vesting condition is not satisfied as any liability would be reversed. The cumulative amount recognised will be equal to the cash paid. *[IFRS 2.33D]*. This is different from the accounting model for equity-settled transactions with market conditions or non-vesting conditions, which can result in a cost being recognised for awards subject to a market or non-vesting condition that is not satisfied (see 6.3 and 6.4 above).

9.3.2.E Modification, cancellation and settlement

IFRS 2 includes guidance for modifications that change the classification of a share-based payment transaction from cash-settled to equity-settled (see 9.4 below). Apart from this, IFRS 2 provides no specific guidance on modification, cancellation and settlement of cash-settled awards. However, as cash-settled awards are accounted for using a full fair value model no such guidance is needed. It is clear that:

- where an award is modified, the liability recognised at and after the point of modification will be based on its new fair value, with the effect of any movement in the liability recognised immediately;
- where an award is cancelled the liability will be derecognised, with a credit immediately recognised in profit or loss; and
- where an award is settled, the liability will be derecognised, and any gain or loss on settlement immediately recognised in profit or loss.

9.4 Modification of award from equity-settled to cash-settled or from cash-settled to equity-settled

An entity will sometimes modify the terms of an award in order to change the manner of settlement. In other words, an award that at grant date was equity-settled is modified so as to become cash-settled, or *vice versa*.

IFRS 2 provides no explicit guidance for modifications that change an award from being equity-settled to being cash-settled. As part of the discussions relating to the June 2016 amended guidance for modifications from cash-settled to equity-settled, the IASB considered, but rejected, suggestions that additional examples be added to the implementation guidance to illustrate other types of modification, including equity-settled to cash-settled (see further discussion at 9.4.1 below).

In order to develop the suggested accounting approaches discussed at 9.4.1 below we have used the provisions of IFRS 2 in respect of:

- the modification of equity-settled awards during the vesting period (see 7.3 above);
- the addition of a cash-settlement alternative to an equity-settled award after grant date, as illustrated by IG Example 9 in the implementation guidance to IFRS 2 (see 10.1.4 below); and
- the settlement of equity-settled awards in cash (see 7.4 above).

As noted at 10.2.3 below, the accounting in this section also applies where an entity with a choice of settlement in equity or cash switches between settlement methods.

9.4.1 Equity-settled award modified to cash-settled award

This section focuses on accounting for a change of settlement method rather than on the accounting treatment of other modifications to an equity-settled award that might be made at the same time as the change of settlement method (see 7.3 above).

Drawing on the principles within the guidance referred to at 9.4 above, we suggest that entities generally select one of the two approaches discussed below to account for the modification of an award from equity-settled to cash-settled during the vesting period. The first approach is based more closely on the IFRS 2 treatment for the modification of an equity-settled award (see 7.3 above) and the second on that for the repurchase or settlement in cash of an equity instrument (see 7.4 above).

Both approaches take into account IG Example 9 in the implementation guidance to IFRS 2 (see 10.1.4 below) which shows the recognition of an expense when the cash-settlement alternative is remeasured in the period following modification, in addition to an expense for the full grant date fair value of the equity-settled arrangement. Although this Example reflects a choice of settlement by the counterparty, rather than the elimination of a method of settlement (as is the case in a modification from equity-settlement to cash-settlement), we believe that an analogy may be drawn between the two situations because the addition of a cash alternative for the counterparty effectively results in the award being treated as cash-settled from the date of modification.

The two approaches are discussed in more detail below and illustrated in Example 34.39. In our view, either approach is acceptable in the absence of clear guidance in IFRS 2 but the choice of approach should be applied consistently to all such modifications.

Both approaches require the recognition, as a minimum, of an IFRS 2 expense which comprises the following elements:

- the grant date fair value of the original equity-settled award (see 7.3 above); plus
- any incremental fair value arising from the modification of that award (see 7.1 above); plus
- any remeasurement of the liability between its fair value at the modification date and the amount finally settled (see 10.1.4 below).

Over the vesting period as a whole, both approaches result in the same total IFRS 2 expense and the same liability/cash settlement amount. Under both approaches, the net overall difference between the expense and the cash settlement amount is an adjustment to equity. However, the timing of recognition of any incremental fair value arising on modification will differ under the two approaches, as explained below.

Approach 1

- At the date of modification a liability is recognised based on the fair value of the cash-settled award as at that date and the extent to which the vesting period has expired.
- The entire corresponding debit is taken to equity. Any incremental fair value of the cash-settled award over that of the equity-settled award as at the modification date will

be expensed over the period from the date of modification to the date of settlement of the cash-settled award (i.e. no expense is recognised at the date of modification).

- The total fair value of the cash-settled award is remeasured through profit or loss on an ongoing basis between the date of modification and the date of settlement.

As Approach 1 is based on the accounting treatment for a modification of an equity-settled award, no incremental fair value is recognised as an expense at the modification date. This means that, in cases where the fair value of the modified award is higher at the date of modification than that of the original award, the reduction in equity at the date of modification will be higher than the proportionate fair value at that date of the original equity-settled award. This situation reverses over the remainder of the vesting period when an expense (and corresponding credit to equity) will be recognised for the incremental fair value of the modified award.

Approach 2

- As for Approach 1, at the date of modification a liability is recognised based on the fair value of the cash-settled award as at that date and the extent to which the vesting period has expired.
- Unlike Approach 1, the corresponding debit is taken to equity only to the extent of the fair value of the original equity-settled award as at the date of modification. Any incremental fair value of the cash-settled award over the equity-settled award as at the modification date is expensed immediately on modification to the extent that the vesting period has expired. The remainder of any incremental value is expensed over the period from the date of modification to the date of settlement.
- As for Approach 1, the total fair value of the cash-settled award is remeasured through profit or loss on an ongoing basis between the date of modification and the date of settlement.

Approach 2 is based on the accounting treatment for the repurchase of an equity instrument where a reduction in equity up to the fair value of the equity instrument is recognised as at the date of repurchase with any incremental fair value of the repurchase arrangement being treated as an expense. Whilst Approach 2 avoids the potential problem of an immediate reduction in equity in excess of the fair value of the equity-settled award, its settlement approach could be seen as diverging from the basic IFRS 2 treatment for the modification of an equity-settled award where none of the incremental fair value arising on a modification is expensed at the date of modification.

As noted at the start of this section, the two approaches outlined above are based on the specific principles referred to at 9.4 above. In the absence of clear guidance in the standard, other interpretations of the appropriate expense and equity adjustment are also possible, although these will sometimes result in a higher expense through profit or loss than the two approaches above. For example, in relation to the cash-settled award, the approaches outlined above expense only the difference between the final settlement amount and the full fair value of the liability at the modification date, with the remainder adjusted through equity. An alternative view follows the accounting treatment for cash-settled awards which would lead to the recognition of an expense for the entire remeasurement of the liability from the amount recognised for a part-vested award at modification date to the amount finally settled.

As noted at 9.4 above, the IASB decided that existing implementation guidance in IFRS 2 could be applied by analogy to other types of modification. As an example of this, it states that IG Example 9 illustrates a grant of shares to which a cash settlement alternative is subsequently added. *[IFRS 2.BC237K]*. The approach in IG Example 9 has been considered within our two suggested accounting approaches and is also discussed further in the context of Example 34.39 below.

Example 34.39: Modification of equity-settled award to cash-settled award

A Modified award with same fair value as original award

At the beginning of year 1 an entity granted an equity-settled award, with a fair value at that date of €500, and vesting if the employee is still in service at the end of year 4. At the beginning of year 3, the award is modified so as to become cash-settled, but its terms are otherwise unchanged. The fair value at that date of both alternatives is €150. The liability is actually settled for €180 at the end of year 4.

	Approach 1			Approach 2		
	Expense	Equity	Liability	Expense	Equity	Liability
	€	€	€	€	€	€
Years 1-2	250	(250)	–	250	(250)	–
Modification date (beginning of year 3)	–	75	(75)	–	75	(75)
Years 3-4	280	(175)	(105)	280	(175)	(105)
Totals	530	(350)	(180)	530	(350)	(180)

During years 1 and 2 the entity recognises a cumulative expense of €250, being the proportion of the grant date fair value of the equity-settled award of €500 attributable to 2/4 of the vesting period.

At modification date (beginning of year 3), it is necessary to recognise a liability of €75 (€150 × 2/4 – see 9.3.2 above). The full amount of this liability is recognised as a reduction in equity under both approaches as there is no difference between the fair value of the original and modified awards as at the modification date.

As the award is continuing, there is no acceleration at the modification date of the as yet unrecognised amount of the grant date fair value of the original award (€250, being €500 × 2/4), as would occur in an immediate settlement (see 7.4 above).

During years 3 and 4 (the period from modification to settlement date), the entity recognises an increase of €105 in the fair value of the liability (€180 – €75). During this period it also recognises employee costs totalling €280, being the remaining grant date fair value of €250 (€500 total less €250 expensed prior to modification) plus the post-modification remeasurement of the liability of €30 (€180 – €150). The balance of €175 is credited to equity.

In total the entity recognises an expense of €530, being the original grant date fair value of the equity-settled award of €500 plus the post-modification remeasurement of the liability of €30. This adjustment of €30 is consistent with the approach taken in IG Example 9 in the implementation guidance to IFRS 2 (see 10.1.4 and Example 34.42 below).

In Scenario A the modification date fair value is lower than the grant date fair value. Scenario E below considers a situation where the awards have the same fair value as at the date of modification but this fair value is higher than the original grant date fair value of the equity-settled award.

B Modified award with greater fair value than original award

At the beginning of year 1 an entity granted an equity-settled award, with a fair value at that date of €500, and vesting if the employee is still in service at the end of year 4. At the beginning of year 3, the award is modified so as to become cash-settled, with other modifications meaning that the new award has a higher fair value than the original award. At that date, the fair value of the original award is €150, but that of the cash-settled replacement award is €170. The liability is actually settled for €200 at the end of year 4.

	Approach 1			Approach 2		
	Expense	Equity	Liability	Expense	Equity	Liability
	€	€	€	€	€	€
Years 1-2	250	(250)	–	250	(250)	–
Modification date (beginning of year 3)	–	85	(85)	10	75	(85)
Years 3-4	300	(185)	(115)	290	(175)	(115)
Totals	550	(350)	(200)	550	(350)	(200)

During years 1 and 2 the entity recognises a cumulative expense of €250, being the proportion of the grant date fair value of the equity-settled award of €500 attributable to 2/4 of the vesting period.

At modification date (beginning of year 3), it is necessary to recognise a liability of €85 (€170 × 2/4 – see 9.3.2 above). Under Approach 1 the difference between the fair value of the original equity-settled award and the modified award (€20 in total) is not recognised immediately as an expense but is spread over the remainder of the vesting period (i.e. starting from the date of modification). The liability of €85 is therefore recognised as a reduction in equity. Under Approach 2, the difference between the fair value of the original equity-settled award and the modified award is expensed immediately to the extent that the vesting period has already expired (€20 × 2/4) with the remainder being expensed in the post-modification period.

As the award is continuing, there is no acceleration at the modification date of the as yet unrecognised amount of the grant date fair value of the original award (€250, being €500 × 2/4) as would occur in an immediate settlement (see 7.4 above).

During years 3 and 4 (the period from modification to settlement date), the entity recognises an increase of €115 in the fair value of the liability (€200 – €85). During this period, under Approach 1 it also recognises employee costs totalling €300, being the remaining grant date fair value of €250 (€500 total less €250 expensed prior to modification) plus the incremental modification fair value of €20 (€170 – €150) plus the remeasurement of the liability of €30 (€200 – €170) between modification date and settlement date. The balance of €185 is credited to equity. For Approach 2, the expense and the credit to equity during this period are €10 less than under Approach 1 because a proportionate amount of the incremental fair value was expensed immediately at the modification date.

In total the entity recognises an expense of €550, being the original grant date fair value of the equity-settled award of €500 plus the incremental fair value of €20 arising on modification of the award plus the post-modification remeasurement of the liability of €30. This remeasurement adjustment of €30 is consistent with the approach taken in IG Example 9 in the implementation guidance to IFRS 2 (see 10.1.4 and Example 34.42 below).

C Modified award with lower fair value than original award

At the beginning of year 1 an entity granted an equity-settled award, with a fair value at that date of €500, and vesting if the employee is still in service at the end of year 4. At the beginning of year 3, the award is modified so as to become cash-settled, with other modifications meaning that the new award has a lower fair value than the original award. At that date, the fair value of the original award is €150, but that of the cash-settled replacement award is €130. The liability is actually settled for €180 at the end of year 4.

	Approach 1			Approach 2		
	Expense	Equity	Liability	Expense	Equity	Liability
	€	€	€	€	€	€
Years 1-2	250	(250)	–	250	(250)	–
Modification date (beginning of year 3)	–	65	(65)	–	65	(65)
Years 3-4	300	(185)	(115)	300	(185)	(115)
Totals	550	(370)	(180)	550	(370)	(180)

During years 1 and 2 the entity recognises a cumulative expense of €250, being the proportion of the grant date fair value of the equity-settled award of €500 attributable to 2/4 of the vesting period.

At modification date (beginning of year 3), it is necessary to recognise a liability of €65 (€130 × 2/4) (see 9.3.2 above). The full amount of this liability is recognised as a reduction in equity under both approaches as the fair value of the modified award is lower than that of the original award. No gain is recognised for the reduction in fair value consistent with the general principle in IFRS 2 that the cost recognised for an equity-settled award must be at least the grant date fair value of the award.

As the award is continuing, there is no acceleration at the modification date of the as yet unrecognised amount of the grant date fair value of the original award (€250, being €500 × 2/4) as would occur in an immediate settlement (see 7.4 above).

During years 3 and 4 (the period from modification to settlement date), the entity recognises an increase of €115 in the fair value of the liability (€180 – €65). During this period it also recognises employee costs totalling €300, being the remaining grant date fair value of €250 (€500 total less €250 expensed prior to modification) plus the remeasurement of the liability of €50 (€180 – €130) between modification date and settlement date. The balance of €185 is credited to equity.

In total the entity recognises an expense of €550, being the original grant date fair value of the equity-settled award of €500 plus the post-modification remeasurement of the liability of €50. This adjustment of €50 is consistent with the approach taken in IG Example 9 in the implementation guidance to IFRS 2 (see 10.1.4 and Example 34.42 below).

Whilst the overall liability in Scenario C is the same as that in Scenario A above, the total expense and overall net credit to equity are higher even though the cash-settled award had a lower fair value at the modification date than that in Scenario A. This might appear illogical but is consistent with the approach in IG Example 9 and the requirement to recognise, as a minimum, the grant date fair value of the original equity-settled award together with any post-modification change in the fair value of the liability.

D Modified award with greater fair value than original award but settled for less than modification date fair value

At the beginning of year 1 an entity granted an equity-settled award, with a fair value at that date of €500, and vesting if the employee is still in service at the end of year 4. At the beginning of year 3, the award is modified so as to become cash-settled, with other modifications meaning that the new award has a higher fair value than the original award. At that date, the fair value of the original award is €150, but that of the cash-settled replacement award is €170. The liability is actually settled for €125 at the end of year 4.

	Approach 1			Approach 2		
	Expense	Equity	Liability	Expense	Equity	Liability
	€	€	€	€	€	€
Years 1-2	250	(250)	–	250	(250)	–
Modification date (beginning of year 3)	–	85	(85)	10	75	(85)
Years 3-4	225	(185)	(40)	215	(175)	(40)
Totals	475	(350)	(125)	475	(350)	(125)

During years 1 and 2 the entity recognises a cumulative expense of €250, being the proportion of the grant date fair value of the equity-settled award of €500 attributable to 2/4 of the vesting period.

At modification date (beginning of year 3), it is necessary to recognise a liability of €85 (€170 × 2/4) (see 9.3.2 above). Under Approach 1 the difference between the fair value of the original equity-settled award and the modified award (€20 in total) is not recognised immediately as an expense but is spread over the remainder of the vesting period (i.e. starting from the date of modification). The liability of €85 is therefore recognised as a reduction in equity. Under Approach 2, the difference between the fair value of the original equity-settled award and the modified award is expensed immediately to the extent that the vesting period has already expired (€20 × 2/4) with the remainder being expensed in the post-modification period.

As the award is continuing, there is no acceleration at the modification date of the as yet unrecognised amount of the grant date fair value of the original award (€250, being €500 × 2/4) as would occur in an immediate settlement (see 7.4 above).

During years 3 and 4 (the period from modification to settlement date), the entity recognises an increase of €40 in the fair value of the liability (€125 – €85). During this period, under Approach 1 it also recognises employee costs totalling €225, being the remaining grant date fair value of €250 (€500 total less €250 expensed prior to modification) plus the incremental modification fair value of €20 less a reduction of €45 (€170 – €125) in the fair value of the liability since modification date. The balance of €185 is credited to equity. For Approach 2, the expense and the credit to equity during this period are €10 less than under Approach 1 because a proportionate amount of the incremental fair value was expensed immediately at the modification date.

In total the entity recognises an expense of €475, being the original grant date fair value of the equity-settled award of €500 plus the incremental fair value of €20 arising on modification of the award less the post-modification remeasurement of the liability of €45. This remeasurement adjustment of €45 is consistent with the approach taken in IG Example 9 in the implementation guidance to IFRS 2 (see 10.1.4 and Example 34.42 below).

E Modified award with same fair value as original award but where modification date fair value is higher than original grant date fair value

At the beginning of year 1 an entity granted an equity-settled award, with a fair value at that date of €500, and vesting if the employee is still in service at the end of year 4. At the beginning of year 3, the award is modified so as to become cash-settled, but its terms are otherwise unchanged. The fair value of the award at that date on both an equity-settled basis and a cash-settled basis is €800. The liability is actually settled for €700 at the end of year 4.

	Approach 1			Approach 2		
	Expense	Equity	Liability	Expense	Equity	Liability
	€	€	€	€	€	€
Years 1-2	250	(250)	–	250	(250)	–
Modification date (beginning of year 3)	–	400	(400)	–	400	(400)
Years 3-4	300	–	(300)	300	–	(300)
Totals	550	150	(700)	550	150	(700)

During years 1 and 2 the entity recognises a cumulative expense of €250, being the proportion of the grant date fair value of the equity-settled award of €500 attributable to 2/4 of the vesting period.

At modification date (beginning of year 3), it is necessary to recognise a liability of €400 (€800 × 2/4 – see 9.3.2 above). The full amount of this liability is recognised as a reduction in equity under both approaches as there is no difference between the fair value of the original and modified awards as at the modification date.

As the award is continuing, there is no acceleration at the modification date of the as yet unrecognised amount of the grant date fair value of the original award (€250, being €500 × 2/4), as would occur in an immediate settlement (see 7.4 above).

During years 3 and 4 (the period from modification to settlement date), the entity recognises a net increase of €300 in the fair value of the liability (€700 – €400). During this period it also recognises employee costs totalling €300, being the remaining modification date fair value of the cash-settled award (€800 × 2/4) plus the post-modification remeasurement of the liability of €(100) (€800 – €700).

In total the entity recognises an expense of €550. This expense reflects three components: firstly, half of the grant date fair value of the original equity-settled award and secondly, half of the modification date fair value of the cash-settled award. As the award had increased in value between grant date and modification date, the requirement of paragraph 27 of IFRS 2 to recognise, as a minimum, the original grant date fair value of the equity-settled award (€250 for the portion of the vesting period prior to modification) has been met. The third component of the overall expense, in accordance with the requirements for cash-settled share-based payments, is the €(100) remeasurement of the liability between modification and settlement. In our view, this is consistent with the approach taken in IG Example 9 in the implementation guidance to IFRS 2 (see 10.1.4 and Example 34.42 below).

Some take the view that the approach in IG Example 9 would lead to a total expense of €400 in the example above, rather than €550 (being the original grant date fair value of €500 plus the remeasurement of the liability of €(100) in the period following the modification). The difference of €150 would be debited to equity in the two years following modification. In other words, in recognising an expense for the cash-settled award during the vesting period after the modification date, no account is taken of the fact that the fair value of the arrangement increased between the original grant date and the modification date.

IG Example 9 illustrates a situation where there is a decrease in the fair value between original grant date and modification date. As a result, that Example expenses the grant date fair value of the original equity-settled award (plus the remeasurement of the liability) in order to meet the minimum expense requirements of paragraph 27 of IFRS 2. In a situation such as that outlined in Scenario E above, it does not seem appropriate, in our view, to limit the post-modification expense for the cash-settled award to an amount based on the original grant date fair value of the equity-settled award (€150) rather than applying cash-settled accounting to the element of the award for which services are delivered in years 3 and 4 and recognising a corresponding expense of €300.

9.4.2 Cash-settled award modified to equity-settled award

IFRS 2 provides guidance in situations where the terms and conditions of a cash-settled award are modified so that it becomes equity-settled. Appendix B to IFRS 2 states that if a cash-settled transaction is modified so that it becomes equity-settled, the transaction will be accounted for as such from the date of the modification and specifically:

- the equity-settled share-based payment transaction is measured by reference to the modification date fair value of the equity instruments granted at that date;
- the equity-settled share-based payment transaction is recognised in equity on the modification date to the extent to which goods or services have been received;
- the liability for the cash-settled share-based payment transaction as at the modification date is derecognised on that date; and
- any difference between the carrying amount of the liability derecognised and the amount recognised in equity on the modification date is recognised immediately in profit or loss. *[IFRS 2.B44A]*.

If the vesting period is extended or shortened as a result of the modification, the modified vesting period is reflected in applying the requirements above. The standard also clarifies that these requirements apply even if the modification takes place after the vesting period. *[IFRS 2.B44B]*.

The standard further clarifies that the above requirements apply if a cash-settled share-based payment is cancelled or settled (other than by forfeiture when vesting conditions are not satisfied) and equity instruments are designated as a replacement for the cancelled or settled share-based payment. In order to qualify as a replacement, the equity instruments must be designated as such on the grant date. *[IFRS 2.B44C]*.

The IASB notes in the Basis for Conclusions that the immediate recognition in profit or loss of any difference between the derecognised liability and the amount recognised in equity is consistent with how cash-settled share-based payments are measured in accordance with paragraph 30 of IFRS 2. It also observes that the approach is consistent with the requirements for the extinguishment of a financial liability (fully or partially by the issue of equity instruments) in IFRS 9 and in IFRIC 19 – *Extinguishing Financial Liabilities with Equity Instruments*. *[IFRS 2.BC237H]*.

IG Example 12C in the implementation guidance of IFRS 2 illustrates the above guidance and forms the basis of Example 34.40 below. *[IFRS 2 IG Example 12C]*.

Example 34.40: Modification of cash-settled award to equity-settled award

At the beginning of year 1 an entity grants 100 cash-settled share appreciation rights (SARs) to each of 100 employees on condition that they remain in the entity's service for four years.

At the end of year 1 each SAR has an estimated fair value of €10 and at the end of year 2 €12.

At the end of year 2 the entity cancels the SARs and, in their place, grants 100 share options to each employee on condition that each remains in service for the next two years, i.e. the original service period is unchanged. At the date of grant, the fair value of each share option is €13.20. All of the employees are expected to meet the service condition.

In years 1 and 2 the entity recognises a cash-settled share-based payment expense of €25,000 and €35,000 respectively, based on the fair value of the SARs at each reporting date and the extent to which the vesting period has been completed. At the modification date, the requirements of paragraph B44A are applied as follows:

		€	€
Modification date (end of year 2)	Equity		66,000
	Liability	60,000	
	Profit or loss	6,000	

The entity compares the fair value of the equity award, measured as at the date of modification, of €66,000 (€132,000 × 2/4) with the fair value of the liability for the cash-settled award of €60,000 (€120,000 × 2/4) at the same date. The difference of €6,000 is recognised immediately in profit or loss.

The remainder of the equity-settled share-based payment, as measured at the modification date, is recognised in profit or loss during years 3 and 4 i.e. an expense of €33,000 in each of the two years.

10 TRANSACTIONS WITH EQUITY AND CASH ALTERNATIVES

It is common for share-based payment transactions (particularly those with employees) to provide either the entity or the counterparty with the choice of settling the transaction either in shares (or other equity instruments) or in cash (or other assets). The general principle of IFRS 2 is that a transaction with a cash alternative, or the components of that transaction, should be accounted for:

(a) as a cash-settled transaction if, and to the extent that, the entity has incurred a liability to settle in cash or other assets; or

(b) as an equity-settled transaction if, and to the extent that, no such liability has been incurred. *[IFRS 2.34]*.

More detailed guidance is provided as to how that general principle should be applied to transactions:

- where the counterparty has choice of settlement (see 10.1 below); and
- where the entity has choice of settlement (see 10.2 below).

Some specific types of arrangement that include cash and equity alternatives, either as a matter of choice or depending on the outcome of certain events are covered elsewhere in this chapter, as outlined below.

A common type of arrangement seen in practice is the 'matching' award or deferred bonus arrangement where an employee is offered a share award or a cash alternative to 'match' a share award or a cash bonus earned during an initial period. This type of arrangement is addressed at 15.1 below.

Rather than providing either the entity or the counterparty with a choice between settlement in equity or in cash, some transactions offer no choice but instead require an arrangement that will generally be equity-settled to be settled in cash in certain specific and limited circumstances (awards with contingent cash settlement). There will also be situations where there is contingent settlement in equity of an award that is otherwise cash-settled. These types of arrangement are considered in more detail at 10.3 below.

Some awards offer an equity alternative and a cash alternative where the cash alternative is not based on the price or value of the equity instruments. These arrangements are considered at 10.4 below.

10.1 Transactions where the counterparty has choice of settlement in equity or in cash

Where the counterparty has the right to elect for settlement in either shares or cash, IFRS 2 regards the transaction as a compound transaction to which split accounting must be applied. The general principle is that the transaction must be analysed into a liability component (the counterparty's right to demand settlement in cash) and an equity component (the counterparty's right to demand settlement in shares). *[IFRS 2.35]*. Once split, the two components are accounted for separately. The methodology of split accounting required by IFRS 2 is somewhat different from that required by IAS 32 for issuers of other compound instruments (see Chapter 47 at 6).

A practical issue is that, where a transaction gives the counterparty a choice of settlement, it will be necessary to establish a fair value for the liability component both at grant date and at each subsequent reporting date until settlement. By contrast, in the case of transactions that can be settled in cash only, a fair value is not generally required at grant date for IFRS 2 accounting purposes, but a fair value is required at each subsequent reporting date until settlement (see 9 above). However, for entities subject to IAS 33, the grant date fair value is required in order to make the disclosures required by that standard – see Chapter 37 at 6.4.2.

We consider in more detail at 10.1.1 to 10.1.3 below the accounting treatment required by IFRS 2 for transactions where the counterparty has a settlement choice. In addition, the following specific situations are discussed:

- the addition of a cash-settlement alternative after the grant date (see 10.1.4 below);
- arrangements where the counterparty is given a choice to cover more or less remote contingencies e.g. restrictions or limits on the issue of shares in a particular jurisdiction (see 10.1.5 below); and
- the issue of convertible bonds in return for goods or services (see 10.1.6 below).

10.1.1 Transactions in which the fair value is measured directly

Transactions with non-employees are normally measured by reference to the fair value of goods and services supplied at service date (i.e. the date at which the goods or services are supplied) – see 4 and 5 above.

Accordingly where an entity enters into such a transaction where the counterparty has choice of settlement, it determines the fair value of the liability component at service date. The equity component is the difference between the fair value (at service date) of the goods or services received and the fair value of the liability component. *[IFRS 2.35]*.

10.1.2 Transactions in which the fair value is measured indirectly – including transactions with employees

All other transactions, including those with employees, are measured by reference to the fair value of the instruments issued at 'measurement date', being grant date in the case of transactions with employees and service date in the case of transactions with non-employees *[IFRS 2 Appendix A]* – see 4.1 and 5.1 above.

The fair value should take into account the terms and conditions on which the rights to cash or equity instruments were issued. *[IFRS 2.36]*. IFRS 2 does not elaborate further on this, but we assume that the IASB intends a reporting entity to apply:

- as regards the equity component of the transaction, the provisions of IFRS 2 relating to the impact of terms and conditions on the valuation of equity-settled transactions (see 4 to 6 above); and
- as regards the liability component of the transaction, the provisions of IFRS 2 relating to the impact of terms and conditions on the valuation of cash-settled transactions (see 9.3 above).

The entity should first measure the fair value of the liability component and then that of the equity component. The fair value of the equity component must be reduced to take into account the fact that the counterparty must forfeit the right to receive cash in order to receive shares. The sum of the two components is the fair value of the whole compound instrument. *[IFRS 2.37]*. IG Example 13 in IFRS 2 (the substance of which is reproduced as Example 34.41 below) suggests that this may be done by establishing the fair value of the equity alternative and subtracting from it the fair value of the liability component. This approach may be appropriate in a straightforward situation involving ordinary shares and cash, as illustrated in the Example in the implementation guidance, but will not necessarily be appropriate in more complex situations that include, for example, the likelihood of options being exercised.

In many share-based payment transactions with a choice of settlement, the value to the counterparty of the share and cash alternatives is equal. The counterparty will have the choice between (say) 1,000 shares or the cash value of 1,000 shares. This will mean that the fair value of the liability component is equal to that of the transaction as a whole, so that the fair value of the equity component is zero. In other words, the transaction is accounted for as if it were a cash-settled transaction.

However, in some jurisdictions it is not uncommon, particularly in transactions with employees, for the equity-settlement alternative to have more value (as in Example 34.41 below). For example, an employee might be able to choose at vesting between the cash value of 1,000 shares immediately or 2,000 shares (often subject to further conditions such as a minimum holding period, or a further service period). In such cases the equity component will have an independent value. *[IFRS 2.37]*. Such schemes are discussed in more detail in Examples 34.63 and 34.64 at 15.1 below.

10.1.3 Accounting treatment

10.1.3.A During vesting period

Having established a fair value for the liability and equity components as set out in 10.1.1 and 10.1.2 above, the entity accounts for the liability component according to the rules for cash-settled transactions (see 9 above) and for the equity component according to the rules for equity-settled transactions (see 4 to 8 above). *[IFRS 2.38]*.

Example 34.41 below illustrates the accounting treatment for a transaction with an employee (as summarised in 10.1.2 above) where the equity component has a fair value independent of the liability component.

Example 34.41: Award with employee choice of settlement with different fair values for cash-settlement and equity-settlement

An entity grants to an employee an award with the right to choose settlement in either:

- 1,000 phantom shares, i.e. a right to a cash payment equal to the value of 1,000 shares; or
- 1,200 shares.

Vesting is conditional upon the completion of three years' service. If the employee chooses the share alternative, the shares must be held for three years after vesting date.

At grant date, the entity estimates that the fair value of the share alternative, after taking into account the effects of the post-vesting transfer restrictions, is €48 per share. The fair value of the cash alternative is estimated as:

	€
Grant date	50
Year 1	52
Year 2	55
Year 3	60

The grant date fair value of the equity alternative is €57,600 (1,200 shares × €48). The grant date fair value of the cash alternative is €50,000 (1,000 phantom shares × €50). Therefore the fair value of the equity component excluding the right to receive cash is €7,600 (€57,600 – €50,000). The entity recognises a cost based on the following amounts.

	Equity component			Liability component		
Year	Calculation of cumulative expense	Cumulative expense (€)	Expense for year (€)	Calculation of cumulative expense	Cumulative expense (€)	Expense for year (€)
1	€7,600 × 1/3	2,533	2,533	1,000 phantoms × €52 × 1/3	17,333	17,333
2	€7,600 × 2/3	5,066	2,533	1,000 phantoms × €55 × 2/3	36,667	19,334
3	€7,600	7,600	2,534	1,000 phantoms × €60	60,000	23,333

This generates the following accounting entries.

	€	€
Year 1		
Profit or loss (employment costs)	19,866	
Liability		17,333
Equity		2,533
	€	€
Year 2		
Profit or loss (employment costs)	21,867	
Liability		19,334
Equity		2,533
Year 3		
Profit or loss (employment costs)	25,867	
Liability		23,333
Equity		2,534

The above Example is based on IG Example 13 in IFRS 2, in which the share price at each reporting date is treated as the fair value of the cash alternative. As discussed more fully at 9 above, the fair value of a cash award is not necessarily exactly the same as the share price as it will depend on the terms and conditions of the award (see 9.3.2 above). Accordingly, in adapting IG Example 13 as Example 34.41 above, we have deliberately described the numbers used in respect of the liability component as 'fair value' and not as the 'share price'. *[IFRS 2 IG Example 13]*.

Example 34.41 also ignores the fact that transactions of this type often have different vesting periods for the two settlement alternatives. For instance, the employee might have been offered:

(a) the cash equivalent of 1,000 shares in three years' time subject to performance conditions; or

(b) subject to the performance criteria in (a) above being met over three years, 3,000 shares after a further two years' service.

IFRS 2 offers no guidance as to how such transactions are to be accounted for. Presumably, however, the equity component would be recognised over a five year period and the liability component over a three year period. This is considered further in the discussion of 'matching' share awards at 15.1 below.

10.1.3.B Settlement

At the date of settlement, the liability component is restated to fair value through profit or loss. If the counterparty elects for settlement in equity, the restated liability is transferred to equity as consideration for the equity instruments issued. If the liability is settled in cash, the cash is obviously applied to reduce the liability. *[IFRS 2.39-40]*. In other words, if the transaction in Example 34.41 above had been settled in shares the accounting entry would have been:

	€	€
Liability*	60,000	
Equity†		60,000

* There is no need to remeasure the liability in this case as it has already been stated at fair value at vesting date, which is the same as settlement date.

† The precise allocation of this amount within equity, and its impact on distributable reserves, will depend on a number of factors, including jurisdictional legal requirements, which are not discussed here.

If the transaction had been settled in cash the entry would simply have been:

	€	€
Liability	60,000	
Cash		60,000

If the transaction is settled in cash, any amount taken to equity during the vesting period (€7,600 in Example 34.41 above) is not adjusted. However, the entity may transfer it from one component of equity to another (see 4.2 above). *[IFRS 2.40]*.

10.1.4 Transactions with cash-settlement alternative for employee introduced after grant date

Such transactions are not specifically addressed in the main body of IFRS 2. However, IG Example 9 in the implementation guidance does address this issue, in the context of the rules for the modification of awards (discussed at 7.3 and 9.4 above). The substance of this example is reproduced as Example 34.42 below. *[IFRS 2 IG Example 9]*.

Example 34.42: Award with employee cash-settlement alternative introduced after grant

At the beginning of year 1, the entity grants 10,000 shares with a fair value of $33 per share to a senior executive, conditional upon the completion of three years' service. By the end of year 2, the fair value of the award has dropped to $25 per share. At that date, the entity adds a cash alternative to the grant, whereby the executive can choose whether to receive 10,000 shares or cash equal to the value of 10,000 shares on vesting date. The share price is $22 on vesting. The implementation guidance to IFRS 2 proposes the following approach.

For the first two years, the entity would recognise an expense of $110,000 per year, (representing 10,000 shares × $33 × 1/3), giving rise to the cumulative accounting entry by the end of year 2:

	$	$
Profit or loss (employee costs)	220,000	
Equity		220,000

The addition of a cash alternative at the end of year 2 constitutes a modification of the award, but does not increase the fair value of the award at the date of modification, which under either settlement alternative is $250,000 (10,000 shares × $25), excluding the effect of the non-market vesting condition as required by IFRS 2.

The fact that the employee now has the right to be paid in cash requires the 'split accounting' treatment set out in 10.1.2 above. Because of the requirement, under the rules for modification of awards (see 7.3 above), to recognise at least the grant date fair value of the original award, a minimum fair value of $330,000 has to be recognised over the vesting period.

At the modification date, a liability of $166,667 (representing 2/3 of the $250,000 fair value of the liability component at modification date) is recognised as a transfer from equity to liabilities, the entry being:

	$	$
Equity	166,667	
Liability		166,667

In year 3 an expense of $110,000 is recognised as the final portion of the original grant date fair value. In addition to this, the liability is remeasured from its modification date value of $250,000 ($25 × 10,000 shares) to its settlement date value of $220,000 ($22 × 10,000 shares) resulting in a credit of $30,000 to profit or loss. This results in the following accounting entry for the expense in year 3:

	$	$
Profit or loss	80,000*	
Liability		53,333†
Equity		26,667‡

* ((10,000 shares × $33 × 3/3) – ($220,000 expensed to date)) less the remeasurement of $30,000.

† Carried forward liability $220,000 (10,000 shares × year 3 fair value $22) less the brought forward liability $166,667.

‡ Balancing figure.

The implementation guidance to IFRS 2 analyses the $300,000 total expense over the three years as the grant date fair value of the award ($330,000) less the movement in the fair value of the liability alternative ($30,000, being the fair value of $250,000 at the end of year 2 less the fair value of $220,000 at vesting).

IG Example 9 only illustrates a situation where the grant date fair value of the equity-settled award exceeds the modification date fair value of both the equity and cash alternatives and the settlement date value of the cash alternative. In Example 34.39 at 9.4.1 above we consider alternative scenarios, including one where the modification date fair value exceeds the grant date fair value.

10.1.5 'Backstop' cash settlement rights

Some schemes may provide cash settlement rights to the holder so as to cover more or less remote contingencies. For example, an employee whose nationality and/or country of permanent residence is different from the jurisdiction of the reporting entity may be offered the option of cash settlement in case unforeseen future events make the transfer of equity from the entity's jurisdiction, or the holding or trading of it in the employee's country, inconvenient or impossible.

If the terms of the award provide the employee with a general right of cash-settlement, IFRS 2 requires the award to be treated as cash-settled. This is the case even if the right of cash settlement is extremely unlikely to be exercised (e.g. because it would give rise to adverse tax consequences for the employee as compared with equity settlement). If, however, the right to cash-settlement is exercisable only in specific circumstances, a more detailed analysis may be required (see 10.3 below).

10.1.6 Convertible bonds issued to acquire goods or services

In some jurisdictions entities issue convertible bonds to employees or other counterparties in exchange for goods or services. When this occurs, the bond will generally be accounted for under IFRS 2 rather than IAS 32 since it falls within the scope of IFRS 2 as a transaction 'in which the entity receives or acquires goods or services and the terms of the arrangement provide either the entity or the supplier of those goods or services with a choice of whether the entity settles the transaction in cash (or other assets) or by issuing equity instruments' (see 2.2.1 and 2.2.2 above). *[IFRS 2.2(c)]*.

As noted at 10.1 above, the methodology for splitting such an instrument into its liability and equity components under IFRS 2 differs from that under IAS 32. Moreover, under IAS 32 a convertible instrument is (broadly) recognised at fair value on the date of issue, whereas under IFRS 2 the fair value is accrued over time if the arrangement includes the rendering of services after the date of grant.

It is therefore possible that, if an entity has issued to employees convertible bonds that have also been issued in the market, the accounting treatment of the bonds issued to employees will differ significantly from that of the bonds issued in the market.

Where a convertible instrument is issued to an employee, the IFRS 2 expense will be based on the fair value of the instrument. However, if an entity issues a convertible instrument to a non-employee in return for an asset, for example a property, the entity will initially recognise a liability component at fair value and an equity component based on the difference between the fair value of the property and the fair value of the liability component. *[IFRS 2.35]*. If the fair value of the property were lower than the fair value of the instrument as a whole then, in our view, the entity should also recognise the shortfall in accordance with the requirements of IFRS 2 for unidentified goods or services. *[IFRS 2.13A]*. In the case of the acquisition of an asset, it is possible that this additional debit could be capitalised as part of the cost of the asset under IAS 16 – *Property, Plant and Equipment* – but in other cases it would be expensed.

After the initial IFRS 2 accounting outlined above, the question arises as to whether the subsequent accounting for the convertible instrument should be in accordance with IFRS 2 or IFRS 9. In our view, the instrument should generally continue to be accounted for under IFRS 2 until shares or cash are delivered to the counterparty. However, if the vested instrument were freely transferable or tradeable prior to conversion or settlement then a switch to IFRS 9 might be appropriate following transfer to a different counterparty (if considered practical to apply) – see also the discussion at 2.2.2.E above.

10.2 Transactions where the entity has choice of settlement in equity or in cash

The accounting treatment for transactions where the entity has choice of settlement is quite different from transactions where the counterparty has choice of settlement, in that:

- where the counterparty has choice of settlement, a liability component and an equity component are identified (see 10.1 above); whereas
- where the entity has choice of settlement, the accounting treatment is binary – in other words the whole transaction is treated either as cash-settled or as equity-settled, depending on whether or not the entity has a present obligation to settle in cash, *[IFRS 2.41]*, determined according to the criteria discussed in 10.2.1 below.

10.2.1 Transactions treated as cash-settled

IFRS 2 requires a transaction to be treated as a liability (and accounted for using the rules for cash-settled transactions discussed in 9 above) if:

(a) the choice of settlement has no commercial substance (for example, because the entity is legally prohibited from issuing shares);

(b) the entity has a past practice or stated policy of settling in cash; or

(c) the entity generally settles in cash whenever the counterparty asks for cash settlement. *[IFRS 2.41-42]*.

These criteria are fundamentally different from those in IAS 32 for derivatives over own shares (which is what cash-settled share-based payment transactions are) not within the scope of IFRS 2. IAS 32 rejects an approach based on past practice or intention and broadly requires all derivatives over own equity that could result in an exchange by the reporting entity of anything other than a fixed number of shares for a fixed amount of cash to be treated as giving rise to a financial instrument (see Chapter 47 at 4).

An important practical effect of the IFRS 2 criteria is that some schemes that may appear at first sight to be equity-settled may in fact have to be treated as cash-settled. For example, if an entity has consistently adopted a policy of granting *ex gratia* cash compensation to all those deemed to be 'good' leavers (or all 'good' leavers of certain seniority) in respect of partially vested share options, such a scheme may well be treated as cash-settled for the purposes of IFRS 2 to the extent to which there are expected to be such 'good' leavers during the vesting period. 'Good leaver' arrangements are also discussed at 5.3.9 above.

Another common example is that an entity may have a global share scheme with an entity option for cash settlement which it always exercises in respect of awards to employees in jurisdictions where it is difficult or illegal to hold shares in the parent. Such a scheme should be treated as a cash-settled scheme in respect of those jurisdictions. However, in our view, it would be appropriate to account for the scheme in other jurisdictions as equity-settled (provided of course that none of the criteria in (a) to (c) above applied in those jurisdictions).

Where an entity has accounted for a transaction as cash-settled, IFRS 2 gives no specific guidance as to the accounting treatment on settlement, but it is clear from other provisions of IFRS 2 that the liability should be remeasured to fair value at settlement date and:

- if cash-settlement occurs, the cash paid is applied to reduce the liability; and
- if equity-settlement occurs, the liability is transferred into equity (see 10.1.3.B above).

10.2.1.A Entity choice has no substance due to economic or other compulsion for cash settlement (including unlisted entity awards with a presumption of cash settlement)

Some awards may nominally give the reporting entity the choice of settling in cash or equity, while in practice giving rise to an economic compulsion to settle only in cash. In addition to the examples mentioned at 10.2.1 above, this will often be the case where an entity that is a subsidiary or owned by a small number of individuals, such as members of the same family, grants options to employees. In such cases there will normally be a very strong presumption that the entity will settle in cash in order to avoid diluting the existing owners' interests. Similarly, where the entity is not listed, there is little real benefit for an employee in receiving a share that cannot be realised except when another shareholder wishes to buy it or there is a change in ownership of the business as a whole.

In our view, such schemes are generally most appropriately accounted for as cash-settled schemes from inception. In any event, once the scheme has been operating for a while, it is likely that there will be a past practice of cash settlement such that the scheme is required to be treated as a liability under the general provisions of IFRS 2 summarised above.

A similar conclusion is often reached even where the terms of the agreement do not appear to offer the entity a choice of settling the award in cash but it has established a constructive obligation or a past practice of so doing (see 9.2.1 above).

10.2.2 Transactions treated as equity-settled

A transaction not meeting the criteria in 10.2.1 above to be treated as cash-settled should be accounted for as an equity-settled transaction using the rules for such transactions discussed in 4 to 8 above. *[IFRS 2.43]*.

However, when the transaction is settled the following approach is adopted:

(a) if the entity chooses to settle in cash, the cash payment is accounted for as the repurchase of an equity interest, i.e. as a deduction from equity, except as noted in (c) below;

(b) if the entity chooses to settle by issuing equity instruments, no further accounting is required (other than a transfer from one component of equity to another, if necessary), except as noted in (c) below;

(c) if the entity chooses the settlement alternative with the higher fair value, as at the date of settlement, the entity recognises an additional expense for the excess value given, i.e. the difference between the cash paid and the fair value of the equity instruments that would otherwise have been issued, or the difference between the fair value of the equity instruments issued and the amount of cash that would otherwise have been paid, whichever is applicable. *[IFRS 2.43]*.

This is illustrated in Examples 34.43 and 34.44 below.

Example 34.43: Settlement of transaction treated as equity-settled where fair value of cash settlement exceeds fair value of equity settlement

An entity has accounted for a share-based payment transaction where it has the choice of settlement as an equity-settled transaction, and has recognised a cumulative expense of £1,000 based on the fair value at grant date.

At settlement date the fair value of the equity-settlement option is £1,700 and that of the cash-settlement option £2,000. If the entity settles in equity, no further accounting entry is required by IFRS 2. However, either at the entity's discretion or in compliance with local legal requirements, there may be a transfer within equity of the £1,000 credited to equity during the vesting period.

If the entity settles in cash, the entity must recognise an additional expense of £300, being the difference between the fair value of the equity-settlement option (£1,700) and that of the cash-settlement option (£2,000). The accounting entry is:

	£	£
Profit or loss (employee costs)	300	
Equity	1,700	
Cash		2,000

Example 34.44: Settlement of transaction treated as equity-settled where fair value of equity settlement exceeds fair value of cash settlement

As in Example 34.43, an entity has accounted for a share-based payment transaction where it has the choice of settlement as an equity-settled transaction, and has recognised a cumulative expense of £1,000 based on the fair value at grant date.

In this case, however, at settlement date the fair value of the equity-settlement option is £2,000 and that of the cash-settlement option £1,700. If the entity chooses to settle in equity, it must recognise an additional expense of £300, being the difference between fair value of the equity-settlement option (£2,000) and that of the cash-settlement option (£1,700). The accounting entry is:

	£	£
Profit or loss (employee costs)	300	
Equity		300

No further accounting entry is required by IFRS 2. However, either at the entity's discretion or in compliance with local legal requirements, there may be a transfer within equity of the £1,300 credited during the vesting period and on settlement.

If the entity settles in cash, no extra expense is recognised, and the accounting entry is:

	£	£
Equity	1,700	
Cash		1,700

It can be seen in this case that, if the transaction is settled in equity, an additional expense is recognised. If, however, the transaction had simply been an equity-settled transaction (i.e. with no cash alternative), there would have been no additional expense on settlement and the cumulative expense would have been only £1,000 based on the fair value at grant date.

10.2.3 Change in entity's settlement policy or intention leading to change in classification of award after grant date

IFRS 2 does not specify whether a transaction where the entity has a choice of settlement in equity or cash should be assessed as equity-settled or cash-settled only at the inception of the transaction or also at each reporting date until it is settled.

However, in describing the accounting treatment IFRS 2 states several times that the accounting depends on whether the entity '*has a present obligation* to settle in cash' (our emphasis added). In our view, this suggests that IFRS 2 intends the position to be reviewed at each reporting date and not just considered at the inception of the transaction.

IFRS 2 does not specify how to account for a change in classification resulting from a change in the entity's policy or intention. In our view, the most appropriate treatment is to account for such a change as if it were a modification of the manner of settlement of the award (see 9.4 above). Where the entity is able to choose the manner of settlement, the substance of the situation is the same as a decision to modify the manner of settlement of an award which does not already give the entity a choice. These situations are distinct from those where the manner of settlement depends on the outcome of a contingent event outside the entity's control (see 10.3 below).

10.3 Awards requiring cash or equity settlement in specific circumstances (awards with contingent cash or contingent equity settlement)

This section is written with a focus on awards with contingent cash settlement. However, similar considerations will apply in a situation where it is the settlement in equity that depends on the outcome of circumstances outside the control of the entity or both the entity and the counterparty.

Rather than giving either the entity or the counterparty a general right to choose between equity- or cash-settlement, some awards require cash settlement in certain specific and limited circumstances but otherwise will be equity-settled. These arrangements are referred to by IAS 32 as contingent settlement provisions and are driven by the occurrence or non-occurrence of specific outcomes rather than by choice (see Chapter 47 at 4.3). In the absence of specific guidance in IFRS 2, questions then arise as to whether such an award should be accounted for as equity-settled or cash-settled and whether this should be re-assessed on an ongoing basis during the vesting period. This is a subject that has been considered by both the Interpretations Committee and the IASB and their discussions are considered further at 10.3.5 below.

In the sections below we consider:

- two different approaches to the assessment of awards with contingent cash settlement (see 10.3.1 to 10.3.2 below);
- awards that require cash settlement on a change of control (see 10.3.3 below); and
- the accounting treatment for changes in the manner of settlement where the award is contingent on future events (see 10.3.4 and 10.3.5 below).

10.3.1 Approach 1 – Treat as cash-settled if contingency is outside entity's control

One approach might be to observe that the underlying principle that determines whether an award is accounted for as equity-settled or cash-settled under IFRS 2 appears to be whether the reporting entity can unilaterally avoid cash-settlement (see 10.1 and 10.2 above). Under this approach, any award where the counterparty has a right to cash-settlement is always treated as a liability, irrespective of the probability of cash-settlement, since there is nothing that the entity could do to prevent cash-settlement. By contrast, an award where the choice of settlement rests with the entity is accounted for as a liability only where the entity's own actions have effectively put it in a position where it has no real choice but to settle in cash.

Applying this approach, it is first of all necessary to consider whether the event that requires cash-settlement is one over which the entity has control. If the event, however unlikely, is outside the entity's control, then under this approach the award should be treated as cash-settled. However, if the event is within the entity's control, the award should be treated as cash-settled only if the entity has a liability by reference to the criteria summarised in 10.1 and 10.2 above.

Whilst, in our view, this is an acceptable accounting approach, it does not seem entirely satisfactory. For example, in a number of jurisdictions, it is common for an equity-settled share-based payment award to contain a provision to the effect that, if the employee dies in service, the entity will pay to the employee's estate the fair value of the award in cash. The analysis above would lead to the conclusion that the award must be classified as cash-settled, on the basis that it is beyond the entity's control whether or not an employee dies in service. This seems a somewhat far-fetched conclusion, and is moreover inconsistent with the accounting treatment that the entity would apply to any other death-in-service benefit under IAS 19. IAS 19 would generally require the entity to recognise a liability for such a benefit based on an actuarial estimate (see Chapter 35 at 3.6), rather than on a presumption that the entire workforce will die in service.

10.3.2 Approach 2 – Treat as cash-settled if contingency is outside entity's control and probable

It was presumably considerations such as those above that led the FASB staff to provide an interpretation[25] of the equivalent provisions of ASC 718 regarding awards that are cash-settled in certain circumstances. This interpretation states that a cash settlement feature that can be exercised only upon the occurrence of a contingent event that is outside the employee's control does not give rise to a liability until it becomes probable that that event will occur.[26]

In our view, an approach based on the probability of a contingent event that is outside the control of both the counterparty and the entity is also acceptable under IFRS and is frequently applied in practice. The implied rationale (by reference to IFRS literature) is that:

- IFRS 2 clearly notes a number of inconsistencies between IFRS 2 and IAS 32 (see 1.4.1 above) and so there is no requirement to follow IAS 32 in respect of contingent cash settlement arrangements; and
- it is therefore appropriate to have regard to the principles of IAS 37 in determining whether an uncertain future event gives rise to a liability. IAS 37 requires a liability to be recognised only when it is probable (i.e. more likely than not) to occur (see Chapter 26).

The impact of Approach 1 and Approach 2 can be illustrated by reference to an award that requires cash-settlement in the event of a change of control of the entity (see 10.3.3 below).

10.3.3 Application of Approach 1 and Approach 2 to awards requiring cash settlement on a change of control

It is not uncommon for the terms of an award to provide for compulsory cash-settlement by the entity if there is a change of control of the reporting entity. Such a provision ensures that there is no need for any separate negotiations to buy out all employee options, so as to avoid non-controlling interests arising in the acquired entity when equity-settled awards are settled after the change of control.

The question of whether or not a change of control is within the control of the entity is a matter that has been the subject of much discussion in the context of determining the classification of certain financial instruments by their issuer, and is considered more fully in Chapter 47 at 4.3.

If the facts and circumstances of a particular case indicate that a change of control is within the entity's control, the conclusion under either Approach 1 or Approach 2 above would be that the award should be treated as cash-settled only if the entity has a liability by reference to the criteria summarised in 10.2.1 above.

If, however, the change of control is not considered to be within the control of the reporting entity, the conclusion will vary depending on whether Approach 1 or Approach 2 is followed. Under Approach 1, an award requiring settlement in cash on a change of control outside the control of the entity would be treated as cash-settled, however unlikely the change of control may be. Under Approach 2 however, an award requiring settlement in cash on a change of control outside the control of the entity would be treated as cash-settled only if a change of control were probable.

A difficulty with Approach 2 is that it introduces rather bizarre inconsistencies in the accounting treatment for awards when the relative probability of their outcome is considered. As noted at 10.1.5 above, an award that gives the counterparty an absolute right to cash-settlement is accounted for as a liability, however unlikely it is that the counterparty will exercise that right. Thus, under this approach, the entity could find itself in the situation where it treats:

- as a liability: an award with an unrestricted right to cash-settlement for the counterparty, where the probability of the counterparty exercising that right is less than 1%; but
- as equity: an award that requires cash settlement in the event of a change of control which is assessed as having a 49% probability of occurring.

In our view, an entity may adopt either of these accounting treatments, but should do so consistently and state its policy for accounting for such transactions if material.

In selecting an accounting policy, an entity should however be aware of the IASB's discussions on whether an approach based on the 'probable' outcome should be applied or whether an approach based on the accounting treatment for a compound instrument should be used (see 10.3.5 below).

There is further discussion at 15.4 below of awards that vest or are exercisable on a flotation or change of control, including the question of whether a cash-settlement obligation rests with the entity itself or with other parties involved in the change of control (see 15.4.6 below).

10.3.4 *Accounting for change in manner of settlement where award is contingent on future events outside the control of the entity and the counterparty*

When, under Approach 2 above, the manner of settlement of an award changes solely as a consequence of a re-assessment of the probability of a contingent event, there is neither settlement of the award nor modification of its original terms (see 10.3.4.A below for discussion of awards that have also been modified). The terms of the award are such that there have been two potential outcomes, one equity-settled and one cash-settled, running in parallel since grant date. It is as if, in effect, the entity has simultaneously issued two awards, only one of which will vest.

At each reporting date the entity should assess which outcome is more likely and account for the award on an equity- or cash-settled basis accordingly. In our view, any adjustments arising from a switch between the cumulative amount for the cash-settled award and the cumulative amount for the equity-settled award should be taken to profit or loss in the current period. This is similar to the approach for an award with multiple independent vesting conditions (see 6.3.6 above).

When applying an approach where the two outcomes have both been part of the arrangement from grant date, an entity measures the fair value of the equity-settled award only at the original grant date and there is no remeasurement of the equity-settled award on reassessment of the settlement method. As the cash-settled award would be remeasured on an ongoing basis, a switch in the manner of settlement during the period until the shares vest or the award is settled in cash could give rise to significant volatility in the cumulative expense. At the date of vesting or settlement, however, the cumulative expense will equate to either the grant date fair value of the equity-settled approach or the settlement value of the cash-settled approach depending on whether or not the contingent event has happened.

The situation discussed in this section (i.e. an arrangement with two potential outcomes from grant date because the manner of settlement is not within the control of either the entity or the counterparty) is not the same as an award where the manner of settlement is entirely within the entity's control. Where the entity has such control and therefore a choice of settlement, a change in the manner of settlement is treated as a modification with a potential catch-up adjustment through equity (see 9.4 and 10.2.3 above).

As noted at 10.3.5 below, discussions by the Interpretations Committee indicated a preference for treating an award as equity-settled or cash-settled in its entirety, based on the probable outcome, rather than as a compound instrument, but subsequent discussions by the IASB were divided.

10.3.4.A *Distinction between re-assessment of settlement method and modification of terms of award*

Some awards include arrangements for contingent cash-settlement if an event outside the control of the entity and the counterparty, such as some forms of exit, has not happened within a certain timescale. During the initial period of such an arrangement there might be an expectation that the exit (or other event) will take place. In this case, the award would be treated as equity-settled using an approach based on the probability of this outcome, as outlined at 10.3.4 above. However, if it is decided, close to the end of the period during which equity-settlement would apply, to modify the terms of the award so that this period is extended, the entity needs to re-assess the arrangement on both its original and modified terms.

It might therefore be the case that cash-settlement under the original terms of the award becomes the more likely outcome for a short time and that the entity has to switch the award from an equity-settled to a cash-settled basis in line with the guidance at 10.3.4 above. If a modification is then made to extend the period during which the award can be equity-settled and hence the settlement in cash once again becomes less likely, the entity should then switch again to an equity-settled basis of accounting using modification accounting (see 9.4.2 above).

10.3.5 Manner of settlement contingent on future events: discussions by the IASB and the Interpretations Committee

Following an earlier request to the Interpretations Committee for clarification on how share-based payment transactions should be classified and measured if the manner of settlement is contingent on either:

- a future event that is outside the control of both the entity and the counterparty; or
- a future event that is within the control of the counterparty,

the IASB agreed that transactions in which the manner of settlement is contingent on future events should be considered together with other issues relating to IFRS 2 (see 3.4 above).[27]

Prior to discussion by the IASB, the Interpretations Committee discussed the matter again in May 2013, noting that paragraph 34 of IFRS 2 requires an entity to account on a cash-settled basis if, and to the extent that, the entity has incurred a liability to settle in cash or other assets. However, it was further noted that IFRS 2 only provides guidance where the entity or the counterparty has a choice of settlement and not where the manner of settlement is contingent on a future event that is outside the control of both parties. The Interpretations Committee also observed that it was unclear which other guidance within IFRS and the *Conceptual Framework* would provide the best analogy to this situation. It was concluded that there was significant diversity in practice.[28]

In September 2013, the Interpretations Committee noted that the results of additional outreach indicated that shared-based payment transactions in which the manner of settlement is contingent on a future event within the control of the counterparty (but not the entity) are not significantly widespread and so the Committee decided not to add this element of the original submission to its agenda.[29]

The Interpretations Committee also returned to the question of accounting when the manner of settlement is contingent on a future event that is outside the control of both the entity and the counterparty. It was noted that such arrangements are settled either in cash or in equity instruments in their entirety and that neither party to the arrangement has control over the manner of settlement. Accordingly, the Committee observed that the share-based payment should be classified as either equity-settled or cash-settled in its entirety depending on which outcome is probable.

The Interpretations Committee also discussed the accounting for a change in classification of the transaction arising from a change in the more likely settlement method. A majority of the Committee thought that there should be a cumulative adjustment recorded at the time of the change of classification, in such a way that the cumulative cost would be the same as if the change of classification had occurred at the inception of the arrangement (see 10.3.4 above). The Committee decided to recommend that the IASB make a narrow-scope amendment to IFRS 2 based on the approach above.[30]

The IASB discussed these recommendations in February 2014. Some IASB members expressed concern over use of a 'probable' approach for deciding the classification of a share-based payment. They took the view that such share-based payment transactions were similar to those in which the counterparty has a choice of settlement method because the entity does not have the unconditional right to avoid delivering cash or other assets. Therefore they considered that such arrangements should be accounted for, by analogy, in accordance with the compound instrument approach set out in paragraphs 35 to 40 of IFRS 2, noting that this would also be consistent with the requirements for contingent settlement provisions in IAS 32.[31]

The topic was discussed again by the IASB in April 2014 when, notwithstanding the diversity in practice, the Board decided not to propose an amendment to IFRS 2 for this issue. Some IASB members were concerned that the suggested amendment would introduce a principle for distinguishing between a liability and equity in IFRS 2 that would be inconsistent with the requirements of IAS 32 and also noted that the definition of a liability was being discussed as part of the Conceptual Framework project (see Chapter 2).[32]

The IASB revised the *Conceptual Framework* in 2018 without addressing the above mentioned issue; the boundary between liabilities and equity will be further explored by the IASB in its research project on *Financial Instruments with Characteristics of Equity* (see 1.4.1 above). Until such time as any revised guidance is issued, we expect Approach 1 or Approach 2, outlined at 10.3.1 and 10.3.2 above, to continue to be applied.

10.4 Cash settlement alternative where cash sum is not based on share price or value

Some awards may provide a cash-settlement alternative that is not based on the share price. For example, an employee might be offered a choice between 500 shares or €1,000,000 on the vesting of an award. Whilst an award of €1,000,000, if considered in isolation, would obviously not be a share-based payment transaction, it nevertheless falls within the scope of IFRS 2, rather than – say – IAS 19, if it is offered as an alternative to a transaction that is within the scope of IFRS 2. The Basis for Conclusions to IFRS 2 states that the cash alternative may be fixed or variable and, if variable, may be determinable in a manner that is related, or unrelated, to the price of the entity's shares. *[IFRS 2.BC256]*.

11 REPLACEMENT SHARE-BASED PAYMENT AWARDS ISSUED IN A BUSINESS COMBINATION

11.1 Background

It is frequently the case that an entity (A) acquires another (B) which, at the time of the business combination, has outstanding employee share options or other share-based awards. If no action were taken by A, employees of B would be entitled, once any vesting conditions had been satisfied, to shares in B. This is not a very satisfactory outcome for either party: A now has non-controlling (minority) shareholders in subsidiary B, which was previously wholly-owned, and the employees of B are the owners of unmarketable shares in an effectively wholly-owned subsidiary.

The obvious solution, adopted in the majority of cases, is for some mechanism to be put in place such that the employees of B end up holding shares in the new parent A. This can be achieved, for example, by:

- A granting options over its own shares to the employees of B in exchange for the surrender of the employees' options over the shares of B; or
- changing the terms of the options so that they are over a special class of shares in B which are mandatorily convertible into shares of A.

This raises the question of how such a substitution transaction should be accounted for in the consolidated financial statements of A (the treatment in the single entity financial statements of B is discussed at 11.4 below).

IFRS 3 addresses the accounting treatment required in a business combination where an acquirer:

- replaces acquiree awards on a mandatory basis (see 11.2.1 below);
- replaces acquiree awards on a voluntary basis, even if the acquiree awards would not expire as a consequence of the business combination (see 11.2.2 below); or
- does not replace acquiree awards (see 11.3 below).

Section 11 relates only to business combinations. Share-based payment arrangements in the context of group reorganisations are addressed at 12.8 below.

11.2 Replacement awards in business combinations accounted for under IFRS 3

A more comprehensive discussion of the requirements of IFRS 3 may be found in Chapter 9.

IFRS 3 requires an acquirer to measure a liability or an equity instrument related to the replacement of an acquiree's share-based payment awards in accordance with IFRS 2, rather than in accordance with the general principles of IFRS 3. References to the 'fair value' of an award in the following discussion therefore mean the fair value determined under IFRS 2, for which IFRS 3 uses the term 'market-based measure'. The fair value measurement is to be made as at the acquisition date determined in accordance with IFRS 3. *[IFRS 3.30]*.

IFRS 3 notes that a transaction entered into by or on behalf of the acquirer or primarily for the benefit of the acquirer or the combined entity, rather than that of the acquiree (or its former owners) before the combination, is likely to be a transaction separate from the business combination itself. This includes a transaction that remunerates employees or former owners of the acquiree for future services. *[IFRS 3.52]*. Target entities will therefore need to consider carefully whether any modifications to existing share-based payment arrangements in the period leading up to the business combination are straightforward modifications by the target entity for its own benefit or that of its owners at the time (and hence fully within the scope of IFRS 2) or whether the changes need to be assessed under the guidance in IFRS 3 because they are for the benefit of the acquirer or the combined entity. The indicators in paragraph B50 of IFRS 3 should be used to determine when the modification should be measured and recognised. *[IFRS 3.B50]*.

The Application Guidance in Appendix B to IFRS 3 and the illustrative examples accompanying the standard explain how the general principle of paragraph 52 is to be applied to replacement share-based payment transactions. Essentially, however, IFRS 3 appears to view an exchange of share options or other share-based payment awards in conjunction with a business combination as a form of modification (see 7.3 above). *[IFRS 3.B56]*.

11.2.1 Awards that the acquirer is 'obliged' to replace

Where the acquirer is 'obliged' to replace the acquiree awards (see below), either all or a portion of the fair value of the acquirer's replacement awards forms part of the consideration transferred in the business combination. *[IFRS 3.B56]*.

IFRS 3 regards the acquirer as 'obliged' to replace the acquiree awards if the acquiree or its employees have the ability to enforce replacement, for example if replacement is required by:

- the terms of the acquisition agreement;
- the terms of the acquiree's awards; or
- applicable laws or regulations. *[IFRS 3.B56]*.

The required treatment of replacement awards may be summarised as follows:

(a) at the date of acquisition, the fair values of the replacement award and the original award are determined in accordance with IFRS 2;

(b) the amount of the replacement award attributable to pre-combination service (and therefore included as part of the consideration transferred for the business) is determined by multiplying the fair value of the original award by the ratio of the vesting period completed, as at the date of the business combination, to the greater of:

  - the total vesting period, as determined at the date of the business combination (being the period required to satisfy all vesting conditions, including conditions added to, or removed from, the original award by the replacement award); and
  - the original vesting period; and

(c) any excess of the fair value of the replacement award over the amount determined in (b) above is recognised as a post-combination remuneration expense, in accordance with the normal principles of IFRS 2 (see 3 to 7 above). *[IFRS 3.B57-59]*.

The requirements summarised in (a) to (c) above have the effect that any excess of the fair value of the replacement award over the original award is recognised as a post-combination remuneration expense. The requirement in (b) above has the effect that, if the replacement award requires service in the period after the business combination, an IFRS 2 cost is recognised in the post-combination period, even if the acquiree award being replaced had fully vested at the date of acquisition. It also has the effect that if a replacement award requires no service in the post-combination period, but the acquiree award being replaced would have done so, a cost must be recognised in the post-combination period. *[IFRS 3.B59]*.

There is no specific guidance in IFRS 3 on how and when to recognise the post-combination remuneration expense in the consolidated financial statements of the acquirer. In our view, the expense should be recognised over the post-combination vesting period of the replacement award in accordance with the general principles of IFRS 2 (see 6.2 to 6.4 above).

The portions of the replacement award attributable to pre- and post-combination service calculated in (b) and (c) above are calculated, under the normal principles of IFRS 2, based on the best estimate of the number of awards expected to vest (or to be treated as vesting by IFRS 2). Rather than being treated as adjustments to the consideration for the business combination, any changes in estimates or forfeitures occurring after the acquisition date are reflected in remuneration cost for the period in which the changes occur in accordance with the normal principles of IFRS 2. Similarly, the effects of other post-acquisition events, such as modifications or the outcome of performance conditions, are accounted for in accordance with IFRS 2 as part of the determination of the remuneration expense for the period in which such events occur. *[IFRS 3.B60]*. The application of these requirements is discussed in more detail at 11.2.3 below.

The requirements above to split an award into pre-combination and post-combination portions apply equally to equity-settled and cash-settled replacement awards. All changes after the acquisition date in the fair value of cash-settled replacements awards and their tax effects (recognised in accordance with IAS 12 – *Income Taxes*) are recognised in the post-combination financial statements when the changes occur. *[IFRS 3.B61-62]*. IFRS 3 does not specify where in the income statement any changes in the pre-combination element of a cash-settled award should be reflected and, in the absence of clear guidance, an entity will need to consider whether this is remuneration expense or whether it is closer to a change in a liability for contingent consideration.

The treatment of the income tax effects of replacement share-based payment transactions in a business combination is discussed further in Chapter 33 at 10.8.5.

11.2.1.A Illustrative examples of awards that the acquirer is 'obliged' to replace

IFRS 3 provides some examples in support of the written guidance summarised above, the substance of which is reproduced as Examples 34.45 to 34.48 below. *[IFRS 3.IE61-71]*. These deal with the following scenarios.

Is post-combination service required for the replacement award?	**Has the acquiree award being replaced vested before the combination?**	**Example**
Not required	Vested	34.45
Not required	Not vested	34.46
Required	Vested	34.47
Required	Not vested	34.48

In all the examples, it is assumed that the replacement award is equity-settled.

Example 34.45: Replacement award requiring no post-combination service replacing vested acquiree award

Entity A acquires Entity B and issues replacement awards with a fair value at the acquisition date of €1.1 million for awards of Entity B with a fair value at the acquisition date of €1.0 million. No post-combination services are required for the replacement awards and Entity B's employees had rendered all of the required service for the acquiree awards as of the acquisition date.

The amount attributable to pre-combination service, and therefore included in the consideration transferred in the business combination, is the fair value of Entity B's awards at the acquisition date (€1.0 million). The amount attributable to post-combination service is €0.1 million, the difference between the total value of the replacement awards (€1.1 million) and the portion attributable to pre-combination service (€1.0 million). Because no post-combination service is required for the replacement awards, Entity A immediately recognises €0.1 million as remuneration cost in its post-combination financial statements.

Example 34.46: Replacement award requiring no post-combination service replacing unvested acquiree award

Entity A acquires Entity B and issues replacement awards with a fair value at the acquisition date of €1.0 million for awards of Entity B also with a fair value at the acquisition date of €1.0 million. When originally granted, the awards of Entity B had a vesting period of four years and, as of the acquisition date, the employees of Entity B had rendered two years' service. The replacement award vests in full immediately.

The portion of the fair value of the replacement awards attributable to pre-combination services is the fair value of the award of Entity B being replaced (€1 million) multiplied by the ratio of the pre-combination vesting period (two years) to the greater of the total vesting period (now two years) and the original vesting period of Entity B's award (four years). Thus, €0.5 million (€1.0 million × 2/4 years) is attributable to pre-combination service and therefore included in the consideration transferred for the acquiree. The remaining €0.5 million is attributable to post-combination service, but, because no post-combination service is required for the replacement award to vest, Entity A recognises the entire €0.5 million immediately as remuneration cost in the post-combination financial statements.

Example 34.47: Replacement award requiring post-combination service replacing vested acquiree award

Entity A acquires Entity B and issues replacement awards with a fair value at the acquisition date of €1.0 million for awards of Entity B also with a fair value at the acquisition date of €1.0 million. The replacement awards require one year of post-combination service. The awards of Entity B being replaced had a vesting period of four years. As of the acquisition date, employees of Entity B holding unexercised vested awards had rendered a total of seven years of service since the grant date.

Even though the Entity B employees have already rendered all of the service for their original awards, Entity A attributes a portion of the replacement award to post-combination remuneration cost, because the replacement awards require one year of post-combination service. The total vesting period is five years – the vesting period for the original Entity B award completed before the acquisition date (four years) plus the vesting period for the replacement award (one year). The fact that the employees have rendered seven years of service in total in the pre-combination period is not relevant to the calculation because only four years of that service were necessary in order to earn the original award.

The portion attributable to pre-combination services equals the fair value of the award of Entity B being replaced (€1 million) multiplied by the ratio of the pre-combination vesting period (four years) to the total vesting period (five years). Thus, €0.8 million (€1.0 million × 4/5 years) is attributed to the pre-combination vesting period and therefore included in the consideration transferred in the business combination. The remaining €0.2 million is attributed to the post-combination vesting period and is recognised as remuneration cost in Entity A's post-combination financial statements in accordance with IFRS 2, over the remaining one year vesting period.

Example 34.48: Replacement award requiring post-combination service replacing unvested acquiree award

Entity A acquires Entity B and issues replacement awards with a fair value at the acquisition date of €1.0 million for awards of Entity B also with a fair value at the acquisition date of €1.0 million. The replacement awards require one year of post-combination service. When originally granted, the awards of Entity B being replaced had a vesting period of four years and, as of the acquisition date, the employees had rendered two years' service.

The replacement awards require one year of post-combination service. Because employees have already rendered two years of service, the total vesting period is three years. The portion attributable to pre-combination services equals the fair value of the award of Entity B being replaced (€1 million) multiplied by the ratio of the pre-combination vesting period (two years) to the greater of the total vesting period (three years) or the original vesting period of Entity B's award (four years). Thus, €0.5 million (€1.0 million × 2/4 years) is attributable to pre-combination service and therefore included in the consideration transferred for the acquiree. The remaining €0.5 million is attributable to post-combination service and therefore recognised as remuneration cost in Entity A's post-combination financial statements, over the remaining one year vesting period.

11.2.2 Acquiree awards that the acquirer is not 'obliged' to replace

IFRS 3 notes that, in some situations, acquiree awards may expire as a consequence of a business combination. In such a situation, the acquirer might decide to replace those awards even though it is not obliged to do so. It might also be the case that the acquirer decides voluntarily to replace awards that would not expire and which it is not otherwise obliged to replace.

Under IFRS 3 there is no difference in the basic approach to accounting for a replacement award that the acquirer is obliged to make and one that it makes on a voluntary basis (i.e. the approach is as set out at 11.2.1 above). In other words, the accounting is based on the fair value of the replacement award at the date of acquisition, with an apportionment of that amount between the cost of acquisition and post-acquisition employment expense.

However, in situations where the acquiree awards would expire as a consequence of the business combination if they were not voluntarily replaced by the acquirer, none of the fair value of the replacement awards is treated as part of the consideration transferred for the business (and therefore included in the computation of goodwill), but the full amount is instead recognised as a remuneration cost in the post-combination financial statements. The IASB explains that this is because the new award by the acquirer can only be for future services to be provided by the employee as the acquirer has no obligation to the employee in respect of past services. *[IFRS 3.B56, BC311B]*.

11.2.3 Accounting for changes in vesting assumptions after the acquisition date

Whilst the requirements outlined at 11.2.1 above to reflect changes in assumptions relating to the post-acquisition portion of an award through post-combination remuneration appear consistent with the general principles of IFRS 2 and IFRS 3, the application of the requirements to the pre-combination portion is less straightforward.

Paragraph B60 of IFRS 3 appears to require all changes to both the pre- and post-combination portions of the award to be reflected in post-combination remuneration expense. *[IFRS 3.B60]*. This could lead to significant volatility in post-combination profit or loss as a consequence of forfeitures, or other changes in estimates, relating to awards accounted for as part of the consideration for the business combination.

A second approach relies on a combination of paragraphs B60 and B63(d). Whilst paragraph B60 is clear that no adjustment can be made to the purchase consideration, paragraph B63(d) refers to IFRS 2 providing 'guidance on subsequent measurement and accounting for *the portion of replacement share-based payment awards ... that is attributable to employees' future services'* (emphasis added). *[IFRS 3.B60, B63(d)]*. Supporters of this view therefore argue that the remeasurement requirements of paragraph B60 apply only to the portion of the replacement award that is attributed to future service and that the award should be split into two parts:

- a pre-combination element that is treated as if it were vested at the acquisition date and then accounted for in the same way as other contingent consideration settled in equity; and
- a post-combination portion that is treated as a new award and reflects only the employees' post-combination service.

A third approach is based on the guidance in paragraph B59 of IFRS 3 which states that 'the acquirer attributes any excess of the market-based measure of the replacement award over the market-based measure of the acquiree award to post-combination service and recognises that excess as remuneration cost in the post-combination financial statements'. *[IFRS 3.B59]*. As for the second approach above, the pre-combination element is considered to be fixed and cannot be reversed. However, any subsequent changes in assumptions that give rise to an incremental expense over the amount recognised as pre-combination service should be recognised as part of the post-combination remuneration expense.

Whilst the second and third approaches above are more consistent with the general requirement under IFRS 2 that vested awards should not be adjusted, the first approach, based on paragraph B60, is arguably the most obvious reading of IFRS 3. In the absence of clear guidance in the standard, we believe that an entity may make an accounting policy choice between the three approaches but, once chosen, the policy should be applied consistently.

The three approaches are illustrated in Example 34.49 below.

Example 34.49: Accounting for post-acquisition changes in estimates relating to replacement awards

Entity A grants an award of 1,000 shares to each of two employees. The award will vest after three years provided the employees remain in service. At the end of year 2, Entity A is acquired by Entity B which replaces the award with one over its own shares but otherwise on the same terms. The fair value of each share at the date of acquisition is €1. At this date, Entity B estimates that one of the two employees will leave employment before the end of the remaining one year service period.

At the date of acquisition, Entity B recognises €667 (1 employee × 1,000 shares × €1 × 2/3) as part of the consideration for the business combination and expects to recognise a further €333 as an expense through post-acquisition profit or loss (1 × 1,000 × €1 × 1/3).

However, if the estimates made as at the date of the acquisition prove to be inaccurate and either both employees leave employment during year 3, or both remain in employment until the vesting date, there are three alternative approaches to the accounting as explained above:

- Approach 1 – all changes in estimates are reflected in post-acquisition profit or loss (drawing on paragraph B60 of IFRS 3);
- Approach 2 – changes to the estimates that affect the amount recognised as part of the purchase consideration are not adjusted for and changes affecting the post-acquisition assumptions are adjusted through post-acquisition profit or loss (drawing on paragraph B63(d) of IFRS 3); or
- Approach 3 – the amount attributable to pre-combination service, and treated as part of the business combination, is fixed and cannot be reversed. However, any changes in assumptions that give rise to an additional cumulative expense are reflected through post-acquisition profit or loss (drawing on paragraph B59 of IFRS 3).

Using the fact pattern above, and assuming that both employees leave employment in the post-acquisition period, the three alternative approaches would give rise to the following entries in accounting for the forfeitures:

- Approach 1 – a credit of €667 to post-acquisition profit or loss to reflect the reversal of the amount charged to the business combination. In addition to this, any additional expense that had been recognised in the post-acquisition period would be reversed.
- Approaches 2 and 3 – the reversal through post-acquisition profit or loss of any additional expense that had been recognised in the post-acquisition period.

If, instead, both employees remained in employment in the post-acquisition period and both awards vested, the three alternative approaches would give rise to the following entries:

- Approach 1 – an expense of €1,333 through post-acquisition profit or loss to reflect the remaining €333 fair value of the award to the employee who was expected to remain in service plus €1,000 for the award to the employee who was not expected to remain in service.
- Approach 2 – an expense of €666 (2 × €333) through post-acquisition profit or loss for the remaining 1/3 of the acquisition date fair value of the two awards. There is no adjustment to the business combination or to post-acquisition profit or loss for the €667 pre-acquisition element of the award that, as at the acquisition date, was not expected to vest.
- Approach 3 – an expense of €1,333 through post-acquisition profit or loss to reflect the remaining €333 fair value of the award to the employee who was expected to remain in service plus €1,000 for the award to the employee who was not expected to remain in service.

11.3 Acquiree award not replaced by acquirer

It may occasionally happen that the acquirer does not replace awards of the acquiree at the time of the acquisition. This might be the case where, for example, the acquired subsidiary is only partly-owned and is itself listed.

IFRS 3 distinguishes between vested and unvested share-based payment transactions of the acquiree that are outstanding at the date of the business combination but which the acquirer chooses not to replace.

If vested, the outstanding acquiree share-based payment transactions are treated by the acquirer as part of the non-controlling interest in the acquiree and measured at their IFRS 2 fair value at the date of acquisition.

If unvested, the outstanding share-based payment transactions are fair valued in accordance with IFRS 2 as if the acquisition date were the grant date. The fair value should be allocated to the non-controlling interest in the acquiree on the basis of the ratio of the portion of the vesting period completed to the greater of:

- the total vesting period; and
- the original vesting period of the share-based payment transactions.

The balance is treated as a post-combination remuneration expense in accordance with the general principles of IFRS 2. *[IFRS 3.B62A-B62B]*. Forfeitures in the post-combination period will need to be assessed in accordance with the approaches set out at 11.2.3 above.

11.4 Financial statements of the acquired entity

The replacement of an award based on the acquiree's equity with one based on the acquirer's equity is, from the perspective of the acquired entity, a cancellation and replacement, to be accounted for in accordance with the general principles of IFRS 2 for such transactions (see 7.4 above). However, in addition to considerations about whether this is accounted for as a separate cancellation and new grant or as a modification of the original terms, the acquiree needs to take into account its new status as a subsidiary of the acquirer.

If the acquirer is responsible for settling the award in its own equity with the acquiree's employees, the acquiree will continue to account for the award on an equity-settled basis. If, however, the acquiree is responsible for settling the award with shares of the acquirer, then the acquiree would have to switch from an equity-settled basis of accounting to a cash-settled basis of accounting (see 2.2.2.A and 9.4.1 above). *[IFRS 2.43B, B52(b), B55]*.

Even if the acquiree continues to account for the award on an equity-settled basis, the share-based payment expense recorded in the consolidated financial statements (based on fair value at the date of the business combination) will generally not be the same as that in the financial statements of the acquired entity (based on fair value at the date of original grant plus any incremental value granted at the date of acquisition, if modification accounting is applied). The exact timing of the recognition of the expense in the financial statements of the acquired entity after the date of cancellation and replacement will depend on its interpretation of the requirements of IFRS 2 for the cancellation and replacement of options (see Example 34.29 at 7.4.4.B above).

12 GROUP SHARE SCHEMES

In this section we consider various aspects of share-based payment arrangements operated within a group and involving several legal entities. The focus of the section is on the accounting by the various parties involved and includes several comprehensive illustrative examples. The main areas covered are as follows:

- typical features of a group share scheme (see 12.1 below);
- a summary of the accounting treatment of group share schemes (see 12.2 below);
- employee benefit trusts ('EBTs') and similar vehicles (see 12.3 below);
- an example of a group share scheme (based on an equity-settled award satisfied by a market purchase of shares) illustrating the accounting by the different entities involved (see 12.4 below);
- an example of a group share scheme (based on an equity-settled award satisfied by a fresh issue of shares) illustrating the accounting by the different entities involved (see 12.5 below);
- an example of a group cash-settled transaction where the award is settled by an entity other than the one receiving goods or services (see 12.6 below);
- the accounting treatment when an employee transfers between group entities (see 12.7 below); and
- group reorganisations (see 12.8 below).

Whilst associates and joint arrangements accounted for as joint ventures do not meet the definition of group entities, there will sometimes be share-based payment arrangements that involve the investor or venturer and the employees of its associate or joint venture. These arrangements are discussed at 12.9 below.

12.1 Typical features of a group share scheme

In this section we use the term 'share scheme' to encompass any transaction falling within the scope of IFRS 2, whether accounted for as equity-settled or cash-settled.

It is common practice for a group to operate a single share scheme covering several subsidiaries. Depending on the commercial needs of the entity, the scheme might cover all group entities, all group entities in a particular country or all employees of a particular grade throughout a number of subsidiaries.

The precise terms and structures of group share schemes are so varied that it is rare to find two completely identical arrangements. From an accounting perspective, however, group share schemes can generally be reduced to a basic prototype, as described below, which will serve as the basis of the discussion.

A group scheme typically involves transactions by several legal entities:

- the parent, over whose shares awards are granted;
- the subsidiary employing an employee who has been granted an award ('the employing subsidiary'); and
- the trust that administers the scheme. Such trusts are known by various names in different jurisdictions, but, for the sake of convenience, in this section we will use the term 'EBT' ('employee benefit trust') to cover all such vehicles by whatever

name they are actually known. The accounting treatment of transactions with EBTs is discussed at 12.3 below.

In practice, it might not always be a simple assessment to determine which entity is receiving an employee's services and which entity is responsible for settling the award. For example, the scheme may be directed by a group employee services entity or an individual might be a director of the parent as well as providing services to other operating entities within the group.

Where an employee services company is involved it will be necessary to evaluate the precise group arrangements in order to decide whether that entity is, in substance, the employer or whether the entity or entities to which it makes a recharge for an individual's services should be treated as the employer(s). It will also often be the case that the services company is simply administering the arrangements on behalf of the parent entity.

Where an individual provides services to more than one group entity, an assessment will need to be made as to which entity or entities are receiving the individual's services in return for the award. This will depend on the precise facts and circumstances of a particular situation.

A share-based award is often granted to an employee by the parent, or a group employee services entity, which will in turn have an option exercisable against the EBT for the shares that it may be required to deliver to the employee. Less commonly, the trustees of the EBT make awards to the employees and enter into reciprocal arrangements with the parent.

If the parent takes the view that it will satisfy any awards using existing shares it will often seek to fix the cash cost of the award by arranging for the EBT to purchase in the market, on the day that the award is made, sufficient shares to satisfy all or part of the award. This purchase will be funded by external borrowings, a loan from the parent, a contribution from the employing subsidiary, or some combination. The cash received from the employee on exercise of the option can be used by the EBT to repay any borrowings.

If the parent takes the view that it will satisfy the options with a fresh issue of shares, these will be issued to the EBT, either:

(a) at the date on which the employee exercises his option (in which case the EBT will subscribe for the new shares using the cash received from the employee together with any non-refundable contribution made by the employing subsidiary – see below). Such arrangements are generally referred to as 'simultaneous funding';

(b) at some earlier date (in which case the EBT will subscribe for the new shares using external borrowings, a loan from the parent or a contribution from the employing subsidiary, or some combination. The cash received from the employee on exercise of the option may then be used by the EBT to repay any borrowings). Such arrangements are generally referred to as 'pre-funding'; or

(c) some shares will be issued before the exercise date as in (b) above, and the balance on the exercise date as in (a) above.

As noted in (a) above, the employing subsidiary often makes a non-refundable contribution to the EBT in connection with the scheme, so as to ensure that employing subsidiaries bear an appropriate share of the overall cost of a group-wide share scheme.

12.2 Accounting treatment of group share schemes – summary

12.2.1 Background

From a financial reporting perspective, it is generally necessary to consider the accounting treatment in:

- the group's consolidated financial statements;
- the parent's separate financial statements; and
- the employing subsidiary's financial statements.

We make the assumption throughout section 12 that the subsidiary is directly owned by the parent company. In practice, there will often be one or more intermediate holding companies between the ultimate parent and the subsidiary. The intermediate parent company generally will not be the entity granting the award, receiving the goods or services or responsible for settling the award. Therefore, under IFRS 2, we believe that there is no requirement for the intermediate company to account for the award in its separate or individual financial statements (although it might choose to recognise an increase in its investment in the subsidiary and a corresponding capital contribution from the ultimate parent in order for the transaction to be reflected throughout the chain of companies).

The accounting entries to be made in the various financial statements will broadly vary according to:

- whether the award is satisfied using shares purchased in the market or a fresh issue of shares;
- whether any charge is made to the employing subsidiary for the cost of awards to its employees;
- whether an employee benefit trust (EBT) is involved. The accounting treatment of transactions undertaken with and by EBTs is discussed in more detail at 12.3 below; and
- the tax consequences of the award. However, for the purposes of the discussion and illustrative examples below, tax effects are ignored, since these will vary significantly by jurisdiction. A more general discussion of the tax effects of share-based payment transactions may be found at 14 below and in Chapter 33 at 10.8.

12.2.2 Scope of IFRS 2 for group share schemes

By virtue of the definition of 'share-based payment transaction' (see 2.2.1 and 2.2.2.A above), a group share-based payment transaction is in the scope of IFRS 2 for:

- the consolidated financial statements of the group (the accounting for which follows the general principles set out in 3 to 10 above);
- the separate or individual financial statements of the entity in the group that receives goods or services (see 12.2.3 below); and
- the separate or individual financial statements of the entity in the group (if different from that receiving the goods or services) that settles the transaction with the counterparty. This entity will typically, but not necessarily, be the parent (see 12.2.4 below).

IFRS 2 provides further guidance on the application of its general principles to:

- transactions settled in the equity of the entity, or in the equity of its parent (see 12.2.5 below); and
- cash-settled transactions settled by a group entity other than the entity receiving the goods or services (see 12.2.6 below).

At 2.2.2.A above we consider seven scenarios commonly found in practice and outline the approach required by IFRS 2 in the consolidated and separate or individual financial statements of group entities depending on whether the award is settled in cash or shares and which entity grants the award, has the obligation to settle the award and receives the goods or services.

It is common practice in a group share scheme to require each participating entity in the group to pay a charge, either to the parent or to an EBT, in respect of the cost of awards made under the scheme to employees of that entity. This is generally done either as part of the group's cash-management strategy, or in order to obtain tax relief under applicable local legislation. The amount charged could in principle be at the discretion of the group, but is often based on either the fair value of the award at grant date or the fair value at vesting, in the case of an award of free shares, or exercise, in the case of an award of options.

IFRS 2 does not directly address the accounting treatment of such intragroup management charges and other recharge arrangements, which is discussed further at 12.2.7 below. *[IFRS 2.B45-46]*.

Worked examples illustrating how these various principles translate into accounting entries are given at 12.4 to 12.6 below.

12.2.3 Entity receiving goods or services

The entity in a group receiving goods or services in a share-based payment transaction determines whether the transaction should be accounted for, in its separate or individual financial statements, as equity-settled or cash-settled. It does this by assessing the nature of the awards granted and its own rights and obligations. *[IFRS 2.43A]*.

The entity accounts for the transaction as equity-settled when either the awards granted are the entity's own equity instruments, or the entity has no obligation to settle the share-based payment transaction. Otherwise, the entity accounts for the transaction as cash-settled. Where the transaction is accounted for as equity-settled it is remeasured after grant date only to the extent permitted or required by IFRS 2 for equity-settled transactions generally, as discussed at 3 to 7 above. *[IFRS 2.43B]*.

IFRS 2 notes that a possible consequence of these requirements is that the amount recognised by the entity may differ from the amount recognised by the consolidated group or by another group entity settling the share-based payment transaction. *[IFRS 2.43A]*. This is discussed further at 12.6 below.

The cost recognised by the entity receiving goods or services is always calculated according to the principles set out above, regardless of any intragroup recharging arrangement. *[IFRS 2.43D, B45]*. The accounting for such arrangements is discussed at 12.2.7 below.

12.2.4 Entity settling the transaction

A group entity which settles a share-based payment transaction in which another group entity receives goods or services accounts for the transaction as an equity-settled share-based payment transaction only if it is settled in the settling entity's own equity instruments. Otherwise, the transaction is accounted for as cash-settled. *[IFRS 2.43C]*.

IFRS 2 specifies only the credit entry – the classification of the transaction as equity- or cash-settled, and its measurement. IFRS 2 does not specify the debit entry, which is therefore subject to the general requirement of IFRS 2 that a share-based payment transaction should normally be treated as an expense, unless there is the basis for another treatment under other IFRS (see 3 above).

In our view, the settling entity is not always required to treat the transaction as an expense:

- Where the settling entity is a parent (direct or indirect) of the entity receiving the goods or services and is accounting for the transaction as equity-settled, it will generally account for the settlement under IAS 27 – *Separate Financial Statements* – as an addition to the cost of its investment in the employing subsidiary (or of that holding company of the employing subsidiary which is the settling entity's directly-held subsidiary). *[IFRS 2.B45]*. It may then be necessary to review the carrying value of that investment to ensure that it is not impaired.
- Where the settling entity is a parent (direct or indirect) of the entity receiving the goods or services and is accounting for the transaction as cash-settled (whereas the subsidiary will be accounting for the transaction as equity-settled), in our view it has an accounting policy choice for the treatment of the remeasurement of the cash-settled liability. Either:
  - it accounts for the entire award as part of the contribution to the subsidiary and therefore as an addition to the cost of its investment in the employing subsidiary (or of that holding company of the employing subsidiary which is the settling entity's directly-held subsidiary); or
  - after the initial capitalisation of the grant date fair value of the liability, it remeasures the liability through profit or loss.

  Whichever policy is chosen, it may then be necessary to review the carrying value of the investment to ensure that it is not impaired.
- In other cases (i.e. where the settling entity is a subsidiary (direct or indirect) or fellow subsidiary of the entity receiving the goods or services), it should treat the settlement as a distribution, and charge it directly to equity. Whether or not such a settlement is a legal distribution is a matter of law in the jurisdiction concerned.

We adopt the approach of full capitalisation by the parent entity in the worked examples set out in 12.4 to 12.6 below.

12.2.5 Transactions settled in equity of the entity or its parent

12.2.5.A Awards settled in equity of subsidiary

Where a subsidiary grants an award to its employees and settles it in its own equity, the subsidiary accounts for the award as equity-settled.

The parent accounts for the award as equity-settled in its consolidated financial statements. In its separate financial statements, the parent is not required by IFRS 2 to account for the award. In both cases, the transaction may have implications for other aspects of the financial statements, since its settlement results in the partial disposal of the subsidiary (see Chapter 7).

Where the parent is responsible for settling the award, it accounts for the transaction as equity-settled in its consolidated financial statements. In its separate financial statements, however, it accounts for the award as cash-settled, since it is settled not in its own equity, but in the equity of the subsidiary. From the perspective of the parent's separate financial statements, the equity of a subsidiary is a financial asset. *[IFRS 2.B50].*

12.2.5.B *Awards settled in equity of the parent*

Where the parent grants an award directly to the employees of a subsidiary and settles it in its own equity, the subsidiary accounts for the award as equity-settled, with a corresponding increase in equity as a contribution from the parent. *[IFRS 2.B53].*

The parent accounts for the award as equity-settled in both its consolidated and separate financial statements. *[IFRS 2.B54].*

Where a subsidiary grants an award of equity in its parent to its employees and settles the award itself, it accounts for the award as cash-settled, since it is settled not in its own equity, but in the equity of its parent. From the perspective of the subsidiary's separate or individual financial statements, the equity of the parent is a financial asset. *[IFRS 2.B55].*

This requirement potentially represents something of a compliance burden. For the purposes of the parent's consolidated financial statements the fair value of the award needs to be calculated once, at grant date. For the purposes of the subsidiary's financial statements, however, IFRS 2 requires the award to be accounted for as cash-settled, with the fair value recalculated at each reporting date.

It is, however, important to note that IFRS 2 requires this accounting treatment only for a subsidiary that 'grants' such an award. *[IFRS 2.B52, B53, B55].* In some jurisdictions it is normal for grants of share awards to be made by the parent, or an employee service company or EBT, rather than by the subsidiary, although the subsidiary may well make recommendations to the grantor of the award as to which of its employees should benefit.

In those cases, the fact that the subsidiary may communicate the award to the employee does not necessarily mean that the subsidiary itself has granted the award. It may simply be notifying the employee of an award granted by another group entity and which the other group company has the obligation to settle. In that case the subsidiary should apply the normal requirement of IFRS 2 to account for the award as equity-settled.

12.2.6 *Cash-settled transactions not settled by the entity receiving goods or services*

IFRS 2 considers arrangements in which the parent has an obligation to make cash payments to the employees of a subsidiary linked to the price of either:

- the subsidiary's equity instruments; or
- the parent's equity instruments.

In both cases, the subsidiary has no obligation to settle the transaction and therefore accounts for the transaction as equity-settled, recognising a corresponding credit in equity as a contribution from its parent.

The subsidiary then subsequently remeasures the cost of the transaction only for any changes resulting from non-market vesting conditions not being met in accordance with the normal provisions of IFRS 2 discussed at 3 to 6 above. IFRS 2 points out that this will differ from the measurement of the transaction as cash-settled in the consolidated financial statements of the group. *[IFRS 2.B56-57]*.

In both cases, the parent has an obligation to settle the transaction in cash. Accordingly, the parent accounts for the transaction as cash-settled in both its consolidated and separate financial statements. *[IFRS 2.B58]*.

The requirement for the subsidiary to measure the transaction as equity-settled is somewhat controversial. The essential rationale for requiring the subsidiary to record the cost of a share-based payment transaction settled by its parent is to reflect that the subsidiary is effectively receiving a capital contribution from its parent.

The IASB specifically considered whether it would be more appropriate to measure that contribution by reference to the cash actually paid by the parent, but concluded that the approach adopted in IFRS 2 better reflects the perspective of the subsidiary as a separate reporting entity. An accounting treatment based on the cash paid by the parent would, in the IASB's view, reflect the perspective of the parent rather than that of the subsidiary. *[IFRS 2.BC268H-268K]*.

12.2.7 Intragroup recharges and management charges

As noted at 12.2.2 above, IFRS 2 does not deal specifically with the accounting treatment of intragroup recharges and management charges that may be levied within the group on the subsidiary that receives goods or services, the consideration for which is equity instruments or cash provided by another group entity.

The timing of the recognition of intercompany recharges was considered by the Interpretations Committee in 2013 (see 12.2.7.A below).

The accounting requirements of IFRS 2 for group share schemes derive from IFRIC 11 (now incorporated within IFRS 2 – see 1.2 above), which was based on an exposure draft (D17) published in 2005.

D17 proposed that any such payment made by a subsidiary should be charged directly to equity, on the basis that it represents a return of the capital contribution recorded as the credit to equity required by IFRS 2 (see 12.2.3 and 12.2.6 above) up to the amount of that contribution, and a distribution thereafter.[33]

In our view, whilst IFRS 2 as currently drafted does not explicitly require this treatment, this is likely to be the more appropriate analysis for most cases where the amount of the recharge or management charge to a subsidiary is directly related to the value of the share-based payment transaction. Indeed, the only alternative, 'mechanically' speaking, would be to charge the relevant amount to profit or loss. This would result in a double charge (once for the IFRS 2 charge, and again for the management charge or recharge) which we consider not only less desirable for most entities, but also less appropriate in cases where the amounts are directly related. Accordingly, in the examples at 12.4 to 12.6 below, we apply the treatment originally proposed in D17 to any payments made by the subsidiary for participation in the group scheme.

Many intragroup recharge arrangements are based directly on the value of the underlying share-based payment – typically at grant date, vesting date or exercise date. In other cases, a more general management charge might be levied that reflects not just share-based payments but also a number of other arrangements or services provided to the subsidiary by the parent. Where there is a more general management charge of this kind, we believe that it is more appropriate for the subsidiary to recognise a double charge to profit or loss (once for the IFRS 2 charge, and again for the management charge) rather than debiting the management charge to equity as would be the case for a direct recharge.

IFRS 2 also does not address how the parent should account for a recharge or management charge received. In our view, to the extent that the receipt represents a return of a capital contribution made to the subsidiary, the parent may choose whether to credit:

- the carrying amount of its investment in the subsidiary; or
- profit or loss (with a corresponding impairment review of the investment).

Even if part of the recharge received is credited to the carrying amount of the investment, any amount received in excess of the capital contribution previously debited to the investment in subsidiary should be accounted for as a distribution from the subsidiary and credited to the income statement of the parent. Where applicable, the illustrative examples at 12.4 to 12.6 below show the entire amount as a credit to the income statement of the parent rather than part of the recharge being treated as a credit to the parent's investment in its subsidiary.

The treatment of a distribution from a subsidiary in the separate financial statements of a parent is more generally discussed in Chapter 8 at 2.4.

A further issue that arises in practice is the timing of recognition of the recharge by the parties to the arrangement. The treatment adopted might depend to some extent on the precise terms and whether there are contractual arrangements in place, but two approaches generally result in practice:

- to account for the recharge when it is actually levied or paid (which is consistent with accounting for a distribution); or
- to accrue the recharge over the life of the award or the recharge agreement even if, as is commonly the case, the actual recharge is only made at vesting or exercise date.

An entity should choose the more appropriate treatment for its particular circumstances. The first approach is often the more appropriate in a group context where recharge arrangements might be rather informal and therefore not binding until such time as a payment is made. It is also consistent with the overall recognition of the arrangement through equity. The second approach, which is likely to be the more appropriate approach when a liability is considered to exist in advance of the payment date, is closer in some respects to the accounting treatment of a provision or financial liability but, unlike the requirements of IAS 37 or IFRS 9, reflects changes in the recognised amount through equity rather than profit or loss and builds up the recharge liability over the life of the award rather than recognising the liability in full when a present obligation has been identified.

Whichever accounting treatment is adopted, any adjustments to the amount to be recognised as a recharge, whether arising from a change in the IFRS 2 expense or other changes, should be recognised in the current period and previous periods should not be restated.

Where applicable, the examples at 12.4 to 12.6 below illustrate the first of the two treatments outlined above and recognise the recharge only when it becomes payable at the date of exercise.

12.2.7.A Timing of recognition of intercompany recharges: discussion by the IFRS Interpretations Committee

In January 2013 the Interpretations Committee discussed whether a subsidiary's liability to pay to its parent the settlement value of share-based payments made by the parent to the subsidiary's employees should be recognised by the subsidiary from the grant date of the award or only at the date of settlement of the award.

While outreach conducted by the Interpretations Committee suggested that there is diversity in practice (as indicated at 12.2.7 above), the Interpretations Committee concluded in May 2013 that the topic could not be restricted to recharges relating to share-based payments and therefore decided not to add this issue to its agenda.[34]

12.3 Employee benefit trusts ('EBTs') and similar arrangements

12.3.1 Background

For some time entities have established trusts and similar arrangements for the benefit of employees. These are known by various names in different jurisdictions, but, for the sake of convenience, in this section we will use the term 'EBT' ('employee benefit trust') to cover all such vehicles by whatever name they are actually known.

The commercial purposes of using such vehicles vary from employer to employer, and from jurisdiction to jurisdiction, but may include the following:

- An EBT, in order to achieve its purpose, needs to hold shares that have either been issued to it by the entity or been bought by the EBT on the open market. In some jurisdictions, the direct holding of shares in an entity by the entity itself is unlawful.
- In the case of longer-term benefits the use of an EBT may 'ring fence' the assets set aside for the benefit of employees in case of the insolvency of the entity.
- The use of an EBT may be necessary in order to achieve a favourable tax treatment for the entity or the employees, or both.

The detailed features of an EBT will again vary from entity to entity, and from jurisdiction to jurisdiction, but typical features often include the following:

- The EBT provides a warehouse for the shares of the sponsoring entity, for example by acquiring and holding shares that are to be sold or transferred to employees in the future. The trustees may purchase the shares with finance provided by the sponsoring entity (by way of cash contributions or loans), or by a third-party bank loan, or by a combination of the two. Loans from the entity are usually interest-free. In other cases, the EBT may subscribe directly for shares issued by the sponsoring entity or acquire shares in the market.
- Where the EBT borrows from a third party, the sponsoring entity will usually guarantee the loan, i.e. it will be responsible for any shortfall if the EBT's assets are insufficient to meet its debt repayment obligations. The entity will also generally make regular contributions to the EBT to enable the EBT to meet its interest payments, i.e. to make good any shortfall between the dividend income of the EBT (if any) and the interest payable. As part of this arrangement the trustees may waive their right to dividends on the shares held by the EBT.
- Shares held by the EBT are distributed to employees through an employee share scheme. There are many different arrangements – these may include:
  - the purchase of shares by employees when exercising their share options under a share option scheme;
  - the purchase of shares by the trustees of an approved profit-sharing scheme for allocation to employees under the rules of the scheme; or
  - the transfer of shares to employees under some other incentive scheme.
- The trustees of an EBT may have a legal duty to act at all times in accordance with the interests of the beneficiaries under the EBT. However, most EBTs (particularly those established as a means of remunerating employees) are specifically designed so as to serve the purposes of the sponsoring entity, and to ensure that there will be minimal risk of any conflict arising between the duties of the trustees and the interest of the entity.

12.3.2 Accounting for EBTs

Historically, transactions involving EBTs were accounted for according to their legal form. In other words, any cash gifted or lent to the EBT was simply treated as, respectively, an expense or a loan in the financial statements of the employing entity.

However, this treatment gradually came to be challenged, not least by some tax authorities who began to question whether it was appropriate to allow a corporate tax deduction for the 'expense' of putting money into an EBT which in some cases might remain in the EBT for some considerable time (or even be lent back to the entity) before being actually passed on to employees. Thus, the issue came onto the agenda of the national standard setters.

The accounting solution proposed by some national standard setters, such as those in the United States and the United Kingdom, was to require a reporting entity to account for an EBT as an extension of the entity. The basis for this treatment was essentially that, as noted at 12.3.1 above, EBTs are specifically designed to serve the purposes of the sponsoring entity, and to ensure that there will be minimal risk of any conflict arising between the duties of the trustees and the interest of the entity, suggesting that they are under the *de facto* control of the entity.

Unlike the approach required by some national standard setters, IFRS does not mandate the treatment of an EBT as an extension of the sponsoring entity in that entity's separate financial statements and the accounting treatment in the separate entity is therefore less clear under IFRS (see 12.3.4 below). If an entity does not treat the EBT as an extension of itself in its own financial statements it will need to assess for its consolidated IFRS financial statements whether the EBT should be consolidated as a separate vehicle. This assessment will be based on the control criteria set out in IFRS 10, as discussed in more detail in Chapter 6. However, in summary, the entity will need to decide whether:

- it has power over the EBT;
- it has exposure, or rights, to variable returns from its involvement with the EBT; and
- it has the ability to use its power over the EBT to affect the amount of the sponsoring entity's returns.

Paragraphs BC70 to BC74 of the Basis for Conclusions to IFRS 2 are clearly written on the assumption that the trust referred to in paragraph BC70 is being included in the financial statements of the reporting entity. This suggests that the IASB regards the consolidation of such vehicles as normal practice. *[IFRS 2.BC70-74].*

In addition to a decision as to whether it is appropriate to consolidate an EBT, reporting entities also need to make an assessment as to the level within a group at which the EBT should be consolidated i.e. whether the EBT is controlled by a sponsoring entity at a sub-group level or whether just by the ultimate parent entity. In many cases, an EBT holding shares in the ultimate parent entity will be considered to be under the control of that entity but there will be exceptions in some group scenarios. The discussion below generally assumes that the reporting entity is the sponsoring entity of the EBT and consolidates an EBT holding the reporting entity's own shares.

Consolidation of an EBT will have the following broad consequences for the consolidated financial statements of the reporting entity:

- Until such time as the entity's own shares held by the EBT vest unconditionally in employees (e.g. as the result of the vesting of an award of ordinary shares, or the exercise of a vested option over ordinary shares):
  - any consideration paid for the shares should be deducted in arriving at shareholders' equity in accordance with IAS 32 (see Chapter 47 at 9); and
  - the shares should be treated as if they were treasury shares when calculating earnings per share under IAS 33 (see Chapter 37 at 3.2).
- Other assets and liabilities (including borrowings) of the EBT should be recognised as assets and liabilities in the consolidated financial statements of the sponsoring entity.

- No gain or loss should be recognised in profit or loss on the purchase, sale, issue or cancellation of the entity's own shares, as required by IAS 32. Although not explicitly required by IFRS, we suggest that entities show consideration paid or received for the purchase or sale of the entity's own shares in an EBT separately from other purchases and sales of the entity's own shares in the reconciliation of movements in shareholders' equity. This may be particularly relevant for entities in jurisdictions that distinguish between 'true' treasury shares (i.e. those legally held by the issuing entity) and those accounted for as such under IFRS (such as those held by an EBT).
- Any dividend income arising on own shares should be excluded in arriving at profit before tax and deducted from the aggregate of dividends paid and proposed. In our view, the deduction should be disclosed if material.
- Finance costs and any administration expenses should be charged as they accrue and not as funding payments are made to the EBT.

The discussion above, and in the remainder of Section 12, focuses on arrangements where the EBT holds unallocated shares of the reporting entity and/or shares that have been allocated to employees in connection with share awards but where the awards have not yet vested unconditionally. There will also be situations in practice in which an EBT reaches the stage where, or is designed so that, it only holds shares to which employees have full entitlement (i.e. the shares are fully vested). In this situation the shares are beneficially owned and controlled by the individual employees but might remain in trust for tax or other reasons in the period following vesting. Where an EBT does not hold any unvested shares and there are no other assets or liabilities in the EBT over which the entity continues to exercise control, there will be nothing left in the EBT to be consolidated.

12.3.3 Illustrative Examples – awards satisfied by shares purchased by, or issued to, an EBT

The following Examples assume that the EBT is consolidated in accordance with IFRS 10 and show the interaction of the requirements of IFRS 10 with those of IFRS 2. Example 34.50 illustrates the treatment where an award is satisfied using shares previously purchased in the market. Example 34.51 illustrates the treatment where freshly issued shares are used.

Example 34.50: Interaction of IFRS 10, IAS 32 and IFRS 2 (market purchase)

On 1 January in year 1, the EBT of ABC plc made a market purchase of 100,000 shares of ABC plc at £2.50 per share. These were the only ABC shares held by the EBT at that date.

On 1 May in the same year, ABC granted executives options over between 300,000 and 500,000 shares at £2.70 per share, which will vest at the end of year 1, the number vesting depending on various performance criteria. It is determined that the cost to be recognised in respect of this award under IFRS 2 is £0.15 per share.

Four months later, on 1 September, the EBT made a further market purchase of 300,000 shares at £2.65 per share.

At the end of year 1, options vested over 350,000 shares and were exercised immediately.

The accounting entries for the above transaction required by IFRS 10, IAS 32 and IFRS 2 in the consolidated financial statements of ABC would be as set out below. It should be noted that all these pronouncements require various entries to be recorded in 'equity'. Thus, some variation may be found in practice as to the precise characterisation of the reserves, depending on local legal requirements and other 'traditions' in national GAAP which are retained to the extent that they do not conflict with IFRS.

	£	£
1 January		
Own shares (equity)	250,000	
Cash		250,000
To record purchase of 100,000 £1 shares at £2.50/share		
1 May – 31 December		
Profit or loss	52,500	
Equity[†]		52,500
To record cost of vested 350,000 options at £0.15/option		
1 September		
Own shares (equity)	795,000	
Cash		795,000
To record purchase of 300,000 £1 shares at £2.65/share		

	£	£
31 December		
Cash	945,000	
Equity[†][1]		945,000
Receipt of proceeds on exercise of 350,000 options at £2.70/share		
Equity[†]	914,375	
Own shares (equity)[2]		914,375
Release of shares from EBT to employees		

[1] This reflects the fact that the entity's resources have increased as a result of a transaction with an owner, which gives rise to no gain or loss and is therefore credited direct to equity.

[2] It is necessary to transfer the cost of the shares 'reissued' by the EBT out of own shares, as the deduction for own shares would otherwise be overstated. The total cost of the pool of 400,000 shares immediately before vesting was £1,045,000 (£250,000 purchased on 1 January and £795,000 purchased on 1 September), representing an average cost per share of £2.6125. £2.6125 × 350,000 shares = £914,375.

[†] We recommend that, subject to any local legal restrictions, these amounts should all be accounted for in the same component of equity.

Example 34.50 illustrates the importance of keeping the accounting treatment required by IAS 32 for the cost of the shares completely separate from that for the cost of the award required by IFRS 2. In cash terms, ABC has made a 'profit' of £30,625, since it purchased 350,000 shares with a weighted average cost of £914,375 and issued them to the executives for £945,000. However, this 'profit' is accounted for entirely within equity, whereas a calculated IFRS 2 cost of £52,500 is recognised in profit or loss.

Example 34.51: Interaction of IFRS 10, IAS 32 and IFRS 2 (fresh issue of shares)

On 1 January in year 1, the EBT of ABC plc subscribed for 100,000 £1 shares of ABC plc at £2.50 per share, paid for in cash provided by ABC by way of loan to the EBT. Under local law, these proceeds must be credited to the share capital account up to the par value of the shares issued, with any excess taken to a share premium account (additional paid-in capital). These were the only ABC shares held by the EBT at that date.

On 1 May in the same year, ABC granted executives options over between 300,000 and 500,000 shares at £2.70 per share, which will vest at the end of year 1, the number vesting depending on various performance criteria. It is determined that the cost to be recognised in respect of this award is £0.15 per share.

Four months later, on 1 September, the EBT subscribed for a further 300,000 shares at £2.65 per share, again paid for in cash provided by ABC by way of loan to the EBT.

At the end of year 1, options vested over 350,000 shares and were exercised immediately.

The accounting entries for the above transaction required by IFRS 10, IAS 32 and IFRS 2 in the consolidated financial statements of ABC would be as set out below. It should be noted that all these pronouncements require various entries to be recorded in 'equity'. Thus, some variation may be found in practice as to the precise characterisation of the reserves, depending on local legal requirements and other 'traditions' in national GAAP which are retained to the extent that they do not conflict with IFRS.

	£	£
1 January		
Equity[†1]	250,000	
Share capital		100,000
Share premium		150,000
To record issue of 100,000 £1 shares to EBT at £2.50/share		
1 May – 31 December		
Profit or loss	52,500	
Equity[†]		52,500
To record cost of vested 350,000 options at £0.15/option		
	£	£
1 September		
Equity[†1]	795,000	
Share capital		300,000
Share premium		495,000
To record issue of 300,000 £1 shares at £2.65/share		
31 December		
Cash	945,000	
Equity[2†]		945,000
Receipt of proceeds on exercise of 350,000 options at £2.70/share		

[1] This entry is required to reconcile the requirement of local law to record an issue of shares with the fact that, in reality, there has been no increase in the resources of the reporting entity. All that has happened is that one member of the reporting group (the EBT) has transferred cash to another (the parent entity). In our view, this amount should not necessarily be accounted for within any 'Own shares reserve' in equity if such a reserve is generally restricted to shares acquired from third parties.

[2] This reflects the fact that the entity's resources have increased as a result of a transaction with an owner, which gives rise to no gain or loss and is therefore credited direct to equity.

[†] We recommend that, subject to any local legal restrictions, these amounts should all be accounted for in the same component of equity.

12.3.4 Separate financial statements of sponsoring entity

As noted at 12.3.2 above, in contrast to some national GAAPs, where an EBT is treated as a direct extension of the parent or other sponsoring entity, such that the assets and liabilities of the EBT are included in both the separate financial statements of the sponsoring entity and the group consolidated financial statements, under IFRS the accounting model is *prima facie* to treat the EBT as a separate group entity.

This means that the separate financial statements of the sponsoring entity must show transactions and balances with the EBT rather than the transactions, assets and liabilities of the EBT. This raises some accounting problems, for some of which IFRS currently provides no real solution, as illustrated by Example 34.52 below. This has led the Interpretations Committee and others to discuss whether the 'separate entity' approach to accounting for EBTs is appropriate (see further discussion below).

Example 34.52: EBTs in separate financial statements of sponsoring entity

An entity lends its EBT €1 million which the EBT uses to make a market purchase of 200,000 shares in the entity. In the separate financial statements of the EBT the shares will be shown as an asset. In the consolidated financial statements, the shares will be accounted for as treasury shares, by deduction from equity.

In the separate financial statements of the entity, on the basis that the EBT is a separate entity, like any other subsidiary, the normal accounting entry would be:

	€	€
Loan to EBT	1,000,000	
Cash		1,000,000

The obvious issue with this approach is that it is, in economic substance, treating the shares held by the EBT (represented by the loan to the EBT) as an asset of the entity, whereas, if they were held directly by the entity, they would have to be accounted for as treasury shares, by deduction from equity. If the share price falls such that the EBT has no means of repaying the full €1,000,000, *prima facie* this gives rise to an impairment of the €1,000,000 loan. Again, however, this seems in effect to be recognising a loss on own equity.

Suppose now that employees are granted options over the shares. The options have an exercise price of zero and a value under IFRS 2 of €1,200,000. The entity will therefore book an expense of €1,200,000 under IFRS 2. When the options are exercised, the shares are delivered to employees. At that point the €1,000,000 loan to the EBT clearly becomes irrecoverable (as it has no assets), and must be written off. Normally, the write-off of an investment or loan is an expense required to be recognised in profit or loss. However, to recognise the €1,000,000 loan write-off as an expense as well as the €1,200,000 IFRS 2 charge would clearly be a form of double counting.

Some suggest that a solution to this problem is to say that the entity has effectively bought a gross-settled call option over its own shares from the EBT, whereby it can require the EBT to deliver 200,000 shares in return for a waiver of its €1,000,000 loan. Thus the accounting for the settlement of the call over the shares is as for any other gross-settled purchased call option over own equity under IAS 32 – see Chapter 47 at 11.2.1.

	€	€
Own shares (deduction from equity)	1,000,000	
Loan to EBT		1,000,000

When the shares are delivered to employees (some milliseconds later), the entry is:

	€	€
Other component of equity	1,000,000	
Own shares (deduction from equity)		1,000,000

At its meetings in May and July 2006, the Interpretations Committee discussed whether the EBT should be treated as an extension of the sponsoring entity, such as a branch, or as a separate entity. The Interpretations Committee decided to explore how specific transactions between the sponsor and the EBT should be treated in the sponsor's separate or individual financial statements and whether transactions between the EBT and the sponsor's employees should be attributed to the sponsor.

Interestingly, the Interpretations Committee fell short of dismissing the 'extension of the parent company' approach and has not since revisited this topic other than to re-confirm in March 2011 that it had not become aware of additional concerns or of diversity in practice and hence it did not think it necessary for this to be considered for the IASB's agenda. In our view, whilst any requirement to consolidate EBTs under

IFRS 10 could be argued to give a clear steer towards treating the EBT as a separate entity, until there is any final clarification of this issue, it appears acceptable to treat an EBT as an extension of the sponsoring entity in that entity's separate financial statements. This treatment would result in outcomes essentially the same as those in Examples 34.50 and 34.51 above, while avoiding the problems highlighted in Example 34.52 above.

12.3.5 Financial statements of the EBT

The EBT may be required to prepare financial statements in accordance with requirements imposed by local law or by its own trust deed. The form and content of such financial statements are beyond the scope of this chapter.

12.4 Illustrative example of group share scheme – equity-settled award satisfied by market purchase of shares

The discussion in 12.4.1 to 12.4.3 below is based on Example 34.53 and addresses the accounting treatment for three distinct aspects of a group share scheme – a share-based payment arrangement involving group entities (see 12.2 above), the use of an EBT (see 12.3 above) and a group recharge arrangement (see 12.2.7 above).

This illustrative example treats the recharge by the parent to the subsidiary as an income statement credit in the individual accounts of the parent and recognises the recharge when it is paid. In some situations, entities might consider it appropriate to apply alternative accounting treatments (see 12.2.7 above).

Example 34.53: Group share scheme (market purchase of shares)

On 1 July 20x1 an employee of S Limited, a subsidiary of the H plc group, is awarded options under the H group share scheme over 3,000 shares in H plc at £1.50 each, exercisable between 1 July 20x4 and 1 July 20x7, subject to a service condition and certain performance criteria being met in the three years ending 30 June 20x4.

H plc is the grantor of the award, and has the obligation to settle it. On 1 January 20x2, in connection with the award, the H plc group EBT purchases 3,000 shares at the then prevailing market price of £2.00 each, funded by a loan from H plc. On exercise of the option, S Limited is required to pay the differential between the purchase price of the shares and the exercise price of the option (£0.50 per share) to the EBT.

For the purposes of IFRS 2, the options are considered to have a fair value at grant date of £1 per option. Throughout the vesting period of the option, H takes the view that the award will vest in full.

The option is exercised on 1 September 20x6, at which point the EBT uses the option proceeds, together with the payment by S Limited, to repay the loan from H plc.

H plc and its subsidiaries have a 31 December year end.

12.4.1 Consolidated financial statements

So far as the consolidated financial statements are concerned, the transactions to be accounted for are:

- the purchase of the shares by the EBT and their eventual transfer to the employee; and
- the cost of the award.

Transactions between H plc or S Limited and the EBT are ignored since, in this Example, the EBT is consolidated (see 12.3 above). The accounting entries required are set out below. As in other examples in this chapter, where an entry is shown as being made to equity the precise allocation to a particular component of equity will be a matter for local legislation and, possibly, local accounting 'tradition', to the extent that this is not incompatible with IFRS.

		£	£
y/e 31.12.20x1	Profit or loss (employee costs)*	500	
	Equity		500
1.1.20x2	Own shares (equity)	6,000	
	Cash		6,000
y/e 31.12.20x2	Profit or loss (employee costs)*	1,000	
	Equity		1,000
y/e 31.12.20x3	Profit or loss (employee costs)*	1,000	
	Equity		1,000
y/e 31.12.20x4	Profit or loss (employee costs)*	500	
	Equity		500
1.9.20x6	Cash (option proceeds)†	4,500	
	Equity‡	1,500	
	Own shares (equity)**		6,000

* Total cost £3,000 (3000 options × £1) spread over 36 months. Charge for period to December 20x1 is 6/36 × £3,000 = £500, and so on. In practice, where options are granted to a group of individuals, or with variable performance criteria, the annual charge will be based on a continually revised cumulative charge (see further discussion at 6.1 to 6.4 above).

† 3,000 options at £1.50 each.

‡ This reflects the fact that the overall effect of the transaction for the group *in cash terms* has been a 'loss' of £1,500 (£6,000 original cost of shares less £4,500 option proceeds received). However, under IFRS this is an equity transaction, not an expense.

** £6,000 cost of own shares purchased on 1 January 20x2 now transferred to the employee. In practice, it is more likely that the appropriate amount to be transferred would be based on the weighted average price of shares held by the EBT at the date of exercise, as in Example 34.50 at 12.3.3 above. In such a case there would be a corresponding adjustment to the debit to equity marked with ‡ above.

12.4.2 Parent

The accounting by the parent will depend on how the EBT is treated (i.e. whether it is accounted for as a separate entity or as an extension of the parent – see 12.3 above for guidance). The parent should apply the accounting set out in the appropriate section below:

- EBT treated as separate entity (see 12.4.2.A below); and
- EBT treated as extension of parent (see 12.4.2.B below).

We also discuss, at 12.4.2.C below, the accounting implications if the parent, rather than – as in Example 34.53 – a subsidiary, is the employing entity.

12.4.2.A Accounting by parent where subsidiary is the employing entity and EBT is treated as separate entity

The parent accounts for the share-based payment transaction under IFRS 2 as an equity-settled transaction, since the parent settles the award by delivering its own equity instruments to the employees of the subsidiary (see 12.2.4 above). However, as discussed at 12.2.4 above, instead of recording a cost, as in its consolidated financial statements, the parent records an increase in the carrying value of its investment in subsidiary. It might then be necessary to consider whether the ever-increasing investment in subsidiary is supportable or is in fact impaired. As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this example. Any impairment charge would be recorded in profit or loss.

In addition to accounting for the share-based payment transaction, the parent records its transactions with the EBT and the purchase of shares.

This gives rise to the following entries:

		£	£
y/e 31.12.20x1	Investment in subsidiary*	500	
	Equity		500
1.1.20x2	Loan to EBT	6,000	
	Cash		6,000
y/e 31.12.20x2	Investment in subsidiary*	1,000	
	Equity		1,000
y/e 31.12.20x3	Investment in subsidiary*	1,000	
	Equity		1,000
y/e 31.12.20x4	Investment in subsidiary*	500	
	Equity		500
1.9.20x6	Cash	6,000	
	Loan to EBT		6,000

* Total increase in investment £3,000 (3000 shares × £1 fair value of each option) recognised over 36 months. Increase during period to December 20x1 is 6/36 × £3,000 = £500, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual adjustment would be based on a continually revised cumulative adjustment (see further discussion at 6.1 to 6.4 above).

12.4.2.B Accounting by parent where subsidiary is the employing entity and EBT is treated as extension of the parent

The parent accounts for the share-based payment transaction under IFRS 2 as an equity-settled transaction, since the parent settles the award by delivering its own equity instruments to the employees of the subsidiary (see 12.2.4 above). However, as discussed at 12.2.4 above, instead of recording a cost, as in its consolidated financial statements, the parent records an increase in the carrying value of its investment in subsidiary. It might then be necessary to consider whether the ever-increasing investment in subsidiary is supportable or is in fact impaired. As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this example. Any impairment charge would be recorded in profit or loss.

In addition to accounting for the share-based payment transaction, the parent records the transactions of the EBT and the purchase of shares.

This gives rise to the following entries:

		£	£
y/e 31.12.20x1	Investment in subsidiary*	500	
	Equity		500
1.1.20x2	Own shares (equity)	6,000	
	Cash		6,000
y/e 31.12.20x2	Investment in subsidiary*	1,000	
	Equity		1,000
y/e 31.12.20x3	Investment in subsidiary*	1,000	
	Equity		1,000
y/e 31.12.20x4	Investment in subsidiary*	500	
	Equity		500
1.9.20x6	Cash†	6,000	
	Equity‡	1,500	
	Profit or loss§		1,500
	Own shares** (equity)		6,000

* Total increase in investment £3,000 (3000 shares × £1 fair value of each option) spread over 36 months. Increase during period to December 20x1 is 6/36 × £3,000 = £500, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual adjustment would be based on a continually revised cumulative adjustment (see further discussion at 6.1 to 6.4 above).

† £4,500 option exercise proceeds from employee plus £1,500 contribution from S Limited.

‡ This is essentially a balancing figure representing the fact that the entity is distributing own shares with an original cost of £6,000, but has treated £1,500 of the £6,000 of the cash it has received as income (see § below) rather than as payment for the shares.

§ The £1,500 contribution by the subsidiary to the EBT has been treated as a distribution from the subsidiary (see 12.2.7 above) and recorded in profit or loss. It might then be necessary to consider whether, as a result of this payment, the investment in the subsidiary had become impaired (see Chapter 8 at 2.4). As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this example. Any impairment charge would be recorded in profit or loss.

** £6,000 cost of own shares purchased on 1 January 20x2 now transferred to employee. In practice, it is more likely that the appropriate amount to be transferred would be based on the weighted average price of shares held by the EBT at the date of exercise, as in Example 34.50 at 12.3.3 above.

12.4.2.C Parent company as employing entity

If, in Example 34.53, the employing entity were the parent rather than the subsidiary, it would record an expense under IFRS 2. It would also normally waive £1,500 of its £6,000 loan to the EBT (i.e. the shortfall between the original loan and the £4,500 option proceeds received from the employee).

If the EBT is treated as an extension of the parent, the accounting entries for the parent would be the same as those for the group, as set out in 12.4.1 above.

If the EBT is treated as a separate entity, the accounting entries might be as follows:

		£	£
y/e 31.12.20x1	Profit or loss*	500	
	Equity		500
1.1.20x2	Loan to EBT	6,000	
	Cash		6,000
y/e 31.12.20x2	Profit or loss*	1,000	
	Equity		1,000
y/e 31.12.20x3	Profit or loss*	1,000	
	Equity		1,000
y/e 31.12.20x4	Profit or loss*	500	
	Equity		500
1.9.20x6	Own shares (Equity)†	1,500	
	Cash	4,500	
	Loan to EBT		6,000
	Equity	1,500	
	Own shares (Equity)		1,500

* Total cost £3,000 (3000 options × £1) spread over 36 months. Charge for period to December 20x1 is 6/36 × £3,000 = £500, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion at 6.1 to 6.4 above).

† This takes the approach of treating the parent as having a gross-settled purchased call option over its own equity (see Example 34.52 at 12.3.4 above), under which it can acquire 3,000 own shares from the EBT for the consideration of the waiver of £1,500 of the original £6,000 loan. The £4,500 cash inflow represents the £4,500 option exercise proceeds received by the EBT from the employee, which is then used to pay the balance of the original £6,000 loan.

12.4.3 Employing subsidiary

The employing subsidiary is required to account for the IFRS 2 expense and the contribution to the EBT on exercise of the award. This gives rise to the accounting entries set out below. The entries to reflect the IFRS 2 expense are required by IFRS 2 (see 12.2.3 above). The contribution to the EBT is treated as a distribution (see 12.2.7 above).

		£	£
y/e 31.12.20x1	Profit or loss*	500	
	Equity		500
y/e 31.12.20x2	Profit or loss*	1,000	
	Equity		1,000
y/e 31.12.20x3	Profit or loss*	1,000	
	Equity		1,000
y/e 31.12.20x4	Profit or loss*	500	
	Equity		500
1.9.20x6	Equity†	1,500	
	Cash		1,500

* Total cost £3,000 (3000 options × £1) spread over 36 months. Charge for period to December 20x1 is 6/36 × £3,000 = £500, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion at 6.1 to 6.4 above).

† This should be treated as a reduction of whatever component of equity was credited with the £3,000 quasi-contribution from the parent in the accounting entries above.

12.5 Illustrative example of group share scheme – equity-settled award satisfied by fresh issue of shares

Such schemes raise slightly different accounting issues. Again, these are most easily illustrated by way of an example. The discussion in 12.5.1 to 12.5.3 below is based on Example 34.54. As with Example 34.53 at 12.4 above, this section addresses the accounting treatment for three distinct aspects of a group share scheme – a share-based payment arrangement involving group entities (see 12.2 above), the use of an EBT (see 12.3 above) and a group recharge arrangement (see 12.2.7 above).

This illustrative example treats the recharge by the parent to the subsidiary as an income statement credit in the individual accounts of the parent and recognises the recharge when it is paid. In some situations, entities might consider it appropriate to apply alternative accounting treatments (see 12.2.7 above).

Example 34.54: Group share scheme (fresh issue of shares)

On 1 July 20x1 an employee of S Limited, a subsidiary of the H plc group, is awarded options under the H group share scheme over 3,000 shares in H plc at £1.50 each, exercisable between 1 July 20x4 and 1 July 20x7, subject to a service condition and certain performance criteria being met in the three years ending 30 June 20x4. The fair value of the options on 1 July 20x1 is £1 each.

H plc grants the award and has the obligation to settle it.

When preparing accounts during the vesting period H plc and its subsidiaries assume that the award will vest in full. The options are finally exercised on 1 September 20x6, at which point H plc issues 3,000 new shares to the EBT at the then current market price of £3.50 for £10,500. The EBT funds the purchase using the £4,500 option proceeds received from the employee together with £6,000 contributed by S Limited, effectively representing the fair value of the options at exercise date (3,000 × [£3.50 – £1.50]).

H plc and its subsidiaries have a 31 December year end.

12.5.1 Consolidated financial statements

The consolidated financial statements need to deal with:

- the charge required by IFRS 2 in respect of the award; and
- the issue of shares.

Transactions between H plc or S Limited and the EBT are ignored since, in this Example, the EBT is consolidated (see 12.3 above). The accounting entries required are set out below. As in other examples in this chapter, where an entry is shown as being made to equity, the precise allocation to a particular component of equity will be a matter for local legislation and, possibly, local accounting 'tradition', to the extent that this is not incompatible with IFRS.

		£	£
y/e 31.12.20x1	Profit or loss*	500	
	Equity		500
y/e 31.12.20x2	Profit or loss*	1,000	
	Equity		1,000
y/e 31.12.20x3	Profit or loss*	1,000	
	Equity		1,000
y/e 31.12.20x4	Profit or loss*	500	
	Equity		500
1.9.20x6	Cash	4,500	
	Equity†		4,500

* Total cost £3,000 (3000 options × £1) spread over 36 months. Charge for period to December 20x1 is 6/36 × £3,000 = £500, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion at 6.1 to 6.4 above).

† From the point of view of the consolidated group, the issue of shares results in an increase in net assets of only £4,500 (i.e. the exercise price received from the employee), since the £6,000 contribution from the employing subsidiary to the EBT is an intragroup transaction. However, it may be that, in certain jurisdictions, the entity is required to increase its share capital and share premium (additional paid in capital) accounts by the £10,500 legal consideration for the issue of shares. In that case, this entry would be expanded as below, which effectively treats the £6,000 consideration provided from within the group as a bonus issue.

		£	£
1.9.20x6	Cash	4,500	
	Other equity	6,000	
	Share capital/premium		10,500

12.5.2 Parent

The accounting by the parent will depend on how the EBT is treated (i.e. whether it is accounted for as a separate entity or as an extension of the parent – see 12.3 above for guidance). The parent should apply the accounting set out in the appropriate section below:

- EBT treated as separate entity (see 12.5.2.A below); and
- EBT treated as extension of parent (see 12.5.2.B below).

We also discuss, at 12.5.2.C below, the accounting implications if the parent, rather than – as in Example 34.54 – a subsidiary, is the employing entity.

12.5.2.A *Accounting by parent where subsidiary is the employing entity and EBT is treated as separate entity*

The parent accounts for the share-based payment transaction under IFRS 2 as an equity-settled transaction, since the parent settles the award by delivering its own equity instruments, via its EBT, to the employees of the subsidiary (see 12.2.4 above). However, as discussed at 12.2.4 above, instead of recording a cost, as in its consolidated financial statements, the parent records an increase in the carrying value of its investment in subsidiary. It might then be necessary to consider whether the ever-increasing investment in subsidiary is supportable or is in fact impaired. As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this example. Any impairment charge would be recorded in profit or loss.

In addition to accounting for the share-based payment transaction, the parent records its transactions with the EBT and the issue of shares.

		£	£
y/e 31.12.20x1	Investment in subsidiary*	500	
	Equity		500
y/e 31.12.20x2	Investment in subsidiary*	1,000	
	Equity		1,000
y/e 31.12.20x3	Investment in subsidiary*	1,000	
	Equity		1,000
y/e 31.12.20x4	Investment in subsidiary*	500	
	Equity		500
1.9.20x6	Cash†	10,500	
	Share capital/premium		10,500

* Total increase in investment £3,000 (3000 shares × £1 fair value of each option), recognised over 36 months. Increase in period to December 20x1 is 6/36 × £3,000 = £500, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual adjustment would be based on a continually revised cumulative adjustment (see further discussion at 6.1 to 6.4 above).

† £10,500 from EBT (which has received £4,500 option exercise proceeds from employee plus £6,000 contribution from the subsidiary).

12.5.2.B *Accounting by parent where subsidiary is the employing entity and EBT is treated as extension of parent*

The parent accounts for the share-based payment transaction under IFRS 2 as an equity-settled transaction, since the parent settles the award by delivering its own equity instruments, via its EBT, to the employees of the subsidiary (see 12.2.4 above). However, as discussed at 12.2.4 above, instead of recording a cost, as in its consolidated financial statements, the parent records an increase in the carrying value of its investment in subsidiary. It might then be necessary to consider whether the ever-increasing investment in subsidiary is supportable or is in fact impaired. As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this example. Any impairment charge would be recorded in profit or loss.

In addition to accounting for the share-based payment transaction, the parent records the transactions of the EBT and the issue of shares.

		£	£
y/e 31.12.20x1	Investment in subsidiary*	500	
	Equity		500
y/e 31.12.20x2	Investment in subsidiary*	1,000	
	Equity		1,000
y/e 31.12.20x3	Investment in subsidiary*	1,000	
	Equity		1,000
y/e 31.12.20x4	Investment in subsidiary*	500	
	Equity		500
1.9.20x6	Cash†	10,500	
	Equity‡	6,000	
	Profit or loss**		6,000
	Share capital/premium		10,500

* Total increase in investment £3,000 (3000 shares × £1 fair value of each option) spread over 36 months. Increase during period to December 20x1 is 6/36 × £3,000 = £500, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual adjustment would be based on a continually revised cumulative adjustment (see further discussion at 6.1 to 6.4 above).

† £4,500 option exercise proceeds from employee plus £6,000 contribution from the subsidiary.

‡ This assumes that local law requires the entity to record share capital and share premium (additional paid-in capital) of £10,500, as in 12.5.2.A above. However, IFRS *prima facie* requires the £6,000 cash received by the EBT from the subsidiary to be treated as income (see ** below) rather than as part of the proceeds of the issue of shares. In order, in effect, to reconcile these conflicting analyses, £6,000 of the £10,500 required by law to be capitalised as share capital and share premium has been treated as an appropriation out of other equity.

** The £6,000 contribution by the subsidiary to the EBT has been treated as a distribution from the subsidiary (see 12.2.7 above) and recorded in profit or loss. It might then be necessary to consider whether, as a result of this payment, the investment in the subsidiary had become impaired (see Chapter 8 at 2.4). As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this Example. Any impairment charge would be recorded in profit or loss.

12.5.2.C Parent as employing entity

If, in Example 34.54, the employing entity were the parent rather than the subsidiary, it would clearly have to record an expense under IFRS 2. It would also have to fund the £6,000 shortfall between the option exercise proceeds of £4,500 and the £10,500 issue proceeds of the shares.

If the EBT is treated as an extension of the parent, the accounting entries for the parent would be the same as those for the group, as set out in 12.5.1 above.

In our view, the treatment in 12.5.1 above may also be appropriate for this specific transaction, even where the EBT is treated as a separate entity. The issue of shares requires the parent company to fund the EBT with £6,000 which immediately returns it to the parent, along with the £4,500 received from the employee, in exchange for an issue of shares. Whilst this 'circulation' of the £6,000 might have some significance for legal purposes it is, economically speaking, a non-transaction that could be ignored for accounting purposes under IFRS. It might, however, be relevant, under local law, to the amount of equity shown as share capital and share premium (additional paid-in capital), in which case the expanded entry in 12.5.1 above would be appropriate.

Where, however, the EBT is treated as a separate entity, and the cash used to subscribe for the shares arises from a prior transaction, such as an earlier loan to the EBT, matters are more complicated. Suppose that, during the life of the award under discussion, the company were to advance £50,000 to the EBT for general funding purposes. At that point it would clearly record the entry:

	£	£
Loan to EBT	50,000	
Cash		50,000

Suppose that, on exercise of the option, the EBT were to use some of that cash to fund the parent's 'top up' for the share issue. This effectively impairs the loan by £6,000 and leaves a 'missing debit' indicated by '?' in the journal below:

	£	£
Cash	10,500	
?	6,000	
Loan to EBT		6,000
Share capital/premium		10,500

This looks very much like an impairment loss on the loan required to be reported in profit or loss. On the other hand, it does not resemble a loss in any conventional sense. This suggests that another analysis may be possible.

Example 34.52 at 12.3.4 above addresses the situation where an EBT is pre-funded to enable it to buy the reporting entity's own shares in the market, and those shares are finally delivered to the entity for distribution to employees. Example 34.52 suggests that this could be construed as the execution of a gross-settled purchased call option by the entity.

If that analogy is extended, the present situation could be construed as comprising a back-to-back:

- gross-settled purchased call option (whereby the entity can require the EBT to provide 3,000 shares in return for waiver of £6,000 of its outstanding loan to the EBT), which triggers the exercise of;
- a gross-settled written call option (whereby the EBT can require the entity to issue 3,000 fresh shares for £10,500 to the EBT, so that it can satisfy its obligations to the entity under the purchased call).

If these two call options are accounted for under IAS 32 (see Chapter 47 at 11.2), the write-off of the loan to the EBT can be effectively charged to equity, as follows:

	£	£
Cash	10,500	
Share capital/premium		10,500
Exercise by EBT of written call		
Own shares (Equity)	6,000	
Loan to EBT		6,000
Exercise by entity of purchased call		
Equity (other)	6,000	
Own shares (Equity)		6,000
Issue of shares to employee		

12.5.3 Employing subsidiary

The employing subsidiary is required to account for the IFRS 2 expense and the contribution to the EBT on exercise of the award. This gives rise to the accounting entries set out below. The entries to reflect the IFRS 2 expense are required by IFRS 2 (see 12.2.3 above). The contribution to the EBT is treated as a distribution (see 12.2.7 above).

		£	£
y/e 31.12.20x1	Profit or loss*	500	
	Equity		500
y/e 31.12.20x2	Profit or loss*	1,000	
	Equity		1,000
y/e 31.12.20x3	Profit or loss*	1,000	
	Equity		1,000
y/e 31.12.20x4	Profit or loss*	500	
	Equity		500
1.9.20x6	Equity†	6,000	
	Cash		6,000

* Total cost £3,000 (3000 options × £1) spread over 36 months. Charge for period to December 20x1 6/36 × £3,000 = £500, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion at 6.1 to 6.4 above).

† £3,000 of this payment should be treated as a reduction of whatever component of equity was credited with the £3,000 quasi-contribution from the parent in the accounting entries above. The remaining £3,000 would be treated as a distribution and charged to any appropriate component of equity.

12.6 Illustrative example – cash-settled transaction not settled by the entity receiving goods or services

The discussion in 12.6.1 to 12.6.3 below is based on Example 34.55.

Example 34.55: Cash-settled scheme not settled by receiving entity

On 1 July 20x1 an employee of S Limited, a subsidiary of the H plc group, is awarded a right, exercisable between 1 July 20x4 and 1 July 20x7, to receive cash equivalent to the value of 3,000 shares in H plc at the date on which the right is exercised. Exercise of the right is subject to a service condition and certain performance criteria being met in the three years ending 30 June 20x4. The cash will be paid to the employee not by S, but by H. Throughout the vesting period of the award, H and S take the view that it will vest in full.

The award does in fact vest, and the right is exercised on 1 September 20x6.

The fair value of the award (per share-equivalent) at various relevant dates is as follows:

Date	Fair value £
1.7.20x1	1.50
31.12.20x1	1.80
31.12.20x2	2.70
31.12.20x3	2.40
31.12.20x4	2.90
31.12.20x5	3.30
1.9.20x6	3.50

If the award had been equity-settled (i.e. the employee had instead been granted a right to 3,000 free shares), the grant date fair value of the award would have been £1.50 per share.

H plc and its subsidiaries have a 31 December year end.

12.6.1 Consolidated financial statements

The group has entered into a cash-settled transaction which is accounted for using the methodology discussed at 9.3 above. This gives rise to the following accounting entries:

		£	£
y/e 31.12.20x1	Profit or loss*	900	
	Liability		900
y/e 31.12.20x2	Profit or loss*	3,150	
	Liability		3,150
y/e 31.12.20x3	Profit or loss*	1,950	
	Liability		1,950
y/e 31.12.20x4	Profit or loss*	2,700	
	Liability		2,700
y/e 31.12.20x5	Profit or loss*	1,200	
	Liability		1,200
y/e 31.12.20x6	Profit or loss*	600	
	Liability		600
1.9.20x6	Liability	10,500	
	Cash		10,500

* Charge for period to 31 December 20x1 is 6/36 × 3000 × £1.80 [reporting date fair value] = £900. Charge for year ended 31 December 20x2 is 18/36 × 3000 × £2.70 = £4,050 less £900 charged in 20x1 = £3,150 and so on (refer to Example 34.37 at 9.3.2 above). In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion at 9 above).

12.6.2 Parent

The parent accounts for the share-based payment transaction under IFRS 2 as a cash-settled transaction, since the parent settles the award by delivering cash to the employees of the subsidiary (see 12.2.4 above). However, as discussed at 12.2.4 above, instead of recording a cost, as in its consolidated financial statements, the parent treats the debit entry (including, as a matter of accounting policy choice, any remeasurement of the liability) as an increase in the carrying value of its investment in subsidiary. It might then be necessary to consider whether the ever-increasing investment in subsidiary is supportable or is in fact impaired. As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this example. Any impairment charge would be recorded in profit or loss.

This would result in the following accounting entries.

		£	£
y/e 31.12.20x1	Investment in subsidiary*	900	
	Liability		900
y/e 31.12.20x2	Investment in subsidiary*	3,150	
	Liability		3,150
y/e 31.12.20x3	Investment in subsidiary*	1,950	
	Liability		1,950
y/e 31.12.20x4	Investment in subsidiary*	2,700	
	Liability		2,700
y/e 31.12.20x5	Investment in subsidiary*	1,200	
	Liability		1,200
y/e 31.12.20x6	Investment in subsidiary*	600	
	Liability		600
1.9.20x6	Liability	10,500	
	Cash		10,500

* Increase in investment to 31 December 20x1 is 6/36 × 3000 × £1.80 [reporting date fair value] = £900. Increase for year ended 31 December 20x2 is 18/36 × 3000 × £2.70 = £4,050 less £900 charged in 20x1 = £3,150 and so on (refer to Example 34.37 at 9.3.2 above). In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion at 9 above).

Where the parent entity was also the employing entity (and therefore receiving goods or services), it would apply the same accounting treatment in its separate financial statements as in its consolidated financial statements (see 12.6.1 above).

12.6.3 Employing subsidiary

The employing subsidiary accounts for the transaction as equity-settled, since it receives services, but incurs no obligation to its employees (see 12.2.3 and 12.2.6 above). This gives rise to the following accounting entries.

		£	£
y/e 31.12.20x1	Profit or loss*	750	
	Equity		750
y/e 31.12.20x2	Profit or loss*	1,500	
	Equity		1,500
y/e 31.12.20x3	Profit or loss*	1,500	
	Equity		1,500
y/e 31.12.20x4	Profit or loss*	750	
	Equity		750

* Charge for period to 31 December 20x1 is 6/36 × 3000 × £1.50 [grant date fair value] = £750, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion at 6.1 to 6.4 above).

The effect of this treatment is that, while the group ultimately records a cost of £10,500, the subsidiary records a cost of only £4,500.

However, there may be cases where the subsidiary records a higher cost than the group. This would happen if, for example:

- the award vests, but the share price has fallen since grant date, so that the value of the award at vesting (as reflected in the consolidated financial statements) is lower than the value at grant (as reflected in the subsidiary's financial statements); or
- the award does not actually vest because of a failure to meet a market condition and/or a non-vesting condition (so that the cost is nil in the consolidated financial statements) but is treated by IFRS 2 as vesting in the subsidiary's financial statements, because it is accounted for as equity-settled (see 6.3 and 6.4 above).

12.7 Employee transferring between group entities

It is not uncommon for an employee to be granted an equity-settled share-based payment award while in the employment of one subsidiary in the group, but to transfer to another subsidiary in the group before the award is vested, but with the entitlement to the award being unchanged.

In such cases, each subsidiary measures the services received from the employee by reference to the fair value of the equity instruments at the date those rights to equity instruments were originally granted, and the proportion of the vesting period served by the employee with each subsidiary. *[IFRS 2.B59]*. In other words, for an award with a three-year vesting period granted to an employee of subsidiary A, who transfers to subsidiary B at the end of year 2, subsidiary A will (cumulatively) record an expense of 2/3, and subsidiary B 1/3, of the fair value at grant date. However, any subsidiary required to account for the transaction as cash-settled in accordance with the general principles discussed at 12.2 above accounts for its portion of the grant date fair value and also for any changes in the fair value of the award during the period of employment with that subsidiary. *[IFRS 2.B60]*.

After transferring between group entities, an employee may fail to satisfy a vesting condition other than a market condition, for example by leaving the employment of the group. In this situation each subsidiary adjusts the amount previously recognised in respect of the services received from the employee in accordance with the general principles of IFRS 2 (see 6.1 to 6.4 above). *[IFRS 2.B61]*. This imposes upon the original employing entity the rather curious burden of tracking the service record of its former employees, where the accounting impact is expected to be significant.

12.8 Group reorganisations

Following a group reorganisation, such as the insertion of a new parent entity above an existing group, share-based payment arrangements with employees are often amended or replaced so that they relate to the shares of the new parent. Group reorganisations of entities under common control are not within the scope of IFRS 3 and so the requirements set out at 11 above are not directly applicable.

In some cases, the terms and conditions of a share-based payment arrangement will contain provisions relating to restructuring transactions (see 5.3.8.A above) so that the application of any changes is not necessarily considered to be a modification in IFRS 2 terms. Where no such provision is made, the situation is less clear-cut.

In our view, in the consolidated financial statements, such changes to share-based payments would generally be construed as a cancellation and replacement to which modification accounting could be applied (see 7.4.4 above). However, in most cases, the changes made to the share-based payment awards following a group reorganisation are likely to be such that there is no incremental fair value arising from the cancellation and replacement, the intention being simply to replace like with like.

A subsidiary receiving the services of employees but with no obligation to settle the amended award would continue to apply equity-settled accounting in its own financial statements and, as for the consolidated financial statements, would strictly account for the changes as a cancellation and replacement of the original award. The accounting consequences would be more complicated if the subsidiary itself had an obligation to settle the award in the shares of its new parent, when previously it had had to settle in its own shares, as this would mean a change from equity-settled to cash-settled accounting (see 9.4 above). However, we would expect this to be a rare occurrence in practice (see 12.2.5.B above in relation to the grantor of an award in a situation involving parent and subsidiary entities).

The new parent entity becomes a party to the share-based payment arrangements for the first time and, assuming it has no employees of its own but is considered to have granted and to have the obligation to settle the awards, needs to account for the awards to the employees of its subsidiaries (see 12.2.4 and 12.2.5 above). The requirements of IFRS 2 in this situation are unclear and one could argue:

- either that this is a new award by the parent and so should be valued as at the date of the new award; or
- in accordance with the general principle that there is no overall change as a consequence of a reorganisation of entities under common control, that the parent should use the same (original grant date) fair value as the subsidiary.

In our view, either approach is acceptable provided it is applied consistently.

12.9 Share-based payments to employees of joint ventures or associates

The majority of share-based payment transactions with employees involve payments to employees of the reporting entity or of another entity in the same group. Occasionally, however, share-based payments may be made to employees of significant investees of the reporting entity such as joint ventures or associates. For example, if one party to a joint venture is a quoted entity and the other not, it might be commercially appropriate for the quoted venturer to offer payments based on its quoted shares to employees of the joint venture, while the unquoted party contributes to the venture in other ways.

Such arrangements raise some questions of interpretation of IFRS 2, as illustrated by Example 34.56 below. References to an associate in the example and discussions below should be read as also referring to a joint venture.

Example 34.56: Share-based payment to employees of associate

At the beginning of year 1, an entity grants an award of free shares with a fair value at that date of €600,000 to employees of its 40% associate. The shares vest over a three-year period. It is assumed throughout the vesting period of the award that it will vest in full, which is in fact the case.

12.9.1 Financial statements of the associate or joint venture

For the financial statements of the associate, the transaction does not strictly fall within the scope of IFRS 2. In order for a transaction to be in the scope of IFRS 2 for a reporting entity, it must be settled in the equity of the entity itself, or that of another member of the same group. A group comprises a parent and its subsidiaries (see Chapter 6 at 2.2), and does not include associates.

Nevertheless, we believe that it would be appropriate for the associate to account for the transaction as if it did fall within the scope of IFRS 2 by applying the 'GAAP hierarchy' in IAS 8 – *Accounting Policies, Changes in Accounting Estimates and Errors* (see Chapter 3 at 4.3). The investor has effectively made a capital contribution to the associate (in the form of the investor's own equity), no less than if it made a capital contribution in cash which was then used to pay employees of the associate.

If the investor in the associate had instead granted an award settled in the equity of the associate, the transaction would have been in the scope of IFRS 2 for the associate, as being the grant of an award over the equity of the reporting entity by a shareholder of that entity (see 2.2.2.A above).

If the award is, or is treated as being, within the scope of IFRS 2 for the associate, the following entries are recorded:

		€000	€000
Year 1	Employee costs†	200	
	Equity		200
Year 2	Employee costs	200	
	Equity		200
Year 3	Employee costs	200	
	Equity		200

† Grant date fair value of award €600,000 × 1/3. The credit to equity represents a capital contribution from the investor.

12.9.2 Consolidated financial statements of the investor

The investor has entered into a share-based payment transaction since it has granted an award over its equity to third parties (the employees of the associates) in exchange for their services to a significant investee entity. However, employees of an associate are not employees of a group entity and are therefore not employees of the investor's group.

The issue for IFRS 2 purposes is, therefore, whether the award should be regarded as being made to persons providing similar services to employees (and therefore measured at grant date) or to persons other than employees or those providing similar services to employees (and therefore measured at service date) – see 5.2 to 5.4 above.

In our view, it is more appropriate to regard such awards as made to persons providing similar services to employees and therefore measured at grant date.

There are then, we believe, two possible approaches to the accounting. In our view, in the absence of clear guidance in the standard, an entity should choose the more appropriate approach based on the specific circumstances.

In any event, the investor's consolidated financial statements must show a credit to equity of €200,000 a year over the vesting period. The accounting issue is the analysis of the corresponding debit.

It seems clear that the investor must as a minimum recognise an annual cost of €80,000 (40% of €200,000), as part of its 'one-line' share of the result of the associate. The issue then is whether it should account for the remaining €120,000 as a further cost or as an increase in the cost of its investment in its associate.

The argument for treating the €120,000 as an expense is that the associate will either have recorded nothing or, as set out in 12.9.1 above, an entry that results in no net increase in the equity of the associate. Therefore there has been no increase in the investor's share of the net assets of the associate, and there is no basis for the investor to record an increase in its investment. This is broadly the approach required under US GAAP (although US GAAP requires the associate itself to recognise the expense and a corresponding capital contribution applying the grant date measurement model of ASC 718).

It may be possible to conclude in some situations that the €120,000 is an increase in the cost of the investment in associate. IAS 28 – *Investments in Associates and Joint Ventures* – defines the equity method of accounting as (emphasis added):

> 'a method of accounting whereby the investment is *initially recognised at cost and adjusted thereafter* for the post-acquisition change in the investor's share of the investee's net assets'. *[IAS 28.3]*.

For example, there may be cases where another shareholder has made, or undertaken to make, contributions to the associate that are not reflected in its recognised net assets (such as an undertaking to provide knowhow or undertake mineral exploration).

Where an entity takes the view that the €120,000 is an increase in the cost of its investment, it is essential to ensure that the resulting carrying value of the investment is sustainable. This may be the case if, for example:

- the fair value of the investment in the associate exceeds its carrying amount; or
- the investor has agreed to enter into the transaction while another major shareholder has agreed to bear equivalent costs.

In other circumstances, the carrying amount of the investment may not be sustainable, and the investor may need to recognise an impairment of its investment in accordance with IAS 36 (see Chapter 20).

12.9.3 Separate financial statements of the investor

The discussion below assumes that the investor accounts for its investment in the associate at cost in its separate financial statements (see Chapter 8).

The issues here are much the same as in 12.9.2 above. The investor has clearly entered into a share-based payment transaction since it has granted an award over its equity to third parties (the employees of the associates) in exchange for their services to a significant investee entity. As in 12.9.2 above, we believe that this is most appropriately characterised as a transaction with persons providing similar services to employees and therefore measured at its grant date fair value.

In any event, the investor's separate financial statements must show a credit to equity of €200,000 a year over the vesting period but, as in 12.9.2 above, the analysis of the debit entry is more complex.

13 DISCLOSURES

IFRS 2 requires three main groups of disclosures, explaining:

- the nature and extent of share-based payment arrangements (see 13.1 below);
- the valuation of share-based payment arrangements (see 13.2 below); and
- the impact on the financial statements of share-based payment transactions (see 13.3 below).

All of the disclosure requirements of IFRS 2 are subject to the overriding materiality considerations of IAS 1 (see Chapter 3 at 4.1.5). However, depending on the identity of the counterparty and whether, for example, the individual is a member of key management, it will be necessary to assess whether an arrangement is material by nature even if it is immaterial in monetary terms.

13.1 Nature and extent of share-based payment arrangements

IFRS 2 requires an entity to 'disclose information that enables users of the financial statements to understand the nature and extent of share-based payment arrangements that existed during the period'. *[IFRS 2.44]*.

In order to satisfy this general principle, the entity must disclose at least:

(a) a description of each type of share-based payment arrangement that existed at any time during the period, including the general terms and conditions of each arrangement, such as vesting requirements, the maximum term of options granted, and the method of settlement (e.g. whether in cash or equity). An entity with substantially similar types of share-based payment arrangements may aggregate this information, unless separate disclosure of each arrangement is necessary to satisfy the general principle above;

(b) the number and weighted average exercise prices of share options for each of the following groups of options:
  (i) outstanding at the beginning of the period;
  (ii) granted during the period;
  (iii) forfeited during the period;
  (iv) exercised during the period;
  (v) expired during the period;
  (vi) outstanding at the end of the period; and
  (vii) exercisable at the end of the period;

(c) for share options exercised during the period, the weighted average share price at the date of exercise. If options were exercised on a regular basis throughout the period, the entity may instead disclose the weighted average share price during the period; and

(d) for share options outstanding at the end of the period, the range of exercise prices and weighted average remaining contractual life. If the range of exercise prices is wide, the outstanding options must be divided into ranges that are meaningful for assessing the number and timing of additional shares that may be issued and the cash that may be received upon exercise of those options. *[IFRS 2.45]*.

The reconciliation in (b) above should, in our view, reflect all changes in the number of equity instruments outstanding. In addition to awards with a grant date during the period, the reconciliation should include subsequent additions to earlier grants e.g. options or shares added to the award in recognition of dividends declared during the period (where this is part of the original terms of the award), and changes to the number of equity instruments as a result of demergers, share splits or consolidations and other similar changes.

The following extract from the financial statements of Dairy Crest Group plc shows additional awards from the reinvestment of dividends within the reconciliation of outstanding awards.

Extract 34.1: Dairy Crest Group plc (2018)

Notes to the financial statements [extract]

27 Share-based payment plans [extract]

The number of share options and weighted average exercise price for each of the principal schemes is set out as follows:

	LTAP*	TIA*	DBP*	LTISP*	Sharesave Scheme	
	number	number	number	number	number	weighted average exercise price (pence)
Options outstanding at 1 April 2017	1,071,194	262,374	73,533	130,393	941,136	431.1
Options granted during the year	217,007	–	–	–	–	–
Reinvested dividends	71,116	10,495	2,782	5,186	–	–
Options exercised during the year	(86,465)	–	–	(6,959)	(344,027)	377.2
Options forfeited during the year	–	(9,017)	–	–	(70,241)	456.6
Options outstanding at 31 March 2018	**1,272,852**	**263,852**	**76,315**	**128,620**	**526,868**	**462.8**
Exercisable at 31 March 2018	**73,188**	**263,852**	**76,315**	**128,620**	**957**	**–**

[...]

*LTAP, TIA, DBP and LTISP options are nil cost options.

As drafted, the requirements in (b) to (d) above appear to apply only to share options. However, since there is little distinction in IFRS 2 between the treatment of an option with a zero exercise price and the award of a free share, in our view the disclosures should not be restricted to awards of options.

13.2 Valuation of share-based payment arrangements

IFRS 2 requires an entity to 'disclose information that enables users of the financial statements to understand how the fair value of the goods or services received, or the fair value of the equity instruments granted, during the period was determined'. *[IFRS 2.46]*.

As drafted, this requirement, and some of the detailed disclosures below, appears to apply only to equity-settled transactions. However, it would be anomalous if detailed disclosures were required about the valuation of an award to be settled in shares, but not one to be settled in cash. In our view, therefore, the disclosures apply both to equity-settled and to cash-settled transactions.

If the entity has measured the fair value of goods or services received as consideration for equity instruments of the entity indirectly, by reference to the fair value of the equity instruments granted (i.e. transactions with employees and, in exceptional cases only, with non-employees), the entity must disclose at least the following:

(a) for share options granted during the period, the weighted average fair value of those options at the measurement date and information on how that fair value was measured, including:
  - (i) the option pricing model used and the inputs to that model, including the weighted average share price, exercise price, expected volatility, option life, expected dividends, the risk-free interest rate and any other inputs to the model, including the method used and the assumptions made to incorporate the effects of expected early exercise;
  - (ii) how expected volatility was determined, including an explanation of the extent to which expected volatility was based on historical volatility; and
  - (iii) whether and how any other features of the option grant were incorporated into the measurement of fair value, such as a market condition;

(b) for other equity instruments granted during the period (i.e. other than share options), the number and weighted average fair value of those equity instruments at the measurement date, and information on how that fair value was measured, including:
  - (i) if fair value was not measured on the basis of an observable market price, how it was determined;
  - (ii) whether and how expected dividends were incorporated into the measurement of fair value; and
  - (iii) whether and how any other features of the equity instruments granted were incorporated into the measurement of fair value;

(c) for share-based payment arrangements that were modified during the period:
  - (i) an explanation of those modifications;
  - (ii) the incremental fair value granted (as a result of those modifications); and
  - (iii) information on how the incremental fair value granted was measured, consistently with the requirements set out in (a) and (b) above, where applicable. *[IFRS 2.47]*.

These requirements can be seen to some extent as an anti-avoidance measure. It would not be surprising if the IASB had concerns that entities might seek to minimise the impact of IFRS 2 by using unduly pessimistic assumptions that result in a low fair value for share-based payment transactions, and the disclosures above seem designed to deter entities from doing so. However, these disclosures give information about other commercially sensitive matters. For example, (a)(i) above effectively requires disclosure of future dividend policy for a longer period than is generally covered by such forecasts. Entities may need to consider the impact on investors and analysts of dividend yield assumptions disclosed under IFRS 2.

In our view, it is important for entities, in making these disclosures, to ensure that any assumptions disclosed, particularly those relating to future performance, are consistent with those used in other areas of financial reporting that rely on estimates of future events, such as the impairment of property, plant and equipment, intangible assets and goodwill, income taxes (recovery of deferred tax assets out of future profits) and pensions and other post-retirement benefits.

If the entity has measured a share-based payment transaction directly by reference to the fair value of goods or services received during the period, the entity must disclose how that fair value was determined (e.g. whether fair value was measured at a market price for those goods or services). *[IFRS 2.48]*.

As discussed at 5.4 above, IFRS 2 creates a rebuttable presumption that, for an equity-settled transaction with a counterparty other than an employee, the fair value of goods and services received provides the more reliable basis for assessing the fair value of the transaction. Where the entity has rebutted this presumption, and has valued the transaction by reference to the fair value of equity instruments issued, it must disclose this fact, and give an explanation of why the presumption was rebutted. *[IFRS 2.49]*.

13.3 Impact of share-based payment transactions on financial statements

IFRS 2 requires an entity to 'disclose information that enables users of the financial statements to understand the effect of share-based payment transactions on the entity's profit or loss for the period and on its financial position.' *[IFRS 2.50]*.

In order to do this, it must disclose at least:

(a) the total expense recognised for the period arising from share-based payment transactions in which the goods or services received did not qualify for recognition as assets and hence were recognised immediately as an expense, including separate disclosure of that portion of the total expense that arises from transactions accounted for as equity-settled share-based payment transactions;

(b) for liabilities arising from share-based payment transactions:

  (i) the total carrying amount at the end of the period; and

  (ii) the total intrinsic value at the end of the period of liabilities for which the counterparty's right to cash or other assets had vested by the end of the period (e.g. vested share appreciation rights). *[IFRS 2.51]*.

The disclosures section of IFRS 2 has a final paragraph requiring an entity to disclose additional information about its share-based payments should the information requirements set out above and at 13.1 and 13.2 above be insufficient to meet the general disclosure principles of the standard. *[IFRS 2.52]*.

As an example of such additional disclosure, IFRS 2 says that if an entity has classified any share-based payment transactions as equity-settled when there is a net settlement feature for withholding tax obligations (see 14.3.1 below), it should disclose the estimated future payment to the tax authority when it is necessary to inform users of the financial statements about the future cash flow effects of a share-based payment arrangement. *[IFRS 2.52]*.

13.4 Example of IFRS 2 disclosures

An example of many of the disclosures required by IFRS 2 may be found in the financial statements of Aviva plc for the year ended 31 December 2018.

Extract 34.2: Aviva plc (2018)

Notes to the consolidated financial statements [extract]

33 – Group's share plans

This note describes various equity compensation plans operated by the Group, and shows how the Group values the options and awards of shares in the Company.

(a) Description of the plans

The Group maintains a number of active share option and award plans and schemes (the Group's share plans). These are as follows:

(i) Savings-related options

These are options granted under the tax-advantaged Save As You Earn (SAYE) share option scheme in the UK and Irish revenue-approved SAYE share option scheme in Ireland. The SAYE allows eligible employees to acquire options over the Company's shares at a discount of up to 20% of their market value at the date of grant.

Options are normally exercisable during the six month period following either the third or fifth anniversary of the start of the relevant savings contract. Seven year contracts were offered prior to 2012. Savings contracts are subject to the statutory savings limits of £500 per month in the UK and €500 per month in Ireland. A limit of £250 per month was applied to contracts in the UK prior to 2016.

(ii) Aviva long-term incentive plan awards

These awards have been made under the Aviva Long-Term Incentive Plan 2011 (LTIP), and are described in section (b) below and in the directors' remuneration report.

(iii) Aviva annual bonus plan awards

These awards have been made under the Aviva Annual Bonus Plan 2011 (ABP), and are described in section (b) below and in the directors' remuneration report.

(iv) Aviva recruitment and retention share plan awards

These are conditional awards granted under the Aviva Recruitment and Retention Share Award plan (RRSAP) in relation to the recruitment or retention of senior managers excluding executive directors. The awards vest in tranches on various dates and vesting is conditional upon the participant being employed by the Group on the vesting date and not having served notice of resignation. Some awards can be subject to performance conditions. If a participant's employment is terminated due to resignation or dismissal, any tranche of the award which has vested within the 12 months prior to the termination date will be subject to clawback and any unvested tranches of the award will lapse in full.

(v) Aviva Investors deferred share award plan awards

These awards have been made under the Aviva Investors Deferred Share Award Plan (AI DSAP), where employees can choose to have the deferred element of their bonus deferred into awards over Aviva shares. The awards vest in three equal tranches on the second, third and fourth year following the year of grant.

(vi) Aviva Investors long-term incentive plan awards

These awards have been made under the Aviva Investors Long-Term Incentive Plan (AI LTIP)

(vii) Various all employee share plans

The Company maintains a number of active stock option and share award voluntary schemes:

a) The global matching share plan
b) Aviva Group employee share ownership scheme
c) Aviva France employee profit sharing scheme.

No new Aviva plc ordinary shares will be issued to satisfy awards made under plans iv, v, vi b) or vii c).

(b) Outstanding options and awards

(i) Share options

At 31 December 2018, options to subscribe for ordinary shares of 25 pence each in the Company were outstanding as follows:

Aviva savings related share option scheme	Option price p	Number of shares	Normally exercisable	Option price p	Number of shares	Normally exercisable
	268	145,323	2018	351	10,508,734	2019 or 2021
	312	267,209	2018	409	4,694,393	2020 or 2022
	380	3,856,295	2018 or 2020	387	7,563,395	2021 or 2023
	419	400,885	2019			

Aviva Ireland savings related share option scheme (in euros)	Option price c	Number of shares	Normally exercisable	Option price c	Number of shares	Normally exercisable
	369	8,259	2018	418	436,262	2019 or 2021
	518	107,293	2018 or 2020	447	233,305	2020 or 2022
	527	11,489	2019	432	425,184	2021 or 2023

The following table summarises information about options outstanding at 31 December 2018:

Range of exercise prices	Outstanding options Number	Weighted average remaining contractual life Years	Weighted average exercise price p
£2.66 – £3.16	420,791	1	296.80
£3.17 – £3.67	10,944,996	2	351.00
£3.68 – £4.19	17,292,239	2	392.43

The comparative figures as at 31 December 2017 were:

Range of exercise prices	Outstanding options Number	Weighted average remaining contractual life Years	Weighted average exercise price p
£2.66 – £3.16	960,378	1	288.10
£3.17 – £3.67	12,227,442	3	351.00
£3.68 – £4.19	11,908,758	3	397.83

(ii) Share awards

At 31 December 2018, awards issued under the Company's executive incentive plans over ordinary shares of 25 pence each in the Company were outstanding as follows:

Aviva long-term incentive plan 2011	Number of shares	Year of vesting
	9,151,821	2019
	6,745,024	2020
	7,898,212	2021

Aviva annual bonus plan 2011	Number of shares	Year of vesting
	5,452,009	2019
	2,764,620	2020
	2,008,514	2021

Aviva recruitment and retention share award plan	Number of shares	Year of vesting
	706,643	2019
	268,812	2020
	83,855	2021
	17,269	2022

Aviva investors deferred share award plan	Number of shares	Year of vesting
	101,695	2019
	86,024	2020
	50,300	2021

Aviva Investors long-term incentive plan 2015	Number of shares	Year of vesting
	313,419	2020

The global matching share plan	Number of shares	Year of vesting
	20,421	2019
	682,944	2020
	629,422	2021

The vesting of awards under the LTIP is subject to the attainment of performance conditions as described in the directors' remuneration report.

No performance conditions are attached to the awards under the ABP, AI DSAP or some of the awards under the RRSAP except as outlined below. There are no performance conditions attached to LTIP awards granted since 2017, with the exception of grants made to the Group Executive.

Under the RRSAP, some shares are subject to the attainment of the same performance conditions that apply to the LTIP grants as follows.

- Shares which vest in 2019:
  - 102,602 are subject to the same performance conditions that apply to the 2016 LTIP grant
  - 144,980 are subject to the performance conditions relating to the performance of the participant's previous employer
- Shares which vest in 2020:
  - 53,246 are subject to the performance conditions relating to the performance of the participant's previous employer
- Shares which vest in 2021:
  - 5,305 are subject to the performance conditions relating to the performance of the participant's previous employer

These performance conditions are as outlined in the relevant year's directors' remuneration report. Shares which do not vest will lapse.

(iii) Shares to satisfy awards and options

New issue shares are now generally used to satisfy all awards and options granted under plans that have received shareholder approval and where local regulations permit. Further details are given in note 32.

(c) Movements in the year

A summary of the status of the option plans as at 31 December 2017 and 2018, and changes during the years ended on those dates, is shown below.

	2018		2017	
	Number of options	**Weighted average exercise price p**	Number of options	Weighted average exercise price p
Outstanding at 1 January	**25,096,578**	**370.81**	24,253,209	355.08
Granted during the year	**8,139,367**	**387.00**	5,998,098	409.00
Exercised during the year	**(2,111,514)**	**361.96**	(3,094,372)	327.04
Forfeited during the year	**(1,855,638)**	**385.00**	(944,431)	364.03
Cancelled during the year	**(495,646)**	**364.93**	(1,004,017)	361.90
Expired during the year	**(115,121)**	**381.97**	(111,909)	355.32
Outstanding at 31 December	**28,658,026**	**375.20**	25,096,578	370.81
Exercisable at 31 December	**3,457,732**	**369.88**	911,019	366.51

(d) Expense charged to the income statement

The total expense recognised for the year arising from equity compensation plans were as follows:

	2018 £m	2017 £m
Equity-settled expense	**64**	77
Cash-settled expense	**–**	–
Total (note 11(b))	**64**	77

(e) Fair value of options and awards granted after 7 November 2002

The weighted average fair values of options and awards granted during the year, estimated by using the Binomial option pricing model and Monte Carlo Simulation model, were £0.78 and £4.84 *(2017: £1.00 and £4.94)* respectively.

(i) Share options

The fair value of the options was estimated on the date of grant, based on the following weighted average assumptions:

Weighted average assumption	**2018**	2017
Share price	**480p**	506p
Exercise price	**387p**	409p
Expected volatility	**24.85%**	26.04%
Expected life	**3.67 years**	3.70 years
Expected dividend yield	**5.88%**	4.61%
Risk-free interest rate	**1.05%**	0.55%

The expected volatility used was based on the historical volatility of the share price over a period equivalent to the expected life of the option prior to its date of grant. The risk-free interest rate was based on the yields available on UK government bonds as at the date of grant. The bonds chosen were those with a similar remaining term to the expected life of the options. 2,111,514 options granted after 7 November 2002 were exercised during the year (*2017: 3,094,372*).

(ii) Share awards

The fair value of the awards was estimated on the date of grant based on the following weighted average assumptions:

Weighted average assumption	2018	2017
Share price	**500p**	523p
Expected volatility[1]	**25%**	28%
Expected volatility of comparator companies' share price[1]	**25%**	26%
Correlation between Aviva and comparator competitors' share price[1]	**64%**	59%
Expected life[1]	**2.64 years**	2.76 years
Expected dividend yield[2]	**0.00%**	0.00%
Risk-free interest rate[1]	**0.80%**	0.59%

1 For awards with market-based performance conditions only.

2 Expected dividend yield assumption was only used to fair value LTIP awards issued in France. In 2017, LTIP awards with no market performance conditions were issued in France therefore this assumption was not used in the year.

The expected volatility used was based on the historical volatility of the share price over a period equivalent to the expected life of the share award prior to its date of grant. The risk-free interest rate was based on the yields available on UK government bonds as at the date of grant. The bonds chosen were those with a similar remaining term to the expected life of the share awards.

Depending on the precise regulatory requirements of a particular jurisdiction, it might be possible to meet some of the IFRS 2 disclosure requirements by means of a cross-reference between the financial statements and other parts of an annual report published together with the financial statements, such as a management commentary or statutory remuneration report (as in the case of Aviva plc above). However, even where such an approach is permissible, care needs to be taken to ensure that any such cross-reference is clear and specific and that all of the relevant IFRS 2 requirements have been addressed as these requirements vary depending on when an award was granted. For example, detailed fair value information for an equity-settled award is generally required only in the year of grant (and as comparative information in the following period(s)), whereas the conditions attached to an award are required to be disclosed in every period in which that award is outstanding.

14 TAXES RELATED TO SHARE-BASED PAYMENT TRANSACTIONS

14.1 Income tax deductions for the entity

In many jurisdictions entities are entitled to receive income tax deductions for share-based payment transactions. In many, if not most, cases the tax deduction is given for a cost different to that recorded under IFRS 2. For example, some jurisdictions give a tax deduction for the fair or intrinsic value of the award at the date of exercise; others may give a tax deduction for amounts charged to a subsidiary by its parent, or by a trust controlled by the parent, in respect of the cost of group awards to the employees of that subsidiary. In either case, both the amount and timing of the expense for tax purposes will be different from the amount and timing of the expense required by IFRS 2.

The particular issues raised by share-based payment transactions are addressed in IAS 12 and discussed further in Chapter 33 at 10.8.

14.2 Employment taxes of the employer

It is frequently the case that an employing entity is required to pay employment taxes or social security contributions on share options and other share-based payment transactions with employees, just as if the employees had received cash remuneration. This raises the question of how such taxes should be accounted for.

14.2.1 Applicable standard

The choice of accounting method does not affect the total expense ultimately recognised (which must always be the tax actually paid), but rather its allocation to different accounting periods. IFRS is unclear as to which standard should be applied in accounting for such employment taxes. Some consider that such taxes are most appropriately accounted for under IAS 37 (see 14.2.1.A below), others favour IFRS 2 (see 14.2.1.B below) or IAS 19 (see 14.2.1.C below). A reporting entity may therefore choose what it considers an appropriate policy for employment taxes in its particular circumstances.

Such taxes do not fall within the scope of IFRS 9 since, like income taxes, they are not contractual liabilities (see Chapter 45 at 2.2.1).

14.2.1.A IAS 37

Some consider that, for the reasons set out in 14.2.1.B and 14.2.1.C below, employment taxes of the employer do not fall within the scope of IFRS 2 or of IAS 19. Accordingly, since the amount ultimately payable is uncertain, the most appropriate standard to apply is IAS 37.

Where IAS 37 is applied, the entity will recognise a provision for the employment tax in accordance with IFRIC 21 – *Levies* – which requires identification of the activity that triggers the payment, as identified by the legislation (see Chapter 26 at 3.1 and 6.8). However, there is some room for discussion as to what constitutes the activity that triggers the payment. Is it:

- the granting of the award;
- the consumption of services received from employees;
- the event (typically exercise) that gives rise to a real tax liability; or
- the vesting of the award?

Entities applying IAS 37 need therefore to consider the appropriate treatment of employment taxes in the light of IFRIC 21.

14.2.1.B IFRS 2

Some argue that, since the employment taxes are a payment of an amount of cash typically directly linked to the share price, they should be accounted for as a cash-settled share-based payment transaction under IFRS 2. This would require the taxes to be measured at each reporting date at fair value, multiplied by the expired vesting period of the award to which they relate (see 9.3.1 above).

A difficulty with this analysis is that IFRS 2 defines a cash-settled share-based payment transaction as one in which the entity incurs a liability to the 'supplier of ... goods or services'. The liability for such employment taxes is clearly due to the tax authorities, not to the supplier of goods and services (i.e. the employee). Some who support the application of IFRS 2 accept that IFRS 2 is not directly applicable but argue that it is nevertheless the most appropriate standard to apply under the 'GAAP hierarchy' in IAS 8 (see Chapter 3 at 4.3). The objective of IFRS 2 (see 2.1 above) states that the standard is intended to apply to 'expenses associated with transactions in which share options are granted to employees'. *[IFRS 2.2]*. However, the standard contains no explicit provisions relevant to this objective.

14.2.1.C IAS 19

Some argue that such payments are more appropriately accounted for under IAS 19 (see Chapter 35) especially when the taxes are social security contribution, as such contributions benefit the employee indirectly on retirement. Again the difficulty is that IAS 19 defines employee benefits as 'all forms of consideration given by an entity in exchange for service rendered by employees or for the termination of employment' *[IAS 19.8]* which would appear to rule out payments to the tax authority, but for the fact that IAS 19 refers to social security contributions as a component part of short-term employee benefits. *[IAS 19.9(a)]*. However, many share-based payment transactions would, if they were within the scope of IAS 19, be classified as long-term benefits. That brings the added complication that IAS 19 would require the employment taxes due on long-term benefits to be accounted for, like the benefits themselves, using the projected unit credit method, which seems an unduly complex approach in the circumstances.

In some situations the entity may require employees to discharge any liability for employment taxes. The accounting issues raised by such arrangements are discussed at 14.2.2 and 14.3 below.

14.2.2 Recovery of employer's taxes from employees

As discussed at 14.2 above, in some jurisdictions employers are required to pay employment taxes on share-based payment transactions. This detracts from one of the key attractions for an employer of a share-based payment transaction, namely that it entails no cash cost. This is particularly the case where the tax payable is based on the fair value of the award at vesting, meaning that the employer's liability is potentially unlimited.

Accordingly, employers liable to such taxes will sometimes make it a condition of receiving a share-based award that the employee bear all or some of the employer's cash cost of any related employment taxes. This may be done in a number of ways, including:

- direct payment to the entity;
- authorising the entity to deduct the relevant amount from the employee's salary; or
- surrendering as many shares to the entity as have a fair value equal to the tax liability.

The accounting treatment of arrangements where the recovery of the employer's tax cost from the employee is made through surrendering of a number of shares with an equivalent value is similar to that discussed at 14.3 below for the recovery of the employee's taxes.

Where the scheme requires direct cash reimbursement by employees of the cost of the employer's taxes, different considerations apply, as illustrated by Example 34.57 below.

Example 34.57: Recovery of employment tax on share-based payment from employee

At the beginning of year 1, an entity granted an executive an award of free shares with a fair value of €100,000 on condition that the executive remain in employment for three years. In the jurisdiction concerned, an employment tax at the rate of 12% is payable by the employer when the shares vest, based on their fair value at the date of vesting. As a condition of obtaining the shares on vesting, the executive is required to pay cash equal to the tax liability to the employer.

When the shares vest at the end of year 3, their fair value is €300,000, on which employment taxes of €36,000 are due. The executive pays this amount to the entity.

In our view, this arrangement can be construed in one of two ways, with somewhat different accounting outcomes:

- View 1: The executive's obligation to make whole the employer's tax liability means that this is, economically, not an award of free shares, but an option to acquire the shares for an exercise price equivalent to 12% of their market value at the date of exercise. The employer's tax liability is a separate transaction.
- View 2: The executive's obligation to make whole the employer's tax liability should be accounted for as such, separately from the share-based payment transaction.

In our view, either approach may be adopted, so long as it is applied consistently as a matter of accounting policy. The essential differences between View 1 and View 2, as illustrated below, are that:

- under View 1 the reimbursement received from the employee is credited to equity, whereas under View 2 it is credited to profit or loss; and
- under View 1, the IFRS 2 charge is lower than under View 2 reflecting the fact that under View 1 the award is construed as an option, not an award of free shares.

View 1 Reimbursement treated as exercise price

On this analysis, the award is construed as an option to acquire shares with an exercise price of 12% of the fair value, at vesting, of the shares. The grant date fair value of the award construed as an option is €88,000. The entity would process the following accounting entries (on a cumulative basis).

	€000	€000
Employee costs*	88	
Equity		88
Employee costs†	36	
Cash		36
Cash§	36	
Equity		36

* IFRS 2 charge.

† Employment taxes (12% of €300,000).

§ The receipt of cash from the employee to reimburse the tax is treated as the receipt of the exercise price for an option and credited to equity.

View 2 Reimbursement treated separately from the IFRS 2 charge

On this analysis, the award is construed as an award of free shares, with a grant date fair value of €100,000. The reimbursement is accounted for as such, giving rise to a credit to profit or loss. The entity would process the following accounting entries (on a cumulative basis).

	€000	€000
Employee costs*	100	
Equity		100
Employee costs†	36	
Cash		36
Cash§	36	
Employee costs		36

* IFRS 2 charge.

† Employment taxes (12% of €300,000).

§ The receipt of cash from the employee to reimburse the tax is treated as a reduction in employee costs.

It will be seen that View 1 results in a total employee expense of €124,000, while View 2 results in a total employee expense of €100,000.

14.2.3 Holding of own shares to 'hedge' employment tax liabilities

As noted at 14.2 above, an award of shares or options to an employee may also give rise to an employment tax liability for the employer, often related to the fair value of the award when it vests or, in the case of an option, is exercised. Employers may hold their own shares in order to hedge this liability (in an economic sense, if not under the criteria in IFRS 9 – see 2.2.4.H above), and later sell as many shares as are needed to raise proceeds equal to the tax liability.

These are two separate transactions. The purchase and sale of own shares are treasury share transactions accounted for in accordance with IAS 32 (see Chapter 47 at 9). The accounting treatment of the employment tax liability is discussed at 14.2.1 above.

14.3 Sale or surrender of shares by employee to meet employee's tax liability ('sell to cover' and 'net settlement')

In some jurisdictions, an award of shares or options to an employee gives rise to a personal tax liability for the employee, often related to the fair value of the award when it vests or, in the case of an option, is exercised. In order to meet this tax liability, employees may wish to sell or surrender as many shares as are needed to raise proceeds equal to the tax liability (sometimes described respectively as 'sell to cover' or 'net settlement').

This in itself does not, in our view, require the scheme to be considered as cash-settled, any more than if the employee wished to liquidate the shares in order to buy a car or undertake home improvements. However, if the manner in which the cash is passed to, or realised for, the employee gives rise to a legal or constructive obligation for the employer, then the scheme might well be cash-settled (see 9.2.2 to 9.2.4 above), to the extent of any such obligation.

In some jurisdictions where employees must pay income tax on share awards, the tax is initially collected from (and is a legal liability of) the employer, but with eventual recourse by the tax authorities to the employee for tax not collected from the employer. Such tax collection arrangements mean that even an equity-settled award results in a cash cost for the employer for the income tax.

In such a situation, the employer may require the employee, as a condition of taking delivery of any shares earned, to indemnify the entity against the tax liability, for example by:

- direct payment to the entity;
- authorising the entity to deduct the relevant amount from the employee's salary; or
- surrendering as many shares to the entity as have a fair value equal to the tax liability.

If the entity requires the employee to surrender the relevant number of shares, in our view it is appropriate to treat the scheme as cash-settled to the extent of the indemnified amount, unless the criteria to account for the arrangement as equity-settled under the limited exception in IFRS 2 are met (see further below). This view relating to the general requirements of IFRS 2 was confirmed by the IASB in its discussions relating to the introduction of the exception into the standard. *[IFRS 2.BC255G]*.

IFRS 2 contains a limited exception to the general requirement to consider whether a net-settled arrangement needs to be split into equity-settled and cash-settled portions. An entity is required to account for net-settled arrangements meeting certain specified criteria as equity-settled in their entirety. However, the exception is narrow in scope and the requirement to assess whether an arrangement has an equity-settled element and a cash-settled element continues to be relevant in many cases. The exception is discussed and illustrated further at 14.3.1 below.

The following example illustrates the application of IFRS 2 to an arrangement where the exception does not apply and so the entity has to separate the transaction into two elements.

Example 34.58: Surrendering of vested shares by employee to indemnify liability of entity to pay employee's tax liability (net settlement where IFRS 2 exception does not apply)

An entity operates in a jurisdiction where the personal tax rate is 40%, and free shares are taxed at their fair value on vesting. The entity grants an award of 100 free shares with a grant date fair value of £3 each. The fair value at vesting date is £5, so that the employee's tax liability (required to be discharged in the first instance by the employer) is £200 (40% of £500). The award is to be satisfied using treasury shares with an original cost of £2.50 per share. Tax law or regulation does not require the entity to withhold an amount for the employee's tax obligation (see Example 34.59 below for an illustration of that situation).

The terms of the agreement between the entity and the employee specify that the employee must surrender the 40 shares needed to settle the tax liability. In our view the substance of the transaction is that, at grant date, the entity is making an award of only 60 shares (with a grant date fair value of £3 each) and is bearing the cost of the employment tax itself. On this analysis, the entity will have recorded the following entries by the end of the vesting period:

	£	£
Employee costs (based on 60 shares at grant date fair value)	180	
Equity		180
Employee costs (based on 40% of vesting date value)	200	
Employment tax liability		200

The award is then satisfied by delivery of 60 treasury shares (with a cost of £2.50 each) to the employee:

	£	£
Equity	150	
Treasury shares		150

The entity might well then sell the 40 shares 'surrendered' by the employee in order to raise the cash to pay the tax, but this would be accounted for as an increase in equity on the reissue of treasury shares, not as income (see 14.2.3 above).

If, instead of being required to surrender shares, the employee has a free choice as to how to indemnify the employer, the employer will have recorded the following entries by the end of the vesting period:

	£	£
Employee costs (based on 100 shares at grant date fair value)	300	
Equity		300
Receivable from employee (based on 40% of vesting date value)	200	
Employment tax liability		200

The award is then satisfied by delivery of shares to the employee, and the employee indicates that he wishes to surrender 40 shares to discharge his obligation to the employer under the indemnity arrangement. The entity then receives 40 shares from the employee in settlement of the £200 receivable from him.

In practice, this would almost certainly be effected as a net delivery of 60 shares, but in principle there are two transactions, a release of 100 treasury shares, with a cost of £2.50 each, to the employee:

	£	£
Equity	250	
Treasury shares		250

and the re-acquisition of 40 of those shares at £5 each from the employee:

	£	£
Treasury shares	200	
Receivable from employee		200

The entity then settles the tax liability:

	£	£
Employment tax liability	200	
Cash		200

Even in this case, however, some might take the view that the substance of the arrangement is that the employee has the right to put 40 shares to the employer, and accordingly 40% of the award should be accounted for as cash-settled, resulting in essentially the same accounting as when the employee is required to surrender 40 shares, as set out above. An entity should therefore make a careful assessment of the appropriate accounting treatment based on the terms of a particular arrangement.

14.3.1 Share-based payments with a net settlement feature for withholding tax obligations (net settlement where IFRS 2 exception applies)

IFRS 2 contains an exception for specific types of share-based payment transaction with a net settlement feature.

The exception was introduced as a result of discussions by the Interpretations Committee about the classification of a share-based payment transaction in which an entity withholds a specified portion of shares that would otherwise be issued to the counterparty at the date of exercise or vesting. The shares are withheld in return for the entity settling the counterparty's tax liability relating to the share-based payment. The question asked was whether the portion of the share-based payment that is withheld should be classified as cash-settled or equity-settled in a situation where, in the absence of the net settlement feature, the award would be treated in its entirety as equity-settled?

The exception to the usual requirements of the standard (which are set out at 14.3 above) is narrow in scope and applies only in situations where there is a statutory withholding obligation. The standard explains that 'tax laws or regulations may oblige an entity to withhold an amount for an employee's tax obligation associated with a share-based payment and transfer that amount, normally in cash, to the tax authority on the employee's behalf. To fulfil this obligation, the terms of the share-based payment arrangement may permit or require the entity to withhold the number of equity instruments equal to the monetary value of the employee's tax obligation from the total number of equity instruments that otherwise would have been issued to the employee upon exercise (or vesting) of the share-based payment (i.e. the share-based payment arrangement has a "net settlement feature")'. *[IFRS 2.33E]*.

If a transaction meeting the above criteria would have been classified entirely as equity-settled were it not for this net settlement feature, then the exception in IFRS 2 applies and the transaction is accounted for as equity-settled in its entirety (rather than being divided into an equity-settled portion and a cash-settled portion as discussed at 14.3 above). *[IFRS 2.33F, BC255G-I]*.

An entity applying the exception has to account for the withholding of shares to fund the payment to the tax authority as a deduction from equity (in accordance with paragraph 29 of IFRS 2). However, the deduction from equity may only be made up to the fair value at the net settlement date of the shares required to be withheld. *[IFRS 2.33G]*. If the payment exceeds this fair value, the excess is expensed through profit or loss.

Where the entity withholds any equity instruments in excess of the employee's tax obligation associated with the share-based payment (i.e. the entity withholds an amount of shares that exceeds the monetary value of the employee's tax obligation), then the excess shares should be accounted for as a cash-settled share-based payment when this amount is paid in cash (or other assets) to the employee. *[IFRS 2.33H(b)]*. In other words, such shares are treated as a separate cash-settled share-based payment and fully recognised as an expense (rather than as a deduction from equity) as at the date of settlement.

To illustrate the application of the exception, the IASB has added an example to the implementation guidance accompanying IFRS 2. *[IFRS 2 IG Example 12B]*. The substance of this example is reproduced as Example 34.59 below.

An entity applying the exception will also need to consider whether additional disclosures are needed in respect of the future cash payment to the tax authorities (see 13.3 above). *[IFRS 2.52]*.

The IASB notes in the Basis for Conclusions to IFRS 2 that the exception is designed to alleviate the operational difficulties, and any associated undue cost, encountered by entities when they are required, under the requirements of IFRS 2, to divide a share-based payment transaction into an equity-settled element and a cash-settled element (see 14.3 above). *[IFRS 2.BC255J]*.

The IASB made it very clear during its discussions that the exception only addresses the narrow situation where the net settlement arrangement is designed to meet an entity's obligation under tax laws or regulations to withhold a certain amount to meet the counterparty's tax obligation associated with the share-based payment and transfer that amount in cash to the taxation authorities. This point has been incorporated into IFRS 2 as follows:

'The exception in paragraph 33F does not apply to:

> (a) a share-based payment arrangement with a net settlement feature for which there is no obligation on the entity under tax laws or regulations to withhold an amount for an employee's tax obligation associated with that share-based payment ...'. *[IFRS 2.33H(a)]*.

Other types of arrangement that are very frequently seen in practice might appear similar in substance to the legal or regulatory obligation covered by the exception. For example, as discussed and illustrated at 14.3 above, the terms of a share-based payment arrangement between an entity and an employee might require the employee to forfeit sufficient shares to meet the tax liability or the employee might have some choice over whether or not shares are withheld and/or directly sold in order to raise cash to settle the tax liability. However, unless the arrangements for net settlement are put in place to meet the entity's obligation under tax laws or regulations as described above, the exception will not apply. Therefore, careful analysis of such arrangements continues to be necessary to determine whether part of the award should be treated as cash-settled or whether the exception applies and the entire arrangement should therefore be treated as equity-settled.

Example 34.59: Share-based payment transactions with a net settlement feature for withholding tax obligations (application of IFRS 2 exception)

At the beginning of year 1 an entity grants an award of 100 shares to an employee. The award is conditional upon the completion of four years' service which the employee is expected to achieve.

The employee's tax obligation of 40% is based on the fair value of the shares at vesting date. Tax law in the entity's jurisdiction requires the entity to withhold an amount for an employee's tax obligation associated with a share-based payment and transfer that amount in cash to the tax authority on behalf of the employee.

The terms and conditions of the share-based payment arrangement require the entity to withhold shares from the settlement of the award to the employee in order to settle the employee's tax obligation. Accordingly, the entity settles the transaction on a net basis by withholding the number of shares with a fair value equal to the monetary value of the employee's tax obligation and issuing the remaining shares to the employee at the end of the vesting period.

The fair value at grant date is £2 per share and at the end of year 4 is £10 per share.

The fair value of the shares on the vesting date (end of year 4) is £1,000 (100 × £10) and therefore the employee's tax obligation is £400 (100 × £10 × 40%). Accordingly, on the vesting date, the entity issues 60 shares to the employee, withholds 40 shares from the employee and pays £400 (the fair value of the shares withheld) in cash to the tax authority on the employee's behalf. In effect, it is as if the entity issued 100 vested shares to the employee and then repurchased 40 of them at fair value.

Accounting during the vesting period and on recognition and settlement of the tax obligation

Over the four-year vesting period, the entity recognises a cumulative IFRS 2 expense of £200 (£50 per annum) with a corresponding credit to equity. This is calculated as 100 shares × £2 grant date fair value.

	£	£
Employee costs	200	
Equity		200

At the date of vesting the tax liability is recognised and subsequently paid:

	£	£
Equity	400	
Tax liability		400
Tax liability	400	
Cash		400

The example in the implementation guidance also notes that the entity should consider disclosing at each reporting date an estimate of the expected tax payment (see 13.3 above).

15 OTHER PRACTICAL ISSUES

We discuss below the following aspects of the practical application of IFRS 2:

- matching share awards (including deferred bonuses delivered in shares) (see 15.1 below);
- loans to employees to purchase shares (limited recourse and full recourse loans) (see 15.2 below);
- awards entitled to dividends or dividend equivalents during the vesting period (see 15.3 below);
- awards vesting or exercisable on an exit event or change of control (flotation, trade sale etc.) (see 15.4 below);
- arrangements under South African black economic empowerment ('BEE') legislation and similar arrangements (see 15.5 below); and
- shares used as a currency of payment (see 15.6 below).

15.1 Matching share awards (including deferred bonuses delivered in shares)

As noted in the discussion at 10.1.2 above, the rules in IFRS 2 for awards where there is a choice of equity- or cash-settlement do not fully address awards where the equity and cash alternatives may have significantly different fair values and vesting periods. In some jurisdictions, a popular type of scheme giving rise to such issues is a matching share award. This section will generally refer to matching share awards but arrangements to defer bonus payments for later settlement in shares (without a matching element) raise a number of similar issues.

Under a matching share award, the starting point is usually that an employee is awarded a bonus for a one year performance period. At the end of that period, the employee may then be either required or permitted to take all or part of that bonus in shares rather than cash. To the extent that the employee takes shares rather than cash, the employing entity may then be required or permitted to make a 'matching' award of an equal number of shares (or a multiple or fraction of that number). The matching award will typically vest over a longer period.

Whilst such schemes can appear superficially similar, the accounting analysis under IFRS 2 may vary significantly, according to whether:

- the employee has a choice, or is required, to take some of the 'base' bonus in shares and whether any such shares have to be retained by the employee in order for the matching shares to vest; and/or
- the employer has a choice, or is required, to match any shares taken by the employee.

Examples 34.60 to 34.64 below set out an analysis of the five basic variants of such schemes, as summarised in the following matrix.

Employee's taking shares required or discretionary?	**Employer's matching required or discretionary?**	**Example**
Required	Required	34.60
Required	Discretionary	34.61
Discretionary	No provision for matching award	34.62
Discretionary	Required	34.63
Discretionary	Discretionary	34.64

A requirement for the employee to retain a base shareholding for the duration of the matching arrangement is a non-vesting condition and this is considered at the end of this section (following Example 34.64).

Example 34.60: Mandatory investment by employee of cash bonus into shares with mandatory matching award by employer

At the beginning of year 1 an employee is told that he is to participate in a bonus scheme which will pay £1,000 if certain performance criteria are met by the end of year 1 and he remains in service. The bonus will be paid at the beginning of year 2. 50% will be paid in cash and the employee will be required to invest the remaining 50% in as many shares as are worth £500 at the beginning of year 2. Thus, if the share price were £2.50, the employee would receive £500 cash and 200 shares. These shares are fully vested.

If this first award is achieved, the entity is required to award an equal number of additional shares ('matching shares') – in this example 200 shares – conditional upon the employee remaining in service until the end of year 3. The award of any matching shares will be made at the beginning of year 2.

Annual bonus

The 50% of the bonus paid in cash is outside the scope of IFRS 2 and within that of IAS 19 (see Chapter 35). The 50% of the annual bonus settled in shares is an equity-settled share-based payment transaction within the scope of IFRS 2, since there is no discretion over the manner of settlement. The measurement date for this element of the bonus is 1 January in year 1 and the vesting period is year 1, since all vesting conditions have been met by the end of that year. Notwithstanding that the two legs of the award strictly fall within the scope of two different standards, the practical effect will be to charge an expense over the course of year 1.

Matching shares

The terms of the award of 200 matching shares have the effect that the entity has committed, as at the beginning of year 1, to award shares with a value of £500 as at the beginning of year 2, subject to satisfaction of:

- a performance condition relating to year 1; and
- a three year service condition (years 1 to 3).

Those terms are understood by all parties at the beginning of year 1, which is therefore the measurement date. The fact that the matching award is not formally made until the beginning of year 2 is not relevant, since there has been a binding commitment to make the award, on terms understood both by the entity and the employee, since the beginning of year 1 (see 5.3 above).

The vesting period is the three year period to the end of year 3. As at the end of year 1 only one of the vesting conditions (i.e. the performance condition) has been met. The further vesting condition (i.e. the service condition) is not met until the end of year 3.

The discussion in 8.10 above is relevant to the valuation of the equity elements of the award.

Example 34.61: Mandatory investment by employee of cash bonus into shares with discretionary matching award by employer

At the beginning of year 1 an employee is told that he is to participate in a bonus scheme which will pay £1,000 if certain performance criteria are met by the end of year 1 and he remains in service. The bonus will be paid at the beginning of year 2. 50% will be paid in cash and the employee will be required to invest the remaining 50% in as many shares as are worth £500 at the beginning of year 2. Thus, if the share price were £2.50, the employee would receive £500 cash and 200 shares. These shares are fully vested.

If this first award is achieved, the entity has the discretion, but not the obligation, to award an equal number of additional shares ('matching shares') – in this case 200 shares – conditional upon the employee remaining in service until the end of year 3. The award of any matching shares will be made at the beginning of year 2.

Annual bonus

The 50% of the bonus paid in cash is outside the scope of IFRS 2 and within that of IAS 19 (see Chapter 35). The 50% of the annual bonus settled in shares is an equity-settled share-based payment transaction within the scope of IFRS 2, since there is no discretion over the manner of settlement. The measurement date for this element of the bonus is 1 January in year 1 and the vesting period is year 1, since all vesting conditions have been met by the end of that year. Notwithstanding that the two legs of the award strictly fall within the scope of two different standards, the practical effect will be to charge an expense over the course of year 1.

Matching shares

In our view, it is necessary to consider whether the entity's discretion is real or not, this being a matter for judgement in the light of individual facts and circumstances.

In some cases the entity's discretion to make awards may have little real substance. For example, the awards may simply be documented as 'discretionary' for tax and other reasons. It may also be that the entity has consistently made matching awards to all eligible employees (or all members of a particular class of eligible employees), so that it has no realistic alternative but to make matching awards if it wants to maintain good staff relations. In such cases, it may be helpful to consider what the accounting for the 'matching' award would be if it were a pure cash award falling within the scope of IAS 19:

> 'An entity may have no legal obligation to pay a bonus. Nevertheless, in some cases, an entity has a practice of paying bonuses. In such cases, the entity has a constructive obligation because the entity has no realistic alternative but to pay the bonus. The measurement of the constructive obligation reflects the possibility that some employees may leave without receiving a bonus.' *[IAS 19.21]*.

This is discussed further in Chapter 35 at 12.3.

In making the determination of whether a constructive obligation would exist under IAS 19, it would be necessary to consider past data (e.g. the number of employees who have received matching awards having received the original award).

If it is concluded that the entity does not have a constructive obligation to make a matching award, the accounting treatment would follow the legal form of the transaction. On this view, the grant date (and therefore measurement date) would be 1 January in year 2, and the vesting period the two years from the beginning of year 2 to the end of year 3.

If it is concluded that the entity does have a constructive obligation to make a matching award, the effect is that the matching award of shares is equivalent to the mandatory matching award in Example 34.60 above, and should therefore be accounted for in the same way – i.e. the measurement date is 1 January in year 1 and the vesting period is the three year period to the end of year 3.

The discussion in 8.10 above is relevant to the valuation of the matching equity award.

Example 34.62: Discretionary investment by employee of cash bonus into shares with no matching award

At the beginning of year 1 an employee is told that he is to participate in a bonus scheme which will pay £1,000 if certain performance criteria are met by the end of year 1 and he remains in service. The bonus will be paid at the beginning of year 2. 50% will be paid in cash and the employee will be permitted, but not required, to invest the remaining 50% in as many shares as are worth £500 at the beginning of year 2. Thus, if the share price were £2.50, the employee could choose to receive either (a) £1,000 or (b) £500 cash and 200 shares. Any shares received are fully vested.

The 50% of the bonus automatically paid in cash is outside the scope of IFRS 2 and within that of IAS 19 (see Chapter 35).

The 50% of the bonus that may be invested in shares falls within the scope of IFRS 2 as a share-based payment transaction in which the terms of the arrangement provide the counterparty with the choice of settlement. This is the case even though the value of the alternative award is always £500 and does not depend on the share price (see 10.4 above).

The measurement date of the award is 1 January in year 1 and the vesting period is year 1. The methodology set out in IFRS 2 for awards where the counterparty has a choice of settlement would lead to recognition over the vesting period of a liability component of £500 and an equity component of zero (see 10.1.2 above). If in fact the employee took shares at vesting, the £500 liability would be transferred to equity.

Example 34.63: Discretionary investment by employee of cash bonus into shares with mandatory matching award by employer

At the beginning of year 1 an employee is told that he is to participate in a bonus scheme which will pay £1,000 if certain performance criteria are met by the end of year 1 and he remains in service. The bonus will be paid at the beginning of year 2. 50% will be paid in cash and the employee will be permitted, but not required, to invest the remaining 50% in as many shares as are worth £500 at the beginning of year 2. Thus, if the share price were £2.50, the employee could choose to receive either (a) £1,000 or (b) £500 cash and 200 shares.

If the employee elects to reinvest the bonus in shares, the shares are not fully vested unless the employee remains in service until the end of year 3. However, if the employee elects to receive 50% of the bonus in shares, the entity is required to award an equal number of additional shares (‘matching shares’), in this case 200 shares, also conditional upon the employee remaining in service until the end of year 3. The award of any matching shares will be made at the beginning of year 2.

The 50% of the bonus automatically paid in cash is outside the scope of IFRS 2 and within that of IAS 19 (see Chapter 35).

The 50% of the bonus that may be invested in shares falls within the scope of IFRS 2 as a share-based payment transaction in which the terms of the arrangement provide the counterparty with the choice of settlement. This is the case even though the value of the alternative award is always £500 and does not depend on the share price (see 10.4 above).

The mandatory nature of the matching shares means that the award is a share-based payment transaction, entered into at the beginning of year 1 (and therefore measured as at that date), in which the terms of the arrangement provide the counterparty with a choice of settlement between:

- at the beginning of year 2: cash of £500, subject to service and performance during year 1; or
- at the end of year 3: shares with a value of £1,000 as at the beginning of year 2, subject to:
  - (i) performance in year 1; and
  - (ii) service during years 1 to 3.

The equity component as calculated in accordance with IFRS 2 will have a value in excess of zero (see 10.1.2 above). The measurement date of the equity component is the beginning of year 1. However, as discussed at 10.1.3.A above, IFRS 2 does not specify how to deal with a transaction where the counterparty has the choice of equity- or cash-settlement but the liability and equity components have different vesting periods. In our view it is appropriate to recognise the liability and equity components independently over their different vesting periods, i.e. in this case:

- for the liability component (i.e. the fair value of the cash alternative), during year 1;
- for the equity component (i.e. the excess of the total fair value of the award over the fair value of the cash alternative), during the three year period to the end of year 3.

Thus, at the end of year 1, the entity will have recorded an IFRS 2 expense together with a corresponding:

- liability for the cost of the portion of the annual award that the employee may take in cash or equity (the liability component referred to above);
- credit to equity, for one-third of the cost of the matching award (the equity component referred to above).

If the employee decides to take shares, the entity would simply transfer the amount recorded as a liability to equity and recognise the remaining cost of the matching shares over the following two years.

If, however, the employee elects to take cash, the position is more complicated. Clearly, the main accounting entry is to reduce the liability, with a corresponding reduction in cash, when the liability is settled. However, this raises the question of what is to be done with the one-third cost of the matching award already recognised in equity and the remaining, as yet unrecognised, two-thirds cost.

An election by the employee for cash at the end of year 1 should be treated as a cancellation of the matching award, due to the employee's failure to fulfil a non-vesting condition (i.e. not taking the cash alternative) for the matching award – see 3.2 and 6.4 above. Therefore, the one-third cost that had already been expensed would not be reversed and the remaining two-thirds of the matching award not yet recognised would be recognised immediately, resulting in an expense for an award that does not actually crystallise.

The analysis above assumes that the equity award either vests or is cancelled because the employee decides to take the cash award. An alternative outcome would be that the employee chooses the equity-settled award but then fails to meet the three year service condition attached to that award. This would result in forfeiture of the equity-settled award and the reversal of any expense previously recognised for the equity component. However, this raises a question about the treatment of the amount for the cash component that was credited to equity when the employee chose the equity award rather than the cash award. In our view, there are two alternative approaches:

- The employee's decision to invest 50% of the bonus into the share award is similar to the employee making a non-refundable deposit for the shares and so it is appropriate to leave this amount in equity and not reverse it through profit or loss as part of the forfeiture accounting for the equity award.
- The reclassification of £500 from liability to equity is part of the consideration for the forfeited equity instruments and relates to past service rendered in connection with the equity component of the award and so it is appropriate to reverse this amount through profit or loss as part of the forfeiture.

In our view, either approach is acceptable but should be applied consistently.

Example 34.64: Discretionary investment by employee of cash bonus into shares with discretionary matching award by employer

At the beginning of year 1 an employee is told that he is to participate in a bonus scheme which will pay £1,000 if certain performance criteria are met by the end of year 1 and he remains in service. The bonus will be paid at the beginning of year 2. 50% will be paid in cash and the employee will be permitted, but not required, to invest the remaining 50% in as many shares as are worth £500 at the beginning of year 2. Thus, if the share price were £2.50, the employee could choose to receive either (a) £1,000 or (b) £500 cash and 200 shares. Any shares received under this part of the arrangement are fully vested.

If the employee elects to receive shares, the entity has the discretion, but not the obligation, to award additional shares ('matching shares') – in this case 200 shares – conditional upon the employee remaining in service until the end of year 3. The award of any matching shares will be made at the beginning of year 2.

The 50% of the bonus automatically paid in cash is outside the scope of IFRS 2 and within that of IAS 19 (see Chapter 35).

The 50% of the bonus that may be invested in shares falls within the scope of IFRS 2 as a share-based payment transaction in which the terms of the arrangement provide the counterparty with the choice of settlement. This is the case even though the value of the alternative award is always £500 and does not depend on the share price (see 10.4 above).

In our view, it is necessary, as discussed in Example 34.61 above, to consider whether the entity's discretion to make an award of matching shares is real or not, this being a matter for judgement in the light of individual facts and circumstances.

If it is determined that the entity is effectively obliged to match any share award taken by the employee, then the award should be analysed as giving the employee the choice of settlement between:

- At the beginning of year 2: cash of £500, subject to service and performance during year 1; or
- At the beginning of year 2 shares with a value of £500 as at that date, subject to service and performance during year 1; and, at the end of year 3: the same number of shares again subject to (i) performance during year 1 and (ii) service during the three year period to the end of year 3.

In this case the grant date (and therefore measurement date) of all the equity awards would be taken as the beginning of year 1. As regards the award due to vest at the beginning of year 2, this would be split into its equity and liability components, and in this case the equity component would have a value of zero (since the two components are essentially worth the same amount of £500). Thus, the entity would accrue a liability during year 1. The matching share award would be expensed over the three year period to the end of year 3.

Thus, at the end of year 1, the entity will have recorded an IFRS 2 expense together with a corresponding:

- liability for the cost of the portion of the annual award that the employee may take in cash or equity (the liability component); and
- credit to equity for one-third of the cost of the matching award (the equity component).

If the employee decides to take shares at the beginning of year 2, the entity would simply transfer the amount recorded as a liability to equity and recognise the remaining cost of the matching shares over the following two years.

If, however, the employee elects to take cash, the position is more complicated. Clearly, the main accounting entry is to reduce the liability, with a corresponding reduction in cash, when the liability is settled. However, this raises the question of what is to be done with the one-third cost of the matching award already recognised in equity and the remaining, as yet unrecognised, two-thirds cost.

As in Example 34.63 above, an election by the employee for cash at the end of year 1 should be treated as a cancellation of the matching award, due to the employee's failure to fulfil a non-vesting condition (i.e. not taking the cash alternative) for the matching award – see 3.2 and 6.4 above. Therefore, the one-third cost that had already been expensed would not be reversed and the remaining two-thirds of the matching award not yet recognised would be recognised immediately, resulting in an expense for an award that does not actually crystallise.

If it is concluded that the entity has genuine discretion to make a matching award, the analysis is somewhat different.

The portion of the annual award that may be taken in shares should be analysed as giving the employee the choice, at the beginning of year 2, between cash of £500 and shares worth £500 (the number of shares being determined by reference to the share price at that date). This would be split into its equity and liability components, and in this case the equity component would have a value of zero (since the two components are essentially worth the same). Thus, the entity would accrue a liability during year 1. If the employee elected to receive shares, this liability would be transferred to equity.

Any matching share award would be treated as being granted on, and measured as at, the beginning of year 2. The cost would be recognised over the two year period from the beginning of year 2 to the end of year 3.

The discussion in 8.10 above is relevant to the valuation of the matching equity award.

Example 34.63 above discusses the accounting treatment in a situation where the employee fails to meet the service condition.

If, as is often the case in practice, the employee had to retain his original holding of shares and complete a further period of service in order for the matching award to vest, the requirement to retain the original shares would be treated as a non-vesting condition and taken into account in the grant date fair value of the matching award (see 6.4 above). Failure to meet this non-vesting condition, by disposing of the shares whilst remaining in employment during the matching period, would be treated as a cancellation of the matching award as holding the shares is a condition within the employee's control (see 6.4.3 above).

15.2 Loans to employees to purchase shares (limited recourse and full recourse loans)

In some jurisdictions, share awards to employees are made by means of so-called 'limited recourse loan' schemes. The detailed terms of such schemes vary, but typical features include the following:

- the entity makes an interest-free loan to the employee which is immediately used to acquire shares to the value of the loan on behalf of the employee;
- the shares may be held by the entity, or a trust controlled by it (see 12.3 above), until the loan is repaid;
- the employee is entitled to dividends, except that these are treated as paying off some of the outstanding loan;
- within a given period (say, five years) the employee must either have paid off the outstanding balance of the loan, at which point the shares are delivered to the employee, or surrendered the shares. Surrender of the shares by the employee is treated as discharging any outstanding amount on the loan, irrespective of the value of the shares.

The effect of such an arrangement is equivalent to an option exercisable within five years with an exercise price per share equal to the share price at grant date less total dividends since grant date – a view reinforced by the Interpretations Committee.[35] There is no real loan at the initial stage. The entity has no right to receive cash or another financial asset, since the loan can be settled by the employee returning the (fixed) amount of equity 'purchased' at grant date.

Indeed, the only true cash flow in the entire transaction is any amount paid at the final stage if the employee chooses to acquire the shares at that point. The fact that the exercise price is a factor of the share price at grant date and dividends paid between grant date and the date of repayment of the 'loan' is simply an issue for the valuation of the option.

The arrangement is valued using an option-pricing model and the fair value is based on the employee's implicit right to buy the shares at a future date rather than being the share price at grant date (the face value of the loan).

The loan arrangement might have a defined period during which the employee must remain in service (five years in the example above) and during which there might also be performance conditions to be met. Where this is the case, the IFRS 2 expense will be recognised by the entity over this period. However, where, as is frequently the case, such an award is subject to no future service or performance condition, i.e. the 'option' is, in effect, immediately exercisable by the employee should he choose to settle the 'loan', IFRS 2 requires the cost to be recognised in full at grant date (see 6.1 above).

There are also some arrangements where the loan to the employee to acquire the shares is a full recourse loan (i.e. it cannot be discharged simply by surrendering the shares and there can be recourse to other assets of the employee). However, the amount repayable on the loan is reduced not only by dividends paid on the shares, but also by the achievement of performance targets, such as the achievement of a given level of earnings.

The appropriate analysis of such awards is more difficult, as they could be viewed in two ways:

- either the employer has made a loan (which the employee has chosen to use to buy a share), accounted for under IFRS 9, and has then entered into a performance-related cash bonus arrangement with the employee, accounted for under IAS 19; or
- the transaction is a share option where the exercise price varies according to the satisfaction of performance conditions and the amount of dividends on the shares, accounted for under IFRS 2.

The different analyses give rise to potentially significantly different expenses. This will particularly be the case where one of the conditions for mitigation of the amount repayable on the loan is linked to the price of the employer's equity. As this is a market condition, the effect of accounting for the arrangement under IFRS 2 may be that an expense is recognised in circumstances where no expense would be recognised under IAS 19.

Such awards need to be carefully analysed, in the light of their particular facts and circumstances, in order to determine the appropriate treatment. Factors that could suggest that IFRS 2 is the more relevant standard would, in our view, include:

- the employee can use the loan only to acquire shares;
- the employee cannot trade the shares until the loan is discharged; or
- the entity has a practice of accepting (e.g. from leavers) surrender of the shares as full discharge for the amount outstanding on the loan and does not pursue any shortfall between the fair value of the shares and the amount owed by the employee. This would tend to indicate that, in substance, the loan is not truly full recourse.

15.3 Awards entitled to dividends or dividend equivalents during the vesting period

Some awards entitle the holder to receive dividends on unvested shares (or dividend equivalents on options) during the vesting period.

For example, in some jurisdictions, entities make awards of shares that are regarded as fully vested for the purposes of tax legislation (typically because the employee enjoys the full voting and dividend rights of the shares), but not for accounting purposes (typically because the shares are subject to forfeiture if a certain minimum service period is not achieved). In practice, the shares concerned are often held by an EBT until the potential forfeiture period has expired.

Another variant of such an award that is sometimes seen is where an entity grants an employee an option to acquire shares in the entity which can be exercised immediately. However, if the employee exercises the option but leaves within a certain minimum period from the grant date, he is required to sell back the share to the entity (typically either at the original exercise price, or the lower of that price or the market value of the share at the time of the buy-back – see also the discussions at 15.4.5 below).

Such awards do not fully vest for the purposes of IFRS 2 until the potential forfeiture or buy-back period has expired. The cost of such awards should therefore be recognised over this period.

This raises the question of the accounting treatment of any dividends paid to employees during the vesting period, either as a charge to profit or loss as employee costs or a return on an equity instrument. Conceptually, it could be argued that such dividends cannot be dividends for financial reporting purposes since the equity instruments to which they relate are not yet regarded as issued for financial reporting purposes. One consequence of this, is that shares subject to such an award are excluded from the number of ordinary shares outstanding for the purposes of calculating EPS in accordance with IAS 33. These dividend entitlements would, however they are accounted for, constitute a reduction in earnings available to ordinary shareholders when applying IAS 33 (which is discussed in Chapter 37). As it is argued that equity instruments to which the dividends relate are not yet regarded as issued for financial reporting purposes, this would lead to the conclusion that dividends paid in the vesting period should be charged to profit or loss as an employment cost.

However, the charge to be made for the award under IFRS 2 will already take account of the fact that the recipient is entitled to receive dividends during the vesting period. If the recipient is not entitled to receive dividends during the vesting period a discount would be reflected in the fair value of the award; if the recipient is entitled to dividends, no such adjustment is made (see 8.5.4 above). Thus, it could be argued that also to charge profit or loss with the dividends paid is a form of double counting. Moreover, whilst the relevant shares may not have been fully issued for financial reporting purposes, the basic IFRS 2 accounting does build up an amount in equity over the vesting period. It could therefore be argued that – conceptually, if not legally – any dividend paid relates not to an issued share, but rather to the equity instrument represented by the cumulative amount that has been recorded for the award as a credit to equity, and can therefore appropriately be shown as a deduction from equity.

The argument above is valid only to the extent that the credit to equity represents awards that are expected to vest. It cannot apply to dividends paid to employees whose awards are either known not to have vested or treated as expected not to vest when applying IFRS 2 (since there is no credit to equity for these awards). Accordingly, we believe that the most appropriate approach is to analyse the dividends paid so that, by the date of vesting, cumulative dividends paid on awards treated by IFRS 2 as vested are deducted from equity and those paid on awards treated by IFRS 2 as unvested are charged to profit or loss. The allocation for periods prior to vesting should be based on a best estimate of the final outcome, as illustrated by Example 34.65 below.

Example 34.65: Award with rights to receive (and retain) dividends during vesting period

An entity grants 100 free shares to each of its 500 employees. The shares are treated as fully vested for legal and tax purposes, so that the employees are eligible to receive any dividends paid. However, the shares will be forfeited if the employee leaves within three years of the award being made. Accordingly, for the purposes of IFRS 2, vesting is conditional upon the employee working for the entity over the next three years. The entity estimates that the fair value of each share (including the right to receive dividends during the IFRS 2 vesting period) is €15. Employees are entitled to retain any dividend received even if the award does not vest.

20 employees leave during the first year, and the entity's best estimate at the end of year 1 is that 75 employees will have left before the end of the vesting period. During the second year, a further 22 employees leave, and the entity revises its estimate of total employee departures over the vesting period from 75 to 60. During the third year, a further 15 employees leave. Hence, a total of 57 employees (20 + 22 + 15) forfeit their rights to the shares during the three year period, and a total of 44,300 shares (443 employees × 100 shares per employee) finally vest.

The entity pays dividends of €1 per share in year 1, €1.20 per share in year 2, and €1.50 in year 3.

Under IFRS 2, the entity will recognise the following amounts during the vesting period for services received as consideration for the shares.

Year	Calculation of cumulative expense	Cumulative expense (€)	Expense for period (€)
1	100 shares × 425 employees × €15 × 1/3	212,500	212,500
2	100 shares × 440 employees × €15 × 2/3	440,000	227,500
3	100 shares × 443 × €15 × 3/3	664,500	224,500

On the assumption that all employees who leave during a period do so on the last day of that period (and thus receive dividends paid in that period), in our view the dividends paid on the shares should be accounted for as follows:

		€	€
Year 1	Profit or loss (employee costs)[1]	7,500	
	Equity[1]	42,500	
	Cash[2]		50,000
Year 2	Profit or loss (employee costs)[3]	3,300	
	Equity[3]	54,300	
	Cash[4]		57,600
Year 3	Profit or loss (employee costs)[5]	1,590	
	Equity[5]	67,110	
	Cash[6]		68,700

1 20 employees have left and a further 55 are anticipated to leave. Dividends paid to those employees (100 shares × 75 employees × €1 = €7,500) are therefore recognised as an expense. Dividends paid to other employees are recognised as a reduction in equity.

2 100 shares × 500 employees × €1.

3 22 further employees have left and a further 18 are anticipated to leave. The cumulative expense for dividends paid to leavers and anticipated leavers should therefore be €10,800 (100 shares × 20 employees × €1 = €2,000 for leavers in year 1 + 100 shares × 40 employees × [€1 + €1.20] for leavers and anticipated leavers in year 2 = €8,800). €7,500 was charged in year 1, so the charge for year 2 should be €10,800 – €7,500 = €3,300. This could also have been calculated as charge for leavers and expected leavers in current year €4,800 (100 shares × 40 [22 + 18] employees × €1.20) less reversal of expense in year 1 for reduction in anticipated final number of leavers €1,500 (100 shares × 15 [75 – 60] employees × €1.00). Dividends paid to other employees are recognised as a reduction in equity.

4 100 shares × 480 employees in employment at start of year × €1.20.

5 15 further employees have left. The cumulative expense for dividends paid to leavers should therefore be €12,390 (€2,000 for leavers in year 1 (see 3 above) + 100 shares × 22 employees × [€1 + €1.20] = €4,840 for leavers in year 2 + 100 shares × 15 employees × [€1 + €1.20 + €1.50] = €5,550 for leavers in year 3). A cumulative expense of €10,800 (see 3 above) was recognised by the end of year 2, so the charge for year 3 should be €12,390 – €10,800 = €1,590. This could also have been calculated as charge for leavers in current year €2,250 (100 shares × 15 employees × €1.50) less reversal of expense in years 1 and 2 for reduction in final number of leavers as against estimate at end of year 2 €660 (100 shares × 3 [60 – 57] employees × [€1.00 + €1.20]). Dividends paid to other employees are recognised as a reduction in equity.

6 100 shares × 458 employees in employment at start of year × €1.50.

15.4 Awards vesting or exercisable on an exit event or change of control (flotation, trade sale etc.)

Entities frequently issue awards connected to a significant event such as a flotation, trade sale or other change of control of the business. It may be that an award that would otherwise be equity-settled automatically becomes cash-settled if such an event crystallises and the entity has no choice as to the method of settlement (as discussed at 10.3 above).

However, it may also be the case that an award vests only on such an event, which raises various issues of interpretation, as discussed below.

The sections below should be read together with the more general discussions elsewhere in this chapter (as referred to in the narrative below) on topics such as grant date, vesting period, vesting and non-vesting conditions and classification as equity-settled or cash-settled. References to flotation should be read as also including other exit events.

15.4.1 *Grant date*

Sometimes such awards are structured so that they will vest on flotation or so that they will vest on flotation subject to further approval at that time. For awards in the first category, grant date as defined in IFRS 2 will be the date on which the award is first communicated to employees (subject to the normal requirements of IFRS 2 relating to a shared understanding, offer and acceptance, as discussed at 5.3 above). For awards in the second category, grant date will be at or around the date of flotation, when the required further approval is given.

This means that the IFRS 2 cost of awards subject to final approval at flotation will generally be significantly higher than that of awards that do not require such approval. Moreover, as discussed further at 5.3.2 above, it may well be the case that employees begin rendering service for such awards before grant date (e.g. from the date on which the entity communicates its intention to make the award in principle). In that case, the entity would need to make an initial estimate of the value of the award for the purpose of recognising an expense from the date services have been provided, and continually re-assess that value up until the actual IFRS 2 grant date. As with any award dependent on a non-market vesting condition, an expense would be recognised only to the extent that the award is considered likely to vest. The classification of a requirement to float as a non-market vesting condition is discussed further at 15.4.3 below.

15.4.2 *Vesting period*

Many awards that vest on flotation have a time limit – in other words, the award lapses if flotation has not occurred on or before a given future date. In principle, as discussed at 6.2.3 above, when an award has a variable vesting period due to a non-market performance condition, the reporting entity should make a best estimate of the likely vesting period at each reporting date and calculate the IFRS 2 charge on the basis of that best estimate.

In practice, the likely timing of a future flotation is notoriously difficult to assess months, let alone years, in advance. In such cases, it would generally be acceptable simply to recognise the cost over the full potential vesting period until there is real clarity that a shorter period may be more appropriate. However, in making the assessment of the likelihood of vesting, it is important to take the company's circumstances into account. The likelihood of an exit event in the short- to medium-term is perhaps greater for a company owned by private equity investors seeking a return on their investment than for a long-established family-owned company considering a flotation.

It is worth noting that once an exit event becomes likely, the IFRS 2 expense will in some cases need to be recognised over a shorter vesting period than was originally envisaged as the probability of the exit event occurring will form the basis at the reporting date of the estimate of the number of awards expected to vest (see also the discussion at 6.2.3 and 7.6 above).

This contrasts with the US GAAP approach where, in practice, an exit event that is a change in control or an initial public offering is only recognised when it occurs. In a situation where a change in control or an initial public offering occurs shortly after the reporting date, it is therefore possible that the expense will need to be recognised in an earlier period under IFRS than under US GAAP.

15.4.3 Is flotation or sale a vesting condition or a non-vesting condition?

There was debate in the past about whether a requirement for a flotation or sale to occur in order for an award to vest was a vesting condition or a non-vesting condition. The argument for it being a non-vesting condition was that flotation or sale may occur irrespective of the performance of the entity. The counter-argument was essentially that the price achieved on flotation or sale, which typically affects the ultimate value of the award (see 15.4.4 below), reflects the performance of the entity and is therefore a non-market performance condition (provided there is an associated service condition – see further below).

As part of its wider project on vesting and non-vesting conditions, the Interpretations Committee reached a tentative decision in July 2010 that a condition requiring an initial public offering (IPO) or a change of control should be deemed to be a performance vesting condition rather than a non-vesting condition. This was subsequently reflected in general terms through the IASB's amendments to the definition of a performance condition in the *Annual Improvements to IFRSs 2010-2012 Cycle* (see 3.1 and 3.2 above). The amendments were intended, *inter alia*, to make clear that a requirement for flotation or sale (with an associated service condition) is a performance condition rather than a non-vesting condition on the basis that the flotation or sale condition is by reference to the entity's own operations.

The amendments also made it clear that a performance target period cannot extend beyond the end of the associated service period in order for the definition of a performance vesting condition to be met (see 3.2.2 above). Therefore, the flotation or sale condition will be treated as a non-vesting condition, rather than as a vesting condition, if the service period is not at least as long as the duration of the flotation or sale condition.

It is possible that in a share-based payment transaction a flotation or sale condition can be both a performance vesting condition and a non-vesting condition in an award that vests in instalments, 'graded vesting' (see 6.2.2 above). Where the share-based payment transaction vests in instalments and the service period is not at least as long as the duration of the flotation or sale condition, that condition will be treated as a non-vesting condition (see 3.2 above). In contrast, when the service condition is the same duration as the flotation and sale condition, that condition will be treated as non-market performance condition (see 3.1 above), this is illustrated in Example 34.66 below:

Example 34.66: Award vesting in instalments with a floatation or sale condition

An entity issues an award to employees at the beginning of year 1 with gradual vesting over five years. The award will vest 20 per cent in each year of service over the five year period. In addition to the service condition there is a flotation or sale condition that must be met at the end of year 5. As discussed at 6.2.2 above, the award that vests in instalments will be treated as five different tranches because each tranche has a different vesting period with different fair values. The flotation or sale condition will be a non-vesting condition and factored in the grant date fair value of tranches 1 to 4 as the service period is not as long as the duration of the flotation or sale condition. However, for tranche 5, the service and performance conditions are for the same duration, therefore the flotation or sale condition will be treated as a non-market performance condition and not factored into the grant date fair value but factored into the number of awards that will vest for tranche 5.

The impact of treating the flotation or sale condition differently, results in an expense being recognised for the first four tranches regardless of the flotation or sale condition being met, so long as the service condition is met, as the likelihood of not meeting the flotation or sale condition is factored into the grant date fair value. In contrast for tranche 5 if the floatation or service condition is not met but the service condition is met, no expense will be recognised as the non-market performance condition has not been met.

The floatation or sale condition even though is deemed to relate to the entity's own operations and therefore generally classified as a performance condition, it will sometimes be concluded that fulfilment of the condition is outside the control of both the entity and the counterparty. The settlement of an award in equity or cash might depend on the outcome of the condition i.e. there might be either cash- or equity-settlement that is entirely contingent on the exit event. Such contingent arrangements are discussed at 10.3 above.

15.4.4 Awards requiring achievement of a minimum price on flotation or sale

Some awards with a condition dependent on flotation (or another similar event) vest only if a minimum price per share is achieved. For example, an entity might grant all its employees share options, the vesting of which is conditional upon a flotation or sale of the shares at a price of at least €5 per share within five years, and the employee still being in employment at the time of the flotation or sale.

Taken alone, the requirement for a flotation or sale to occur is a non-market performance condition (see further below and at 15.4.3 above). However, if a minimum market price has to be achieved, the question arises as to whether, in addition to the service requirement, such an award comprises:

- a single market performance condition (i.e. float or sell within five years at a share price of at least €5); or
- two conditions:
  - a market performance condition (share price at time of flotation or sale of at least €5); and
  - a non-market performance condition (flotation or sale achieved within five years).

The significance of this is the issue discussed at 6.3 above, namely that an expense must always be recognised for all awards with a market condition, if all the non-market vesting conditions are satisfied, even if the market condition is not. In either case, however, there is a market condition which needs to be factored into the valuation of the award.

If the view is that 'flotation or sale at €5 within five years' is a single market condition, the entity will recognise an expense for the award for all employees still in service at the end of the five year period, since the sole non-market vesting condition (i.e. service) will have been met. Note that this assumes that the full five-year period is considered the most likely vesting period at grant date (see 6.3.4 and 15.4.2 above).

If, on the other hand, the view is that 'flotation or sale within five years' and 'flotation or sale share price €5' are two separate conditions, and no flotation or sale occurs, no expense will be recognised since the performance element of the non-market vesting condition (i.e. 'flotation or sale within five years') has not been satisfied. However, even on this second analysis, if a sale or flotation is achieved at a price less than €5, an expense must be recognised, even though the award does not truly vest, since the non-market condition (i.e. 'flotation or sale within five years' with its associated service requirement) will have been met.

In our view, the appropriate analysis is to regard 'flotation or sale within five years' and 'flotation or sale share price €5' as two separate conditions.

The example above assumes that there is a service condition equal in duration to the other conditions attached to the award and hence the analysis above only considers vesting conditions. If the fact pattern were such that there was no service condition, or a service condition that was of a shorter duration than the other conditions, then those conditions would need to be treated as non-vesting conditions rather than as performance vesting conditions (see 3.1 and 3.2 above and Example 34.66 above).

15.4.5 Awards 'purchased for fair value'

As noted at 2.2.4.D above, entities that are contemplating a flotation or trade sale may invite employees to subscribe for shares (often a special class of share) for a relatively nominal amount. In the event of a flotation or trade sale occurring, these shares may be sold or will be redeemable at a substantial premium. It is often argued that the initial subscription price paid represents the fair value of the share at the time, given the inherent high uncertainty as to whether a flotation or trade sale will in fact occur.

The premium paid on the shares in the event of a flotation or trade sale will typically be calculated in part by reference to the price achieved. The question therefore arises as to whether such awards fall within the scope of IFRS 2. It might be argued for example that, as the employee paid full fair value for the award at issue, there has been no share-based payment and, accordingly, the instrument should be accounted for under IAS 32 and IFRS 9.

In our view, in order to determine whether the arrangement falls within the scope of IFRS 2, it is necessary to consider whether the award has features that would not be expected in 'normal' equity transactions – in particular, a requirement for the holder of the shares to remain in employment until flotation or sale and/or individual buyback arrangements. If this is the case, regardless of the amount subscribed, the terms suggest that the shares are being awarded in connection with, and in return for, employee services and hence that the award is within the scope of IFRS 2. This may mean that, even if the award has no material fair value once the subscription price has been taken into account (and therefore gives rise to no IFRS 2 expense), it may be necessary to make the disclosures required by IFRS 2.

Moreover, even if the amount paid by the employees can be demonstrated to be fair value for tax or other purposes, that amount would not necessarily constitute fair value under IFRS 2. Specifically, a 'true' fair value would take into account non-market vesting conditions (such as a requirement for the employee to remain in employment until flotation or a trade sale occurs). However, a valuation for IFRS 2 purposes would not take such conditions into account (see 5.5 and 6.2.1 above) and would therefore typically be higher than the 'true' fair value.

If the arrangement relates to a special class of share rather than ordinary equity shares, the underlying shares might well be classified as a liability rather than as equity under IAS 32. However, if the redemption amount is linked to the flotation price of the 'real' equity, the arrangement will be a cash-settled share-based payment transaction under IFRS 2 (see 2.2.4.A above).

It is common in such situations for the cost of satisfying any obligations to the special shareholders to be borne by shareholders rather than by the entity itself. This raises a number of further issues, which are discussed at 2.2.2.A above and at 15.4.6 below.

The approach outlined in this section, i.e. that there will generally be no additional IFRS 2 expense to recognise when the counterparty subscribes for a share at fair value, is the approach most commonly applied in practice by entities accounting under IFRS. In this type of arrangement, the subscription price, or market value if lower, is often refundable to employees who leave employment before the shares vest. In such cases, subscription amounts paid by the counterparty for the shares are generally classified as a liability by the entity until such time as the shares finally vest (at which point the cash paid will be treated as the proceeds of issuing shares).

However, this is not the only approach seen in practice. US GAAP, for example, requires in certain circumstances the recognition of an expense (representing the amount potentially at risk) in cases where an employee subscribes for a share at fair value but risks forfeiting some, or all, of the price paid for that share, together with any subsequent increases in value, should he fail to fulfil the service condition. In determining whether an expense must be recognised for the amount risked by the employee, an entity applying US GAAP must establish that there is a clear business purpose for the employee taking such a risk. In our view, in the absence of specific guidance, the recognition of such an expense is not a requirement based on IFRS 2 as currently drafted.

15.4.6 'Drag along' and 'tag along' rights

An award might be structured to allow management of an entity to acquire a special class of equity at fair value (as in 15.4.5 above), but (in contrast to 15.4.5 above) with no redemption right on an exit event. However, rights are given:

- to any buyer of the 'normal' equity also to buy the special shares (sometimes called a 'drag along' right);
- to a holder of the special shares to require any buyer of the 'normal' equity also to buy the special shares (sometimes called a 'tag along' right).

Such schemes are particularly found in entities where the 'normal' equity is held by a provider of venture capital, which will generally be looking for an exit in the medium term.

It may well be that, under the scheme, the entity itself is required to facilitate the operation of the drag along or tag along rights, which may involve the entity collecting the proceeds from the buyer and passing them on to the holder of the special shares.

This raises the issue of whether such an arrangement is equity-settled or cash-settled. The fact that, in certain circumstances, the entity is required to deliver cash to the holder of a share suggests that the arrangement is an award requiring cash settlement in specific circumstances, the treatment of which is discussed at 10.3 above.

However, if the terms of the award are such that the entity is obliged to pass on cash to the holder of the share only if, and to the extent that, proceeds are received from an external buyer, in our view, the arrangement may be economically no different to the broker settlement arrangements typically entered into by listed entities, as discussed at 9.2.4 above. This could allow the arrangement to be regarded as equity-settled because the entity's only involvement as a principal is in the initial delivery of shares to employees, provided that consideration is given to all the factors (discussed at 9.2.4 above) that could suggest that the scheme is more appropriately regarded as cash-settled.

In making such an assessment, care needs to be taken to ensure that the precise facts of the arrangement are considered. For example, a transaction where the entity has some discretion over the amount of proceeds attributable to each class of shareholder might indicate that it is inappropriate to treat the entity simply as an agent in the cash payment arrangement. It might also be relevant to consider the extent to which, under relevant local law, the proceeds received can be 'ring fenced' so as not to be available to settle other liabilities of the entity.

It is also the case that arrangements that result in employees obtaining similar amounts of cash can be interpreted very differently under IFRS 2 depending on how the arrangement is structured and whether, for example:

- the entity is required to pay its employees cash on an exit (having perhaps held shares itself via a trust and those shares having been subject to 'drag along' rights); or
- the employees themselves have held the right to equity shares on a restricted basis with vesting – and 'drag along' rights – taking effect on a change of control and the employees receiving cash for their shares.

The appropriate accounting treatment in such cases requires a significant amount of judgement based on the precise facts and circumstances.

15.5 South African black economic empowerment ('BEE') and similar arrangements

As part of general economic reforms in South Africa, arrangements – commonly referred to as black economic empowerment or 'BEE' deals – have been put in place to encourage the transfer of equity, or economic interests in equity, to historically disadvantaged individuals. Similar arrangements have also been put in place in other jurisdictions. These arrangements are intended to give disadvantaged individuals, or entities controlled by disadvantaged individuals, a means of meaningful participation in the economy.

An entity can enhance its BEE status in a number of ways (through employment equity, skills development or preferential procurement policies to name but a few). This section focuses on BEE deals involving transfers of equity instruments, or interests in equity instruments, to historically disadvantaged individuals at a discount to fair value.

Such transfers have generally been concluded at a discount to the fair value of the equity instruments concerned, even where the fair value takes into account any restrictions on these equity instruments. As a result of having empowered shareholders, the reporting entity is able to claim its 'BEE credentials', thus allowing the reporting entity greater business opportunities in the South African economy. These arrangements raise a number of practical issues of interpretation, and indeed led to the scope of IFRS 2 being extended to include transactions where the consideration received appears less than the consideration given, as discussed further at 2.2.2.C above.

The goods or services received from the disadvantaged people or entities controlled by them in return for the equity instruments may or may not be specifically identifiable. As explained in guidance issued by the South African Institute of Chartered Accountants (SAICA),[36] it is therefore the case that IFRS 2 applies to the accounting for BEE transactions where the fair value of cash and other assets received is less than the fair value of equity instruments granted to the BEE partner, i.e. to the BEE equity credentials.

BEE deals are typically complex and their specific structures and terms may vary considerably. However, they do exhibit certain features with some regularity, as discussed below.

Typically BEE arrangements have involved the transfer of equity instruments to:

- empowerment companies controlled by prominent BEE qualifying individuals;
- BEE qualifying employees of the reporting entity; or
- beneficiaries in the BEE qualifying communities in which the entity operates.

The arrangements generally lock the parties in for a minimum specified period and if they want to withdraw they are able to sell their interest only to others with qualifying BEE credentials, usually with the lock-in provision also transferred to the buyer.

Generally these individuals have not been able to raise sufficient finance in order to purchase the equity instruments. Accordingly, the reporting entity often facilitates the transaction and assists the BEE party in securing the necessary financing.

A BEE arrangement often involves the creation of a trust or corporate entity, with the BEE party holding beneficial rights in the trust which in turn holds equity instruments of the reporting entity (or a member of its group).

The awards made by the trust may be in the form of:

- the equity instruments originally transferred to the trust;
- units in the trust itself, usually with a value linked in some way to the value of the equity instruments of the reporting entity originally transferred to the trust; or
- payments made from the proceeds (dividends received, sale of equity instruments etc.) that the trust generates.

The accounting issues arising from such schemes include:

- the nature of the trust (specifically, whether it meets the criteria for consolidation by the reporting entity);
- whether any charge arises under IFRS 2 and, if so, the grant date and therefore, under a grant date model, the amount of the charge; and
- whether awards are equity-settled or cash-settled.

15.5.1 Nature of the trust

The first issue to consider in any accounting analysis is whether any trust to which the equity instruments of the reporting entity have been transferred meets the requirements for consolidation by the reporting entity under IFRS 10 (see Chapter 6). Factors that may indicate that the trust should be consolidated include:

- the reporting entity is involved in the design of the trust and the trust deed at inception, the intention being that the design is such that the desired BEE credentials are obtained;
- the potential beneficiaries of the trust are restricted to persons in the employment of, or otherwise providing services to, the reporting entity;
- the reporting entity has a commitment to ensure that the trust operates as designed in order to maintain its BEE credentials;
- the reporting entity has the right to control (on 'autopilot' or otherwise), or does in practice control, the management of the trust; or
- the relevant activities of the trust are to service the loan and to make distributions to the beneficiaries in line with the trust deed,

but all the IFRS 10 control criteria will need to be assessed.

The generic form of a BEE arrangement normally requires the reporting entity either to finance the acquisition of the shares by the trust or to provide cross guarantees to the financiers of the trust. Alternative methodologies that have been employed include capital enhancements created in the trust by the sale of equity instruments at a severely discounted amount.

When the reporting entity finances the arrangement, the finance is generally interest-free or at a lower than market interest rate. The debt is serviced with the dividends received and, at the end of the repayment period, any outstanding balance can be treated in various ways; refinanced or waived by the reporting entity, or settled by the return of a number of shares equal to the outstanding value.

In summary, the BEE party generally injects only a notional amount of capital into the trust, which obtains financing to acquire the shares in the reporting entity and uses the dividend cash flows to service the debt it has raised. In such generic schemes, the BEE party faces a typical option return profile: the maximum amount of capital at risk is notional and the potential upside increase in value of the shares of the reporting entity accrues to the BEE party through the party's beneficial rights in the trust.

15.5.2 Measurement and timing of the accounting cost

If the analysis under 15.5.1 above is that the trust should be consolidated, the transfer of equity instruments to that entity is essentially the same as a transfer of own equity to an employee benefit trust, as discussed at 12.3 above. Such a transfer, considered alone, is an intra-entity transaction and therefore does not give rise to a charge under IFRS 2. The equity instruments held by the trust are therefore treated as treasury shares, and no non-controlling interests are recognised.

It is only when the trust itself makes an award to a third party that a charge arises, which will be measured at the time at which the grant to the third party occurs. In a rising stock market this will lead to a higher charge than would have occurred had there been a grant, as defined in IFRS 2, on the date that the equity instruments were originally transferred to the trust. Generally, the value of the award is based on an option pricing model and the BEE party is treated as the holder of an option.

Where the trust is not consolidated, the presumption will be that the transfer of equity instruments to the trust crystallises an IFRS 2 charge at the date of transfer. However, it is important to consider the terms of the transaction in their totality. For example, if the entity has the right to buy back the equity instruments at some future date, the benefit transferred may in fact be an economic interest in the equity instruments for a limited period. This may, depending on the method used to determine the buy-back price, influence the measurement of any IFRS 2 charge (which would normally be based on the presumption that the benefits of a vested share had been passed in perpetuity).

Some have sought to argue that BEE credentials result in the recognition of an intangible asset rather than an expense. In order to be recognised as an asset, an entity must have control over the resource as a result of a past event. Paragraphs 13 and 16 of IAS 38 – *Intangible Assets* – indicate that control over an intangible asset may be evidenced in two ways:

- as legal rights that are enforceable by law; or
- as exchange transactions for the same or similar non-contractual customer relationships.

In BEE transactions, a contract is usually entered into with a BEE partner. The contract between the entity and the BEE partner may include a contractual lock-in period or a clause that only allows the transfer of such equity instruments to another BEE partner, usually with the lock-in provision also transferred to the buyer. However, the contract does not provide the entity with legal rights that give it the power to obtain the future economic benefits arising from the BEE transaction, nor the ability to restrict the access of others to those benefits. Therefore, BEE credentials do not qualify for recognition of intangible assets and the difference between the fair value of the award and the consideration received should be expensed. This is consistent with guidance issued by SAICA.[37]

An issue to be considered in determining the timing of the IFRS 2 expense is that many BEE transactions require the BEE party to be 'locked into' the transaction for a pre-determined period. During this period the BEE party or trust is generally prohibited from selling or transferring the equity instruments. As no specific performance is generally required during this period, it is not considered part of the vesting period (see 3.3 and 6.1 above). Rather, the post-vesting restrictions would be taken into account in calculating the fair value of the equity instruments (see 8.4.1 above). This is illustrated in the following example (based in part on Example 5 in the SAICA guidance).

Example 34.67: Receipt of BEE credentials with no service or performance condition

Entity A grants shares with a fair value of $1,000,000 to a BEE consortium for no consideration. As a result of the BEE ownership entity A obtains BEE credentials. The BEE consortium are entitled to the shares immediately and not required to perform any services to entity A nor are any performance conditions required to be met. However, in order to secure the BEE credentials, the consortium may not sell their shares for a period of 7 years from grant date.

In this transaction shares have been issued at a discount to fair value in return for BEE credentials and would fall into the scope of IFRS 2. As there is neither a service nor a performance condition, the fair value of the shares given should be expensed at grant date. The restriction on the transfer of the shares would be treated as a post-vesting restriction and taken into account when estimating the fair value of the equity instruments granted. If the shares in this example were listed, the listed price would not necessarily be the fair value as the fair value would need to be adjusted for the restriction of transfer.

15.5.3 Classification of awards as equity- or cash-settled

Certain schemes, particularly where the reporting entity is not listed, give the BEE party the right to put the shares back to the entity (or another group entity) after a certain date. This is often done to create liquidity for the BEE parties, should they decide to exit the scheme. Such a feature would require the scheme to be classified as cash-settled (see 9.1 above).

Similarly, where the BEE transaction is facilitated through a trust, the trust may have granted awards to beneficiaries in the form of units in the trust. The trustees may have the power to reacquire units from beneficiaries in certain circumstances (e.g. where the beneficiaries are employees, when they leave the employment of the entity). Where the trust does not have sufficient cash with which to make such payments, the reporting entity may be obliged, legally or constructively, to fund them.

Such arrangements may – in their totality – create a cash-settled scheme from the perspective of the reporting entity. In analysing a particular scheme, it should be remembered that, under IFRS 2, cash-settled schemes arise not only from legal liabilities, but also from constructive or commercial liabilities (e.g. to prevent a former employee having rights against what is essentially an employee trust) – see 10.2 above.

Finally, a transaction may be structured in such a way that the trust holds equity instruments of the reporting entity for an indefinite period. Dividends received by the trust may be used to fund certain expenses in a particular community in which the reporting entity operates (e.g. tuition fees for children of the reporting entity's employees or the costs of certain community projects). The scheme may even make provision for the shares to be sold after a certain period with the eventual proceeds being distributed amongst members of the community.

In such a case it is necessary to consider the nature of the distribution requirement and whether or not the reporting entity (through the trust) has a legal or constructive obligation under the scheme to make cash payments based on the price or value of the shares held by the trust. Where there is such an obligation, the arrangement would be classified as a cash-settled scheme. If however the trust merely acts as a conduit through which:

- dividend receipts by the trust are paid out to beneficiaries with the shares never leaving the trust; or
- proceeds from the sale of shares are distributed to beneficiaries,

the precise terms of the arrangement should be assessed to determine whether or not the arrangement meets the definition of a cash-settled share-based payment (see 15.4.6 above for a discussion of similar considerations in the context of 'drag along' and 'tag along' rights).

Any dividend payments by the Group for the period that the trust is consolidated should be treated as an equity distribution or as an expense, as appropriate, in accordance with the principles discussed at 15.3 above.

15.6 Shares used as a currency of payment

Settlement of share-based payment arrangements can take many forms, and in some instances the market value of shares is used as currency to settle the share-based payment transaction. IFRS 2 contains little guidance on how to measure such arrangements. Awards of equity instruments to a fixed monetary value, as discussed above at 8.10, is one example where the market value of the equity instrument at vesting date is used as a currency to settle an award to a fixed value. An award issued to employees of a subsidiary or business unit which is settled by reference to the fair value of shares in another group entity is another example where the market value of shares is used as a currency to settle the share-based payment transaction (see discussion below).

15.6.1 Awards assessed on the market value of a subsidiary or business unit and settled by reference to the fair value of shares in the parent entity

Some entities implement share-based remuneration schemes which aim to reward employees by reference to the 'market' value of the equity of the business unit for which they work as long as service conditions are met. This may arise where the Group might consider the parent's share price to be a somewhat blunt instrument for measuring the performance of the employees of a particular subsidiary or business unit. Indeed, it is not difficult to imagine situations in which a particular subsidiary might perform well but the parent's share price might be dragged down by other factors, or conversely where the parent's share price might rise notwithstanding poor results for that subsidiary. The detail of such schemes varies, but they generally take the form as follows:

- at grant date, the employee is awarded a (real or notional) holding in the equity of the employing subsidiary, the market value of which is measured at grant date and the listed parent will convert the market value of those subsidiary shares at vesting date, into equal value of parent shares to settle the award (scenario 1); or
- the employee is granted an award of as many shares of the listed parent as have a value, at a specified future date (often at, or shortly after, the end of the vesting period but sometimes at a later date), equal to the increase over the vesting period in the market value of the employee's (notional) holding in the equity of the employing subsidiary, otherwise known as share-settled share appreciation rights (akin to an option granted to the employee that is settled in the parent's shares) (scenario 2).

In the two scenarios above, the parent's shares are used as a currency to settle an arrangement with the subsidiary employees that is not dependent on the parent's share price. The share price of the parent's shares is used to determine the number of parent shares that will be issued on settlement. Put another away, the parent's share price (either at grant date or subsequently) should not affect measurement of the award (see 8.10 above).

After grant date, IFRS 2 requires remeasurement of an equity-settled share-based payment transaction only for changes in the service condition being met and other non-market vesting conditions. There is no remeasurement after grant date for market vesting conditions and non-vesting conditions. Therefore, an important feature in accounting for the awards in the scenarios outlined above is to assess, whether the basis on which the subsidiary equity is valued truly yields a market price (or value) to determine the type of performance conditions attached to the awards.

If the basis on which the subsidiary equity is valued yields a 'market value', the awards in the two scenarios are considered as containing only a service condition, and those awards would not be considered as containing a non-market vesting condition or market vesting condition (there is no specific target share price to be achieved). The awards are measured at grant date using valuation inputs related to the subsidiary's share price and are not remeasured. The fair value at vesting date is used as a conversion feature to determine the number of parent shares to be received as an exit mechanism, and the employee is receiving 'value for value'. The expense recognised is only adjusted for the failure to meet vesting conditions other than market conditions (e.g. service conditions).

If the 'market value' of the subsidiary is based on a constant formula (e.g. an EBITDA multiple), an assessment is required whether that formula provides a good surrogate for the market value of the subsidiary on an ongoing basis (see 2.2.4.F above). If deemed not to provide a good surrogate for the market value, the awards outlined in the scenarios above could then be considered as containing a non-market vesting condition and the expense recognised would be equal to the number of equity instruments that vest (see 3.1 above). If the formula used to determine the number of shares to be awarded can be determined sometime after the employee has satisfied the service vesting condition then the formula driven condition would be treated as a non-vesting condition (see 3.2 above). In contrast to the approach used to measure the non-market vesting condition, the non-vesting condition is taken into account in estimating the fair value of the award granted and not subsequently remeasured. The expense recognised is only adjusted for the failure to meet vesting conditions other than market conditions (e.g. service conditions).

16 FIRST-TIME ADOPTION AND TRANSITIONAL PROVISIONS

16.1 First-time adoption provisions

The requirements of IFRS 1 – *First-time Adoption of International Financial Reporting Standards* – in relation to share-based payment arrangements are discussed in Chapter 5 at 5.3. However, one provision may remain relevant for entities that have already adopted IFRS and would no longer generally be considered 'first-time adopters'.

IFRS 1 does not require an entity to account for equity-settled transactions:

- granted on or before 7 November 2002; or
- granted after 7 November 2002 but vested before the later of the date of transition to IFRS and 1 January 2005.

However, where such an award is modified, cancelled or settled, the rules regarding modification, cancellation and settlement (see 7 above) apply in full unless the modification occurred before the date of transition to IFRS. *[IFRS 1.D2]*. The intention of this provision is to prevent an entity from avoiding the recognition of a cost for a new award by structuring it as a modification to an earlier award not in the scope of IFRS 2.

There is slight ambiguity on this point in the wording of IFRS 1, paragraph D2 of which refers only to the modification of such awards. However, paragraph D2 also requires an entity to apply 'paragraphs 26-29' of IFRS 2 to 'modified' awards. Paragraphs 26-29 deal not only with modification but also with cancellation and settlement, and indeed paragraphs 28 and 29 are not relevant to modification at all. This makes it clear, in our view, that the IASB intended IFRS 1 to be applied not only to the modification but also to the cancellation and settlement of such awards.

Chapter 35 Employee benefits

1 INTRODUCTION 2891

2 OBJECTIVE AND SCOPE OF IAS 19 2891

- 2.1 Objective 2891
- 2.2 Scope 2892
  - 2.2.1 General scope requirements of IAS 19 2892
  - 2.2.2 Employee benefits settled by a shareholder or another group entity 2893

3 PENSIONS AND OTHER POST-EMPLOYMENT BENEFITS – DEFINED CONTRIBUTION AND DEFINED BENEFIT PLANS 2894

- 3.1 The distinction between defined contribution plans and defined benefit plans 2894
- 3.2 Insured benefits 2896
- 3.3 Multi-employer plans 2898
  - 3.3.1 Multi-employer plans other than plans sharing risks between entities under common control 2898
    - 3.3.1.A The treatment of multi-employer plans 2898
    - 3.3.1.B What to do when 'sufficient information' becomes available 2899
    - 3.3.1.C Withdrawal from or winding up of a multi-employer scheme 2900
  - 3.3.2 Defined benefit plans sharing risks between entities under common control 2900
- 3.4 State plans 2901
- 3.5 Plans that would be defined contribution plans but for the existence of a minimum return guarantee 2902
- 3.6 Death-in-service benefits 2903

4 DEFINED CONTRIBUTION PLANS 2906

- 4.1 General accounting requirements 2906

4.2 Defined contribution plans with vesting conditions 2907

5 DEFINED BENEFIT PLANS – GENERAL 2907

6 DEFINED BENEFIT PLANS – PLAN ASSETS 2908

6.1 Definition of plan assets 2908
6.2 Measurement of plan assets 2910
6.3 Qualifying insurance policies 2910
6.4 Reimbursement rights 2910
6.5 Contributions to defined benefit funds 2910
6.6 Longevity swaps 2911

7 DEFINED BENEFIT PLANS – PLAN LIABILITIES 2912

7.1 Legal and constructive obligations 2912
7.2 Contributions by employees and third parties 2913
7.3 Actuarial methodology 2917
7.4 Attributing benefit to years of service 2918
7.5 Actuarial assumptions 2922
7.6 Discount rate 2924
  7.6.1 High quality corporate bonds 2926
  7.6.2 No deep market 2927
7.7 Frequency of valuations 2928

8 DEFINED BENEFIT PLANS – TREATMENT OF THE PLAN SURPLUS OR DEFICIT IN THE STATEMENT OF FINANCIAL POSITION 2929

8.1 Net defined benefit liability (asset) 2929
8.2 Restriction of assets to their recoverable amounts 2929
  8.2.1 IFRIC Interpretation 14 – general requirements concerning the limit on a defined benefit asset 2931
  8.2.2 Economic benefits available as reduced future contributions when there are no minimum funding requirements for future service 2932
  8.2.3 IFRIC Interpretation 14 – the effect of a minimum funding requirement on the economic benefit available as a reduction in future contributions 2933
  8.2.4 IFRIC Interpretation 14 – when a minimum funding requirement may give rise to a liability 2936
  8.2.5 Pension funding payments contingent on future events within the control of the entity 2938

9 DEFINED BENEFIT PLANS – PRESENTATION OF THE NET DEFINED BENEFIT LIABILITY (ASSET) 2939

10 DEFINED BENEFIT PLANS – TREATMENT IN PROFIT OR LOSS AND OTHER COMPREHENSIVE INCOME 2940

10.1 Service cost 2940

10.2 Changes in a defined benefit plan 2941

10.2.1 Past service cost 2942

10.2.2 Acquisition of a qualifying insurance policy 2943

10.2.3 Settlements 2943

10.3 Net interest on the net defined benefit liability (asset) 2945

10.4 Remeasurements 2946

10.4.1 Actuarial gains and losses 2946

10.4.2 The return on plan assets, excluding amounts included in net interest on the net defined benefit liability (asset) 2946

11 DEFINED BENEFIT PLANS – COSTS OF ADMINISTERING EMPLOYEE BENEFIT PLANS 2946

12 SHORT-TERM EMPLOYEE BENEFITS 2947

12.1 General recognition criteria for short-term employee benefits 2948

12.2 Short-term paid absences 2948

12.2.1 Accumulating absences 2948

12.2.2 Non-accumulating paid absences 2949

12.3 Profit-sharing and bonus plans 2949

12.3.1 Present legal or constructive obligation 2949

12.3.2 Reliable estimate of provision 2950

12.3.3 Statutory profit-sharing based on taxable profit. 2950

13 LONG-TERM EMPLOYEE BENEFITS OTHER THAN POST-EMPLOYMENT BENEFITS 2951

13.1 Meaning of other long-term employee benefits 2951

13.2 Recognition and measurement 2951

13.2.1 Attribution to years of service 2952

13.2.2 Long-term disability benefit 2952

13.2.3 Long-term benefits contingent on a future event 2953

14 TERMINATION BENEFITS 2953

14.1 Statutory termination indemnities 2955

14.2 Recognition 2955

14.3 Measurement 2956

15 DISCLOSURE REQUIREMENTS 2957

15.1 Defined contribution plans 2957

15.2 Defined benefit plans 2957

15.2.1 Characteristics of defined benefit plans and risks associated with them 2958

15.2.2 Explanation of amounts in the financial statements 2959

15.2.3 Amount, timing and uncertainty of future cash flows 2962

15.2.4 Multi-employer plans 2964
15.2.4.A Plans accounted for as defined benefit plans 2964
15.2.4.B Plans accounted for as defined contribution plans 2964
15.2.5 Defined benefit plans that share risks between entities under common control 2965
15.2.5.A Plans accounted for as defined benefit plans 2965
15.2.5.B Plans accounted for as defined contribution plans 2965
15.2.6 Disclosure requirements in other IFRSs 2967
15.3 Other employee benefits 2967
16 POSSIBLE FUTURE DEVELOPMENTS 2968
16.1 IASB activities 2968
16.2 Interpretations Committee activities 2968
16.2.1 The availability of a refund from a defined benefit plan 2968

List of examples

Example 35.1: Defined benefit plan with employee contributions, where the discount rate is higher than the salary growth rate 2915
Example 35.2: The projected unit credit method 2917
Example 35.3: Attributing benefits to years of service 2920
Example 35.4: Deficit-clearing future minimum funding requirements when refunds are not available 2934
Example 35.5: Effect of a prepayment when a minimum funding requirement exceeds the expected future service charge 2936
Example 35.6: Effect of the minimum funding requirement when there is an IAS 19 surplus and the minimum funding contributions payable are fully refundable to the entity 2937
Example 35.7: Effect of a minimum funding requirement when there is an IAS 19 deficit and the minimum funding contributions payable would not be fully available 2937
Example 35.8: Accumulating paid absences 2949
Example 35.9: Profit sharing and bonus plans 2950
Example 35.10: Termination benefits 2956

Chapter 35 Employee benefits

1 INTRODUCTION

This Chapter deals with IAS 19 – *Employee Benefits* – as published in June 2011 and most recently amended in February 2018. Predecessors of this standard are discussed in earlier editions of International GAAP.

Employee benefits typically form a very significant part of any entity's costs, and can take many and varied forms. Accordingly, IFRS devotes considerable attention to them in two separate standards. IFRS 2 – *Share-based Payment* – is discussed in Chapter 34. All other employee benefits are dealt with in IAS 19.

Many issues raised in accounting for employee benefits can be straightforward, such as the allocation of wages paid to an accounting period, and are generally dealt with by IAS 19 accordingly. In contrast, accounting for the costs of retirement benefits in the financial statements of employers presents a more difficult challenge. The amounts involved are large, the timescale is long, the estimation process is complex and involves many areas of uncertainty which have to be made the subject of assumptions. Furthermore, the complexities for an International Standard are multiplied by the wide variety of arrangements found in different jurisdictions.

2 OBJECTIVE AND SCOPE OF IAS 19

2.1 Objective

IAS 19 sets out its objective as follows:

'The objective of this Standard is to prescribe the accounting and disclosure for employee benefits. The Standard requires an entity to recognise:

(a) a liability when an employee has provided service in exchange for employee benefits to be paid in the future; and

(b) an expense when the entity consumes the economic benefit arising from service provided by an employee in exchange for employee benefits.' *[IAS 19.1]*.

This provides the overarching principle of the standard. Driven by the focus on assets and liabilities in the IASB's *Conceptual Framework* (which is discussed in Chapter 2), it approaches the issues from the perspective of the statement of financial position of the entity.

2.2 Scope

The general scope of the standard is dealt with at 2.2.1 below. The issue of employee benefits settled not by the employing entity but by a shareholder or other member of a group is discussed at 2.2.2 below.

2.2.1 General scope requirements of IAS 19

As its name suggests, IAS 19 is not confined to pensions and other post-retirement benefits, but rather addresses all forms of consideration (apart from share-based payments which are dealt with by IFRS 2 and discussed in Chapter 34) given by an employer in exchange for service rendered by employees or for the termination of employment. *[IAS 19.2, 8]*. In particular, in addition to post-retirement benefits employee benefits it includes: *[IAS 19.5]*

(a) short-term benefits, including wages and salaries, paid annual leave, bonuses, benefits in kind, etc. The accounting treatment of these is discussed at 12 below;

(b) other long-term benefits, such as long-service leave, long-term disability benefits, long-term bonuses, etc. These are to be accounted for in a similar, but not identical, way to post-retirement benefits by using actuarial techniques and are discussed at 13 below; and

(c) termination benefits. These are to be provided for and expensed when the employer becomes committed to the redundancy plan, on a similar basis to that required by IAS 37 – *Provisions, Contingent Liabilities and Contingent Assets* – for provisions generally, and are discussed at 14 below.

The standard addresses only the accounting by employers, and excludes from its scope reporting by employee benefit plans themselves. These are dealt with in IAS 26 – *Accounting and Reporting by Retirement Benefit Plans*. *[IAS 19.3]*. The specialist nature of these requirements puts them beyond the scope of this book.

The standard makes clear it applies widely and in particular to benefits:

(a) provided to all employees (whether full-time, part-time, permanent, temporary or casual staff and specifically including directors and other management personnel); *[IAS 19.7]*

(b) however settled, including payments in cash or goods or services, whether paid directly to employees, their spouses, children or other dependants or any other party (such as insurance companies); *[IAS 19.6]* and

(c) however provided, including:

  (i) under formal plans or other formal agreements between an entity and individual employees, groups of employees or their representatives;

  (ii) under legislative requirements, or through industry arrangements, whereby entities are required to contribute to national, state, industry or other multi-employer plans; or

  (iii) by those informal practices that give rise to a constructive obligation, that is where the entity has no realistic alternative but to pay employee benefits. An example of a constructive obligation is where a change in the entity's informal practices would cause unacceptable damage to its relationship with employees. *[IAS 19.4]*.

The standard does not define the term 'employee'. However, it is clear from the reference in (a) above to 'full-time, part-time, permanent, casual or temporary' staff and specifically including directors and other management personnel that the term is intended to apply widely. In particular, it is not necessary for there to be a contract of employment in order for an individual to be considered an employee for IAS 19 purposes, other indicators should also be considered such as:

- the individual is considered an employee for tax purposes;
- services must be performed by a particular individual who has no discretion to arrange for someone else to perform them;
- services must be performed at a location specified by the entity;
- there is a large amount of oversight and direction by the entity;
- necessary tools, equipment and materials are provided by the entity;
- individuals are paid on a time basis, rather than a project/fixed price basis; and
- individuals receive benefits of a nature typical for employees (e.g. paid holidays, paid sick leave, post-retirement benefits, or death and disability benefits).

In our view, the standard applies to anyone who is in substance an employee, and that will be a matter of judgement in light of all the facts and circumstances.

An example of benefits which may be under the scope of either IAS 19 or IFRS 2 includes a cash bonus dependent on share performance (see Chapter 34 at 2.2.4.E). Cash settled awards based on an entity's enterprise value would be under the scope of IAS 19 if the enterprise value used in the calculation did not represent the fair value of the entity's equity instruments (see Chapter 34 at 2.2.4.F). Cash bonuses may also be within the scope of both IAS 19 and IFRS 2 if they require a mandatory investment of part of the bonus into shares (see Chapter 34 at 15.1). The cash element paid would fall within the scope of IAS 19, whereas any bonus which results in a required or discretionary investment in shares would come under the scope of IFRS 2. Each element of a bonus would be under the scope of one of these standards, but not both standards.

2.2.2 Employee benefits settled by a shareholder or another group entity

In some circumstances, employee benefits may be settled by a party other than the entity to which services were rendered by employees. Examples would include a shareholder or another entity in a group of entities under common control.

IAS 19 is silent on whether, and if so how, an entity receiving employee services in this way should account for them. IFRS 2, on the other hand, devotes quite some detail to this topic for employee services within its scope.

An entity could make reference to the hierarchy in IAS 8 – *Accounting Policies, Changes in Accounting Estimates and Errors* (discussed in Chapter 3 at 4.3) when deciding on an accounting policy under IAS 19. Accordingly, these provisions of IFRS 2 could be applied by analogy to transactions within the scope of IAS 19.

The relevant requirements of IFRS 2 are discussed in Chapter 34 at 2.2.2.A and at 12.

3 PENSIONS AND OTHER POST-EMPLOYMENT BENEFITS – DEFINED CONTRIBUTION AND DEFINED BENEFIT PLANS

3.1 The distinction between defined contribution plans and defined benefit plans

IAS 19 draws the important distinction between defined contribution plans and defined benefit plans. The determination is made based on the economic substance of the plan as derived from its principal terms and conditions. *[IAS 19.27]*. The approach it takes is to define defined contribution plans, with the defined benefit plans being the default category. The relevant terms defined by the standard are as follows: *[IAS 19.8]*

'*Post-employment benefits* are employee benefits (other than termination benefits and short-term employee benefits) that are payable after the completion of employment'.

'*Post-employment benefit plans* are formal or informal arrangements under which an entity provides post-employment benefits for one or more employees'.

'*Defined contribution plans* are post-employment benefit plans under which an entity pays fixed contributions into a separate entity (a fund) and will have no legal or constructive obligation to pay further contributions if the fund does not hold sufficient assets to pay all employee benefits relating to employee service in the current and prior periods'.

'*Defined benefit plans* are post-employment benefit plans other than defined contribution plans'.

IAS 19 applies to all post-employment benefits (whether or not they involve the establishment of a separate entity to receive contributions and pay benefits) which include, for example, retirement benefits such as pensions; and post-employment life assurance or medical care. *[IAS 19.26]*. A less common benefit is the provision of services.

Under defined benefit plans the employer's obligation is not limited to the amount that it agrees to contribute to the fund. Rather, the employer is obliged (legally or constructively) to provide the agreed benefits to current and former employees. Examples of defined benefit schemes given by IAS 19 are: *[IAS 19.29]*

(a) plans where the benefit formula is not linked solely to the amount of contributions and requires the entity to provide further contributions if assets are insufficient to meet the benefits in the plan formula;

(b) guarantees, either directly or indirectly through a plan, of a specified return on contributions; and

(c) those informal practices that give rise to a constructive obligation, such as a history of increasing benefits for former employees to keep pace with inflation even where there is no legal obligation to do so.

The most significant difference between defined contribution and defined benefit plans is that, under defined benefit plans, some actuarial risk or investment risk (or both) falls, in substance, on the employer. This means that if actuarial or investment experience is worse than expected, the employer's obligation may be increased. *[IAS 19.30]*. Consequently, because the employer is in substance underwriting the actuarial and investment risks associated with the plan, the expense recognised for a defined benefit plan is not necessarily the amount of the contribution due for the period. *[IAS 19.56]*. Conversely, under defined contribution plans the benefits received by the employee are determined by the amount of contributions paid (either by the employer, the employee or both) to the benefit plan or insurance company, together with investment returns, and hence actuarial and investment risk fall in substance on the employee. *[IAS 19.28]*.

In 2019 the Interpretations Committee received a request concerning the classification of a post-employment benefit plan that is administered by a third party. The only relevant terms and conditions in the request were that:

- the entity has an obligation to pay fixed annual contributions into the plan. The entity has determined that it will have no legal or constructive obligation to pay further contributions into the plan if it does not hold sufficient assets to pay all employee benefits relating to employee service in current and prior periods; and
- the entity is entitled to a potential discount on its annual contributions if the ratio of plan assets to plan liabilities exceeds a set level.

The Interpretations Committee was asked to consider whether the existence of a right to a potential discount would result in classification as a defined benefit plan under IAS 19. The Committee concluded that based on the fact pattern provided in the request the existence of a right to a potential discount would not in itself result in the classification as a defined benefit plan. However, they re-iterated the importance of assessing all the relevant terms and conditions of a plan, as well as any informal practices that might give rise to a constructive obligation, in the classification of a plan. The Committee also concluded that the requirements of IAS 19 provide an adequate basis for an entity to determine the classification of a post-employment benefit plan as a defined contribution plan or a defined benefit plan and decided not to add this matter to its standard-setting agenda.[1]

The committee reached this conclusion through consideration of the definition of a defined contribution plan, which requires:

- contributions to be fixed with no further legal or constructive obligation to pay further contributions if the fund does not hold sufficient assets to pay all employee benefits; *[IAS 19.8]*
- that this does not exclude the upside potential where the cost to the entity may be less than expected; *[IAS 19.BC29]* and
- the fact that in a defined contribution scheme the actuarial risk falls in substance on the employee. *[IAS 19.28, 30]*.

The classification of plans such as those described in the fact pattern submitted will require careful consideration of all the facts and circumstances to determine whether actuarial risk has remained with the employer and a defined benefit classification is appropriate. An entity should also consider whether any significant judgements made in this determination should be disclosed in accordance with IAS 1 – *Presentation of Financial Statements*. *[IAS 1.122]*.

3.2 Insured benefits

One factor that can complicate making the distinction between defined benefit and defined contribution plans is the use of external insurers. IAS 19 recognises that some employers may fund their post-employment benefit plans by paying insurance premiums and observes that the benefits insured need not have a direct or automatic relationship with the entity's obligation for employee benefits. However, it makes clear that post-employment benefit plans involving insurance contracts are subject to the same distinction between accounting and funding as other funded plans. *[IAS 19.47]*.

Where insurance premiums are paid to fund post-employment benefits, the employer should treat the plan as a defined contribution plan unless it has (either directly or indirectly through the plan) a legal or constructive obligation to:

(a) pay the employee benefits directly when they fall due; or

(b) pay further amounts if the insurer does not pay all future employee benefits relating to employee service in the current and prior periods.

If the employer has retained such a legal or constructive obligation it should treat the plan as a defined benefit plan. *[IAS 19.46]*. In setting out how to apply defined benefit accounting, however, the standard refers to slightly different criteria to determine whether a legal or constructive obligation is retained. Rather than referring to 'either directly or indirectly through the plan', paragraph 48 of IAS 19 refers to 'the entity (either directly, indirectly through the plan, *through the mechanism for setting future premiums or through a related party relationship with the insurer*) retains a legal or constructive obligation' (emphasis added). *[IAS 19.48]*. In our view the additional text included with paragraph 48 should also be applied in paragraph 46.

In cases where such obligations are retained by the employer, it recognises its rights under a 'qualifying insurance policy' as a plan asset and recognises other insurance policies as reimbursement rights. *[IAS 19.48]*. Plan assets are discussed at 6 below.

By way of final clarification, the standard notes that where an insurance policy is in the name of a specified plan participant or a group of plan participants and the employer does not have any legal or constructive obligation to cover any loss on the policy, the employer has no obligation to pay benefits to the employees and the insurer has sole responsibility for paying the benefits. In that case, the payment of fixed premiums under such contracts is, in substance, the settlement of the employee benefit obligation, rather than an investment to meet the obligation. Consequently, the employer no longer has an asset or a liability. Accordingly, it should treat the payments as contributions to a defined contribution plan. *[IAS 19.49]*. The important point here is that employee entitlements will be of a defined benefit nature unless the employer has no obligation whatsoever to pay them should the insurance fail or otherwise be insufficient.

The analysis of insured plans given in the standard, which is described above, along with the definition of defined benefit and defined contribution plans seems comprehensive at first glance. However, there will be circumstances where the distinction may not be so apparent and careful analysis may be required. For example, it is possible that an employer buys insurance on a regular basis (say annually), retaining no further obligation in respect of the benefits insured, but has an obligation (legal or constructive) to keep doing so in the future. In such a scenario, the employer may be exposed to future actuarial variances reflected in a variable cost of purchasing the required insurance in future years (for example, due to changing mortality estimates by the insurer).

Another scenario would be where each year the employee earns an entitlement to a pension of (say) 2% of that year's (i.e. current as opposed to final) salary and the employer purchases each year an annuity contract to commence on the date of retirement.

In our view, the standard is not entirely clear as to the nature of such an arrangement. On the one hand, it could be argued that it is a defined contribution plan because the definition of defined contribution plans is met when:

- 'fixed' payments are paid to a separate fund; and
- the employer is not obliged to pay further amounts if the fund has insufficient assets to pay the benefits relating to employee service in the current and prior periods.

Further, as noted above the standard considers the payment of 'fixed' premiums to purchase insurance specific to an employee (or group thereof) with no retention of risk in respect of the insured benefits to be a defined contribution arrangement.

On the other hand, it could be argued that this is a defined benefit plan on the grounds that:

- the premiums of future years are not 'fixed' in any meaningful sense (certainly not in the same way as an intention simply to pay a one-off contribution of a given % of salary);
- the standard acknowledges that one factor that can mean insured arrangements are defined benefit in nature is when the employer retains an obligation indirectly through the mechanism for setting future premiums; *[IAS 19.48]* and
- the standard observes that under defined benefit plans '... actuarial risk (that benefits will cost more than expected) and investment risk fall, in substance, on the entity. If actuarial or investment experience are worse than expected, the entity's obligation may be increased'. *[IAS 19.30]*.

Much would seem to depend on just what 'fixed' means in such circumstances. Although not expressly addressed by the standard, in our view such arrangements will very likely be defined benefit in nature, albeit with regular (and perhaps only partial) settlement and, if so, should be accounted for as such. This is because the employer has retained actuarial risks by committing to pay whatever it takes in future years to secure the requisite insurance. See 3.1 above for further discussion on 'fixed' contributions. Naturally, for any schemes that are determined to be defined benefit plans, the next step would be to see whether the frequent settlement renders the output of the two accounting models materially the same. That would depend, *inter alia*, on the attribution of the benefit to years of service and the impact of an unwinding discount.

The wide variety of possible arrangements in practice mean that careful consideration of individual circumstances will be required to determine the true substance of such arrangements.

3.3 Multi-employer plans

3.3.1 Multi-employer plans other than plans sharing risks between entities under common control

3.3.1.A The treatment of multi-employer plans

Multi-employer plans, other than state plans (see 3.4 below), under IAS 19 are defined contribution plans or defined benefit plans that:

(a) pool assets contributed by various entities that are not under common control; and

(b) use those assets to provide benefits to employees of more than one entity, on the basis that contribution and benefit levels are determined without regard to the identity of the entity that employs the employees. *[IAS 19.8].*

Accordingly, they exclude group administration plans, which simply pool the assets of more than one employer, for investment purposes and the reduction of administrative and investment costs, but keep the claims of different employers segregated for the sole benefit of their own employees. The standard observes that group administration plans pose no particular accounting problems because information is readily available to treat them in the same way as any other single employer plan and because they do not expose the participating employers to actuarial risks associated with the current and former employees of other entities. Accordingly, the standard requires group administration plans to be classified as defined contribution plans or defined benefit plans in accordance with the terms of the plan (including any constructive obligation that goes beyond the formal terms). *[IAS 19.38].*

The standard gives a description of one example of a multi-employer scheme as follows:

(a) the plan is financed on a pay-as-you-go basis: contributions are set at a level that is expected to be sufficient to pay the benefits falling due in the same period; and future benefits earned during the current period will be paid out of future contributions; and

(b) employees' benefits are determined by the length of their service and the participating entities have no realistic means of withdrawing from the plan without paying a contribution for the benefits earned by employees up to the date of withdrawal. Such a plan creates actuarial risk for the entity: if the ultimate cost of benefits already earned at the end of the reporting period is more than expected, it will be necessary for the entity either to increase its contributions or persuade employees to accept a reduction in benefits. Therefore, such a plan is a defined benefit plan. *[IAS 19.35].*

A multi-employer plan should be classified as either a defined contribution plan or a defined benefit plan in accordance with its terms in the normal way (see 3.1 above). *[IAS 19.32].* If a multi-employer plan is classified as a defined benefit plan, IAS 19 requires that the employer should account for its proportionate share of the defined benefit obligation, plan assets and costs associated with the plan in the same way as for any other defined benefit plan (see 5-11 below). *[IAS 19.33, 36].*

The standard does, however, contain a practical exemption if insufficient information is available to use defined benefit accounting. This could be the case, for example, where:

(a) the entity does not have access to information about the plan that satisfies the requirements of the standard; or

(b) the plan exposes the participating entities to actuarial risks associated with the current and former employees of other entities, with the result that there is no consistent and reliable basis for allocating the obligation, plan assets and cost to individual entities participating in the plan. *[IAS 19.36]*.

In such circumstances, an entity should account for the plan as if it were a defined contribution plan and make the disclosures set out at 15.2.4 below. *[IAS 19.34, 36]*.

The standard notes that there may be a contractual agreement between the multi-employer plan and its participants that determines how the surplus in the plan will be distributed to the participants (or the deficit funded). In these circumstances, an entity participating in such a plan, and accounting for it as a defined contribution plan (as described above), should recognise the asset or liability arising from the contractual agreement and the resulting income or expense in profit or loss. *[IAS 19.37]*. The standard illustrates this with an example of an entity participating in a multi-employer defined benefit plan which it accounts for as a defined contribution plan because no IAS 19 valuations are prepared. A non-IAS 19 funding valuation shows a deficit of CU100 million in the plan. A contractual schedule of contributions has been agreed with the participating employers in the plan that will eliminate the deficit over the next five years. The entity's total contributions to eliminate the deficit under the contract are CU8 million. IAS 19 requires the entity to recognise immediately a liability for the contributions adjusted for the time value of money and an equal expense in profit or loss. The important point here is that the standard makes clear that 'defined contribution accounting' is not the same as cash accounting. Extra payments to make good a deficit should be provided for immediately when they are contracted for.

3.3.1.B What to do when 'sufficient information' becomes available

As discussed above, IAS 19 requires a multi-employer defined benefit plan to be treated for accounting purposes as a defined contribution plan when insufficient information is available to use defined benefit accounting. The standard does not address the accounting treatment required when that situation changes because sufficient information becomes available in a period. Two possible approaches present themselves:

(a) an immediate charge/credit to profit or loss equal to the deficit/surplus; or

(b) an actuarial gain or loss recognised on other comprehensive income.

Arguments in favour of (a) would be that for accounting purposes the scheme was a defined contribution scheme. Accordingly, starting defined benefit accounting is akin to introducing a new scheme. The defined benefit obligation recognised is essentially a past service cost. In addition, as discussed at 3.3.1.A above, the standard clarifies that while defined contribution accounting is being applied an asset or liability should be recognised where there is a contractual arrangement to share a surplus or fund a deficit. The receipt of full information could be considered to represent such an arrangement and hence require full recognition in the statement of financial position with an equivalent entry in profit or loss.

Arguments for (b) would be that the scheme has not changed and that defined contribution accounting was a proxy (and best available estimate) for what the defined benefit accounting should have been. Accordingly, any change to that estimate due to the emergence of new information is an actuarial variance which is recognised in other comprehensive income.

Given the ambiguity of the standard either approach is acceptable if applied consistently.

3.3.1.C Withdrawal from or winding up of a multi-employer scheme

IAS 19 requires the application of IAS 37 to determine when to recognise and how to measure a liability relating to the withdrawal from, or winding-up of, a multi-employer scheme. *[IAS 19.39]*.

3.3.2 Defined benefit plans sharing risks between entities under common control

IAS 19 provides that defined benefit plans that share risks between various entities under common control, for example a parent and its subsidiaries, are not multi-employer plans. *[IAS 19.40]*.

The test, described earlier, for allowing a defined benefit multi-employer plan to be accounted for as a defined contribution plan is that insufficient information is available. By completely excluding entities that are under common control from the definition of multi-employer plans the standard is essentially saying that for these employers sufficient information is deemed always to be available – at least for the plan as a whole. The standard requires an entity participating in such a plan to obtain information about the plan as a whole measured in accordance with IAS 19 on the basis of assumptions that apply to the plan as a whole. *[IAS 19.41]*. Whilst a subsidiary may not be in a position to demand such information (any more than participants in schemes described at 3.3.1 above), the standard is essentially saying that the parent must make the information available if it wants the subsidiary to be able to comply with IAS 19.

The standard then goes on to specify the accounting treatment to be applied in the individual financial statements of the participating entities. The standard states: 'If there is a contractual agreement or stated policy for charging to individual group entities the net defined benefit cost for the plan as a whole measured in accordance with this Standard, the entity shall, in its separate or individual financial statements, recognise the net defined benefit cost so charged. If there is no such agreement or policy, the net defined benefit cost shall be recognised in the separate or individual financial statements of the group entity that is legally the sponsoring employer for the plan. The other group entities shall, in their separate or individual financial statements, recognise a cost equal to their contribution payable for the period'. *[IAS 19.41]*. This seems to raise more questions than it answers. For example, it provides no clarity on what is meant by:

- the 'net defined benefit cost ... measured in accordance with [IAS 19]'. In particular, are actuarial gains and losses part of this 'net cost'?
- an entity that 'is legally the sponsoring employer for the plan'. The pan-jurisdictional scope of IFRS makes such a determination particularly difficult. Furthermore, it suggests that there is only one such legal sponsor – which may not be the case in practice.

A further difficulty with these provisions of the standard is whether it is ever likely in practice that entities would be charged an amount based on the 'defined benefit cost measured in accordance with [IAS 19]'. Naturally, situations vary not just across, but also within, individual jurisdictions. However, it is typically the case that funding valuations will not be on an IAS 19 basis, so that any amounts 'charged' will not be measured in accordance with IAS 19. Indeed, as discussed at 3.3.1 above, the standard gives non-IAS 19 funding valuations in a multi-employer plan as a reason why sufficient information to allow defined benefit accounting is not available.

Some further insight as to the IASB's intentions can be found in the Basis for Conclusions to the standard.

'The Board noted that, if there were a contractual agreement or stated policy on charging the net defined benefit cost to group entities, that agreement or policy would determine the cost for each entity. If there is no such contractual agreement or stated policy, the entity that is the sponsoring employer bears the risk relating to the plan by default. The Board therefore concluded that a group plan should be allocated to the individual entities within a group in accordance with any contractual agreement or stated policy. If there is no such agreement or policy, the net defined benefit cost is allocated to the sponsoring employer. The other group entities recognise a cost equal to any contribution collected by the sponsoring employer. This approach has the advantages of (a) all group entities recognising the cost they have to bear for the defined benefit promise and (b) being simple to apply'. *[IAS 19.BC48-49]*.

This analysis is particularly noteworthy in these respects:

(a) there is no mention of amounts charged being measured in accordance with IAS 19. Indeed, the third sentence refers to any such agreement or stated policy;

(b) the focus is not on 'amounts charged' but rather an 'allocation' of the scheme across entities;

(c) references are to a 'sponsoring employer' crucially not a legally sponsoring employer. The term is slightly clarified by the explanation that a sponsoring employer is one that by default bears the 'risks relating to the plan'; and

(d) the discussion of employers other than the sponsoring employer is explicitly by reference to 'amounts collected'.

Given the ambiguities in the standard we expect that, for entities applying IFRS at an individual company level, there may well be divergent treatments in practice.

The standard makes clear that, for each individual group entity, participation in such a plan is a related party transaction. Accordingly, the disclosures set out at 15.2.5 below are required. *[IAS 19.42]*.

3.4 State plans

IAS 19 observes that state plans are established by legislation to cover all entities (or all entities in a particular category, for example a specific industry) and are operated by national or local government or by another body (for example an autonomous agency created specifically for this purpose) which is not subject to control or influence by the reporting entity. *[IAS 19.44]*. The standard requires that state plans be accounted for in the same way as for a multi-employer plan (see 3.3.1 above). *[IAS 19.43]*. It goes on to note that it is characteristic of many state plans that:

- they are funded on a pay-as-you-go basis with contributions set at a level that is expected to be sufficient to pay the required benefits falling due in the same period; and
- future benefits earned during the current period will be paid out of future contributions.

Nevertheless, in most state plans, the entity has no legal or constructive obligation to pay those future benefits: its only obligation is to pay the contributions as they fall due and if the entity ceases to employ members of the state plan, it will have no obligation to pay the benefits earned by its own employees in previous years. For this reason, the standard considers that state plans are normally defined contribution plans. However, in cases when a state plan is a defined benefit plan, IAS 19 requires it to be treated as such as a multi-employer plan. *[IAS 19.45]*.

Some plans established by an entity provide both compulsory benefits which substitute for benefits that would otherwise be covered under a state plan and additional voluntary benefits. IAS 19 clarifies that such plans are not state plans. *[IAS 19.44]*.

3.5 Plans that would be defined contribution plans but for the existence of a minimum return guarantee

It is common in some jurisdictions for the employer to make contributions to a defined contribution post-employment benefit plan and to guarantee a minimum level of return on the assets in which the contributions are invested. In other words, the employee enjoys upside risk on the investments but has some level of protection from downside risk.

The existence of such a guarantee means the arrangement fails to meet the definition of a defined contribution plan (see 3.1 above) and accordingly is a defined benefit plan. Indeed, the standard is explicit, as it uses plans which guarantee a specified return on contributions as an example of a defined benefit arrangement. *[IAS 19.29(b)]*. The somewhat more difficult issue is how exactly to apply defined benefit accounting to such an arrangement, as this would require projecting forward future salary increases and investment returns, and discounting these amounts at corporate bond rates. Although this approach is required by the standard, some consider it to be inappropriate in such circumstances. This issue was debated by the Interpretations Committee, which published a draft interpretation on 8 July 2004 entitled D9 – *Employee Benefit Plans with a Promised Return on Contributions or Notional Contributions*. The approach taken in D9 was to distinguish two different types of benefits:

(a) a benefit of contributions or notional contributions plus a guarantee of a fixed return (in other words, benefits which can be estimated without having to make an estimate of future asset returns); and

(b) a benefit that depends on future asset returns.

For benefits under (a) above, it was proposed that the defined benefit methodology in IAS 19 be applied as normal. In summary, that meant:

- calculating the benefit to be paid in the future by projecting forward the contributions or notional contributions at the guaranteed fixed rate of return;
- allocating the benefit to periods of service;
- discounting the benefits allocated to the current and prior periods at the rate specified in IAS 19 to arrive at the plan liability, current service cost and net interest; and
- recognising any remeasurements in accordance with the entity's accounting policy (note that there is no longer an accounting policy choice under IAS 19 and remeasurements must be recorded in other comprehensive income).

For benefits covered by (b) above, it was proposed that the plan liability should be measured at the fair value, at the end of the reporting period, of the assets upon which the benefit is specified (whether plan assets or notional assets). No projection forward of the benefits would be made, and discounting of the benefit would not therefore be required.

D9 suggested that plans with a combination of a guaranteed fixed return and a benefit that depends on future asset returns should be accounted for by analysing the benefits into a fixed component and a variable component. The defined benefit asset or liability that would arise from the fixed component alone would be measured and recognised as described above. The defined benefit asset (or liability) that would arise from the variable component alone would then be calculated as described above and compared to the fixed component. An additional plan liability would be recognised to the extent that the asset (or liability) calculated for the variable component is smaller (or greater) than the asset (or liability) recognised in respect of the fixed component.

In August 2005, the Interpretations Committee however announced the withdrawal of D9, observing the following: 'The staff found the fixed/variable and modified fixed/variable approaches inadequate to give a faithful representation of the entity's obligation for more complex benefit structures. They believed that some aspects of the fixed/variable approach in D9 were not fully consistent with IAS 19. ... The staff ... recommended that the correct treatment for D9 plans should be determined as part of an IASB project.'

The Interpretations Committee was asked in 2012 whether the revisions to IAS 19 in 2011 affect the accounting for these types of employee benefits and concluded they do not.[2]

The Interpretations Committee re-opened its examination of the subject and spent some time considering the issue. In May 2014, it decided not to proceed with the issue, stating the following: 'In the Interpretations Committee's view, developing accounting requirements for these plans would be better addressed by a broader consideration of accounting for employee benefits, potentially through the research agenda of the IASB. The Interpretations Committee acknowledged that reducing diversity in practice in the short term would be beneficial. However, because of the difficulties encountered in progressing the issues, the Interpretations Committee decided to remove the project from its agenda. The Interpretations Committee notes the importance of this issue because of the increasing use of these plans. Consequently, the Interpretations Committee would welcome progress on the IASB's research project on post-employment benefits'.[3]

In February 2018 the Board announced a research project on pension benefits that depend on asset returns, see 16.1 below for further details.

3.6 Death-in-service benefits

The provision of death-in-service benefits is a common part of employment packages (either as part of a defined benefit plan or on a standalone basis). We think it is regrettable that IAS 19 provides no guidance on how to account for such benefits, particularly as E54 (the exposure draft preceding an earlier version of IAS 19) devoted considerable attention to the issue.[4] IAS 19 explains the removal of the guidance as follows: 'E54 proposed guidance on cases where death-in-service benefits are not insured externally and are not provided through a post-employment benefit plan. IASC concluded that such cases will be rare. Accordingly, IASC deleted the guidance on death-in-service benefits.' *[IAS 19.BC253]*.

In our view, this misses the point – E54 also gave guidance on cases where the benefits are externally insured and where they are provided through a post-employment benefit plan. In our view, the proposals in E54 had merit, and it is worth reproducing them here.

> 'An enterprise should recognise the cost of death-in-service benefits ... as follows:
>
> (a) in the case of benefits insured or re-insured with third parties, in the period in respect of which the related insurance premiums are payable; and
>
> (b) in the case of benefits not insured or re-insured with third parties, to the extent that deaths have occurred before the end of the reporting period.
>
> 'However, in the case of death-in-service benefits provided through a post-employment benefit plan, an enterprise should recognise the cost of those benefits by including their present value in the post-employment benefit obligation.
>
> 'If an enterprise re-insures a commitment to provide death-in-service benefits, it acquires a right (to receive payments if an employee dies in service) in exchange for an obligation to pay the premiums.
>
> 'Where an enterprise provides death-in-service benefits directly, rather than through a post-employment benefit plan, the enterprise has a future commitment to provide death-in-service coverage in exchange for employee service in those same future periods (in the same way that the enterprise has a future commitment to pay salaries if the employee renders service in those periods). That future commitment is not a present obligation and does not justify recognition of a liability. Therefore, an obligation arises only to the extent that a death has already occurred by the end of the reporting period.
>
> 'If death-in-service benefits are provided through a pension plan (or other post-employment plan) which also provides post-employment benefits to the same employee(s), the measurement of the obligation reflects both the probability of a reduction in future pension payments through death in service and the present value of the death-in-service benefits (see [E-54's discussion of mutual compatibility of actuarial assumptions]).
>
> 'Death-in-service benefits differ from post-employment life insurance because post-employment life insurance creates an obligation as the employee renders services in exchange for that benefit; an enterprise accounts for that obligation in accordance with [the requirements for defined benefit plans]. Life insurance benefits that are payable regardless of whether the employee remains in service comprise two components: a death-in-service benefit and a post-employment benefit. An enterprise accounts for the two components separately.'

We suggest that the above may continue to represent valid guidance to the extent it does not conflict with extant IFRS. In particular, an appropriate approach could be that:

- death-in-service benefits provided as part of a defined benefit post-employment plan are factored into the actuarial valuation. In this case any insurance cover should be accounted for in accordance with the normal rules of IAS 19 (see 6 below).

An important point here is that insurance policies for death-in-service benefits typically cover only one year, and hence will have a low or negligible fair value. As a result, it will not be the case that the insurance asset is equal and opposite to the defined benefit obligation;

- other death-in-service benefits which are externally insured are accounted for by expensing the premiums as they become payable; and
- other death-in-service benefits which are not externally insured are provided for as deaths in service occur.

The first bullet is particularly important. The measure of the post-employment benefit (like a pension) will be reduced to take account of expected deaths in service. Accordingly, it would be inappropriate to ignore the death in service payments that would be made. The question that arises is how exactly to include those expected payments. This raises the same issue as disability benefits (discussed at 13.2.2 below), i.e. what to do with the debit entry. However, IAS 19 has no explicit special treatment for death-in-service benefits comparable to that for disability benefits. Given the absence of specific guidance, the requirement is to apply the projected unit credit method to death in service benefits. As the benefit is fully vested, an argument could be made that the expected benefit should be accrued fully (on a discounted basis). Another approach would be to build up the credit entry in the statement of financial position over the period to the expected date of death.

An alternative approach could be to view death-in-service benefits as being similar to disability benefits. Proponents of this view would argue that the recognition requirements for disability benefits (discussed at 13.2.2 below) could also be applied to death-in-service.

In January 2008, the Interpretations Committee published its agenda decision explaining why it decided not to put death-in-service benefits onto its agenda.[5] In the view of the Interpretations Committee, 'divergence in this area was unlikely to be significant. In addition, any further guidance that it could issue would be application guidance on the use of the Projected Unit Credit Method'. In our view, the second reason seems more credible than the first.

As part of its analysis, the 'rejection notice' sets out some of the Interpretations Committee's views on the subject. It observes the following:

(a) in some situations, IAS 19 requires these benefits to be attributed to periods of service using the Projected Unit Credit Method;

(b) IAS 19 requires attribution of the cost of the benefits until the date when further service by the employee will lead to no material amount of further benefits under the plan, other than from further salary increases;

(c) the anticipated date of death would be the date at which no material amount of further benefit would arise from the plan; and

(d) using different mortality assumptions for a defined benefit pension plan and an associated death-in-service benefit would not comply with the requirement of IAS 19 to use actuarial assumptions that are mutually compatible.

Points (a) to (c) above support the analysis that a provision should be built up gradually from the commencement of employment to the expected date of death. They also suggest that making an analogy to the specific rules in the standard on disability may not be appropriate. In addition, point (c) is simply re-iterating a clear requirement of the standard. The above agenda decision of the Interpretations Committee is not as helpful as we would have liked. The use of the phrase 'in some situations' in point (a) above leaves uncertain just what those circumstances may be. In September 2007, the Interpretations Committee published a tentative agenda decision which said '[i]f these benefits are provided as part of a defined benefit plan, IAS 19 requires them to be attributed to periods of service using the Projected Unit Credit Method'.[6] At the following meeting the Interpretations Committee discussed the comment letters received which noted that it could be argued that such attribution would be required only if the benefits were dependent on the period of service. No decision was reached on the final wording of the rejection notice because 'IFRIC ... was unable to agree on wording for its agenda decision'.[7]

Given the lack of explicit guidance on death-in-service benefits in IAS 19 itself, and given the Interpretations Committee's decision not to address the matter, it seems likely that practice will be mixed.

4 DEFINED CONTRIBUTION PLANS

4.1 General accounting requirements

Accounting for defined contribution plans (see 3 above) is straightforward under IAS 19 because, as the standard observes, the reporting entity's obligation for each period is determined by the amounts to be contributed for that period. Consequently, no actuarial assumptions are required to be made to measure the obligation or the expense and there is no possibility of any actuarial gain or loss to the reporting entity. Moreover, the obligations are measured on an undiscounted basis, except where they are not expected to be settled wholly before twelve months after the end of the period in which the employees render the related service. *[IAS 19.50]*. Where discounting is required, the discount rate should be determined in the same way as for defined benefit plans, which is discussed at 7.6 below. *[IAS 19.52]*. In general, though, it would seem unlikely for a defined contribution scheme to be structured with such a long delay between the employee service and the employer contribution.

IAS 19 requires that, when an employee has rendered service during a period, the employer should recognise the contribution payable to a defined contribution plan in exchange for that service:

(a) as a liability (accrued expense), after deducting any contribution already paid. If the contribution already paid exceeds the contribution due for service before the end of the reporting period, the excess should be recognised as an asset (prepaid expense) to the extent that the prepayment will lead to, for example, a reduction in future payments or a cash refund; and

(b) as an expense, unless another IFRS requires or permits its capitalisation. *[IAS 19.51]*.

As discussed at 3.3.1.A above, IAS 19 requires multi-employer defined benefit plans to be accounted for as defined contribution plans in certain circumstances. The standard makes clear that contractual arrangements to make contributions to fund a deficit should be fully provided for (on a discounted basis) even if they are to be paid over an extended period. *[IAS 19.37]*.

4.2 Defined contribution plans with vesting conditions

In February 2011, the Interpretations Committee received a request seeking clarification on the effect that vesting conditions have on the accounting for defined contribution plans. The Interpretations Committee was asked whether contributions to such plans should be recognised as an expense in the period for which they are paid or over the vesting period. In the examples given in the submission, the employee's failure to meet a vesting condition could result in the refund of contributions to, or reductions in future contributions by, the employer.

The Interpretations Committee decided not to add the issue to its agenda, noting that there is no significant diversity in practice in respect of the effect that vesting conditions have on the accounting for defined contribution post-employment benefit plans, nor does it expect significant diversity in practice to emerge in the future.

Explaining its decision, the Interpretations Committee observed that 'each contribution to a defined contribution plan is to be recognised as an expense or recognised as a liability (accrued expense) over the period of service that obliges the employer to pay this contribution to the defined contribution plan. This period of service is distinguished from the period of service that entitles an employee to receive the benefit from the defined contribution plan (i.e. the vesting period), although both periods may be coincident in some circumstances. Refunds are recognised as an asset and as income when the entity/employer becomes entitled to the refunds, e.g. when the employee fails to meet the vesting condition'.[8]

5 DEFINED BENEFIT PLANS – GENERAL

The standard notes that accounting for defined benefit plans is complex because actuarial assumptions are required to measure both the obligation and the expense, and there is a possibility of actuarial gains and losses. Moreover, the obligations are measured on a discounted basis because they may be settled many years after the employees render the related service. *[IAS 19.55]*. Also, IAS 19 makes clear that it applies not just to unfunded obligations of employers but also to funded plans. The details of pension scheme arrangements vary widely from jurisdiction to jurisdiction and, indeed, within them. Frequently though, they involve some entity or fund, separate from the employer, to which contributions are made by the employer (and sometimes employees) and from which benefits are paid. Typically, the employer (through either legal or constructive obligations) essentially underwrites the fund in the event that the assets in the fund are insufficient to pay the required benefits. This is the key feature which means such an arrangement is a defined benefit plan (see 3 above). *[IAS 19.56]*.

In addition to specifying accounting and disclosure requirements, IAS 19 summarises the steps necessary to apply its rules, to be applied separately to each separate plan, as follows:

(a) determining the deficit or surplus by:
  (i) using an actuarial technique, the projected unit credit method, to make a reliable estimate of the ultimate cost to the entity of the benefit that employees have earned in return for their service in the current and prior periods. This requires an entity to determine how much benefit is attributable to the current and prior periods and to make estimates (actuarial assumptions) about demographic variables (such as employee turnover and mortality) and financial variables (such as future increases in salaries and medical costs) that will affect the cost of the benefit;
  (ii) discounting that benefit in order to determine the present value of the defined benefit obligation and the current service cost; and
  (iii) deducting the fair value of any plan assets from the present value of the defined benefit obligation.
(b) determining the amount of the net defined benefit liability (asset) as the amount of the deficit or surplus determined in (a), adjusted for any effect of limiting a net defined benefit asset to the asset ceiling;
(c) determining amounts to be recognised in profit or loss:
  (i) current service cost;
  (ii) any past service cost and gain or loss on settlement;
  (iii) net interest on the net defined benefit liability (asset); and
(d) determining the remeasurements of the net defined benefit liability (asset), to be recognised in other comprehensive income, comprising:
  (i) actuarial gains and losses;
  (ii) return on plan assets, excluding amounts included in net interest on the net defined benefit liability (asset); and
  (iii) any change in the effect of the asset ceiling, excluding amounts included in net interest on the net defined benefit liability (asset). *[IAS 19.57]*.

Retirement benefits will often be very significant in the context of an employer's financial statements. Therefore, the standard encourages, but does not require involvement of a qualified actuary in the measurement of all material post-employment benefit obligations. *[IAS 19.59]*. However, the standard acknowledges that in some circumstances estimates, averages and computational shortcuts may provide a reliable approximation. *[IAS 19.60]*. These steps are discussed in further detail in the sections 7.5 and 7.6 below.

6 DEFINED BENEFIT PLANS – PLAN ASSETS

6.1 Definition of plan assets

IAS 19 provides the following definitions relating to plan assets:

'*Plan assets* comprise:

(a) assets held by a long-term employee benefit fund; and
(b) qualifying insurance policies.' *[IAS 19.8]*.

‘Plan assets exclude unpaid contributions due from the reporting entity to the fund, as well as any non-transferable financial instruments issued by the entity and held by the fund. Plan assets are reduced by any liabilities of the fund that do not relate to employee benefits for example, trade and other payables and liabilities resulting from derivative financial instruments.’ *[IAS 19.114]*.

‘*Assets held by a long-term employee benefit fund* are assets (other than non-transferable financial instruments issued by the reporting entity) that:

(a) are held by an entity (a fund) that is legally separate from the reporting entity and exists solely to pay or fund employee benefits; and

(b) are available to be used only to pay or fund employee benefits, are not available to the reporting entity’s own creditors (even in bankruptcy), and cannot be returned to the reporting entity, unless either:

  (i) the remaining assets of the fund are sufficient to meet all the related employee benefit obligations of the plan or the reporting entity; or

  (ii) the assets are returned to the reporting entity to reimburse it for employee benefits already paid.’

Whilst non-transferable financial instruments issued by the employer are excluded from the definition of plan assets, plans can, and do, own transferrable instruments issued by the employer (such as listed shares and bonds) and these would qualify as plan assets.

‘A *qualifying insurance policy* is an insurance policy issued by an insurer that is not a related party (as defined in IAS 24 – *Related Party Disclosures* – see Chapter 39) of the reporting entity, if the proceeds of the policy:

(a) can be used only to pay or fund employee benefits under a defined benefit plan; and

(b) are not available to the reporting entity’s own creditors (even in bankruptcy) and cannot be paid to the reporting entity, unless either:

  (i) the proceeds represent surplus assets that are not needed for the policy to meet all the related employee benefit obligations; or

  (ii) the proceeds are returned to the reporting entity to reimburse it for employee benefits already paid.’ *[IAS 19.8]*.

A footnote to this definition clarifies that a qualifying insurance policy is not necessarily an insurance contract as defined in IFRS 4/IFRS 17 – *Insurance Contracts* – see Chapters 55 and 56.

IFRS 4 further mentions insurance contracts in the context of pensions. It discusses insurance policies issued by an insurer to a pension plan covering employees of the insurer or another entity consolidated in the same financial statements as the insurer. In such circumstances, IFRS 4 provides that the contract will generally be eliminated from the financial statements. The financial statements will:

- include the full amount of the pension obligation under IAS 19, with no deduction for the plan’s rights under the contract;
- not include a liability to policyholders under the contract; and
- include the assets backing the contract. *[IFRS 4.IG2 E 1.21]*.

The above has not been carried over into IFRS 17, although we would expect the same practice to continue under this standard.

6.2 Measurement of plan assets

IAS 19 requires plan assets to be measured at their fair value, *[IAS 19.113]*, which is defined as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. *[IAS 19.8]*. This is the same definition as is used in IFRS 13 – *Fair Value Measurement* (see Chapter 14).

The fair value of any plan assets is deducted from the present value of the defined benefit obligation in determining the deficit or surplus – see 8 below. *[IAS 19.113]*.

6.3 Qualifying insurance policies

Where plan assets include qualifying insurance policies that exactly match the amount and timing of some or all of the benefits payable under the plan, the fair value of those insurance policies is deemed to be the present value of the related obligations, subject to any reductions required if the amounts receivable under the insurance policies are not recoverable in full. *[IAS 19.115]*.

6.4 Reimbursement rights

Some employers may have in place arrangements to fund defined benefit obligations which do not meet the definition of qualifying insurance policies above but which do provide for another party to reimburse some or all of the expenditure required to settle a defined benefit obligation. In such a case, the expected receipts under the arrangement are not classified as plan assets under IAS 19 (and hence they are not presented as part of a net pension asset/liability – see 8 below). Instead, the employer should recognise its right to reimbursement as a separate asset, but only when it is virtually certain that another party will reimburse some or all of the expenditure required to settle a defined benefit obligation. The asset should be measured at fair value and, in all other respects, it should be treated in the same way as a plan asset. In particular, changes in fair value are disaggregated and accounted for in the same way as plan assets – see 10.3 below. In profit or loss, the expense relating to a defined benefit plan may be presented net of the amount recognised for a reimbursement. *[IAS 19.116-118]*.

As is the case for qualifying insurance policies, for reimbursement rights that exactly match the amount and timing of some or all of the benefits payable fair value is determined as the present value of the related obligation, subject to any reduction required if the reimbursement is not recoverable in full. *[IAS 19.119]*.

6.5 Contributions to defined benefit funds

Contributions to defined benefit plans under IAS 19 are a movement between line items in the statement of financial position – the reduction in cash for the employer being reflected by an increase in the plan assets. Perhaps because of this straightforward accounting, the standard provides no guidance on contributions, which it implicitly deals with as always being in the form of cash.

Although contributions are very commonly in cash, there is no reason why an employer could not contribute any other assets to a defined benefit plan and that raises the question of how to account for the disposal – particularly so, since from the point of transfer the assets will be measured at fair value under IAS 19. In our view, such a transfer of a non-cash asset should be treated as a disposal, with proceeds equal to the fair value of the asset. That would give rise to gains and losses in profit or loss (unless the asset in question was already carried at fair value) and, for certain assets (such as debt instruments held at fair value through other comprehensive income), the reclassification into profit or loss of amounts previously recognised in other comprehensive income.

6.6 Longevity swaps

A longevity swap transfers, from a pension scheme to an external party, the risk of members living longer (or shorter) than expected.

The Interpretations Committee was asked in August 2014 to clarify the measurement of longevity swaps held by an entity's defined benefit plan, and in particular discussed whether an entity should:

(a) account for a longevity swap as a single instrument and measure its fair value as part of plan assets (discussed at 6.2 above) with changes in fair value being recorded in other comprehensive income; or

(b) split longevity swaps into two components.

The two components in (b) would be a 'fixed leg' and a 'variable leg'. As the variable leg exactly matches some or all of the defined benefit obligation it would represent a qualifying insurance policy and be measured at the present value of the related obligation (discussed at 6.3 above). The fixed leg comprises a series of fixed payments to be made in return for the receipt of the variable leg receipts. In other words, a longevity swap could be considered to be economically equivalent to the purchase of qualifying insurance (commonly called a 'buy-in') but with the premium paid over a period of time rather than at inception.

The likely effect of disaggregating a longevity swap in this way would be to recognise a remeasurement loss at inception very similar to that for a buy-in. Conversely, considering the swap as a single instrument measured at fair value would likely have no initial effect as typically its fair value would be zero (that is, a premium neither received nor paid).

If the two legs were to be considered separately, an appropriate accounting policy would need to be applied to the fixed leg. Two possibilities were discussed by the Interpretations Committee as follows. The fixed leg would initially be measured at fair value with subsequent accounting either:

- if treated as part of plan assets, at fair value with interest reported in profit or loss and other changes being included in other comprehensive income (discussed at 6.2 above); or
- if treated as a financial liability at amortised cost using the effective interest rate method with interest recognised in profit and loss and no other remeasurements.

The Interpretations Committee noted that when such transactions take place, the predominant practice is to account for a longevity swap as a single instrument and measure it at fair value as part of plan assets.

The Interpretations Committee decided not to add this issue to its agenda as it did not expect diversity to develop in the application of IAS 19.[9] Given that the Interpretations Committee decided not to add this to its agenda we believe that either of the subsequent accounting options detailed above would be acceptable.

7 DEFINED BENEFIT PLANS – PLAN LIABILITIES

7.1 Legal and constructive obligations

IAS 19 refers to the liabilities of defined benefit plans as the present value of defined benefit obligations, which it defines as '... the present value, without deducting any plan assets, of expected future payments required to settle the obligation resulting from employee service in the current and prior periods'. *[IAS 19.8]*.

The obligations should include not only the benefits set out in the plan, but also any constructive obligations that arise from the employer's informal practices which go beyond the formal plan terms, and should where relevant include an estimate of expected future salary increases (taking into account inflation, seniority, promotion and other relevant factors, such as supply and demand in the employment market). *[IAS 19.61, 87-90]*.

A constructive obligation exists where a change in the employer's informal practices would cause unacceptable damage to its relationship with employees and which therefore leaves the employer with no realistic alternative but to pay those employee benefits. *[IAS 19.61]*. The term constructive obligation is not defined by IAS 19; however, as can be seen from the above it is very similar to the meaning of the term as used in IAS 37 where it is defined as follows:

'A constructive obligation is an obligation that derives from an entity's actions where:

(a) by an established pattern of past practice, published policies or a sufficiently specific current statement, the entity has indicated to other parties that it will accept certain responsibilities; and

(b) as a result, the entity has created a valid expectation on the part of those other parties that it will discharge those responsibilities.' *[IAS 37.10]*.

However, IAS 19 goes on to add a further nuance. The standard observes that it is usually difficult to cancel a retirement benefit plan (without payment) whilst still retaining staff, and in light of this it requires that reporting entities assume (in the absence of evidence to the contrary) any currently promised benefits will continue for the remaining working lives of employees. *[IAS 19.62]*. In our view, this is a somewhat lower hurdle, and could bring into the scope of defined benefit accounting promises which are (strictly) legally unenforceable and which would not necessarily be considered constructive obligations under IAS 37.

An employer's obligations (legal or constructive) may also extend to making changes to benefits in the future. The standard requires all such effects to be built into the computation of the obligation and gives the following examples of what they might comprise:

(a) the entity has a history of increasing benefits, for example, to mitigate the effects of inflation, and no indication that this practice will change in the future;

(b) the entity is obliged, either by the formal terms of the plan (or a further constructive obligation) or by legislation to use any surplus in the plan for the benefit of plan participants; or

(c) benefits vary in response to a performance target or other criteria. For example, the terms of the plan may state that it will pay reduced benefits or require additional contributions from employees if the plan assets are insufficient. The measurement of the obligation reflects the best estimate of the effect of target or other criteria. *[IAS 19.88]*.

By contrast, any other future changes in the obligation (i.e. where no legal or constructive obligation previously existed) will be reflected in future current service costs, future past service costs or both (discussed at 10.1 below). *[IAS 19.89]*.

IAS 19 also deals with the situation where the level of defined benefits payable by a scheme varies with the level of state benefits. When this is the case a best estimate of any changes in state benefit should be factored into the actuarial computations only if they are enacted by the end of the reporting period or are predictable based on past history or other evidence. *[IAS 19.87, 95]*.

Some defined benefit plans limit the contributions that an entity is required to pay. The ultimate cost of the benefits takes account of the effect of a limit on contributions. The effect of a limit on contributions is determined over the shorter of the estimated life of the entity and the estimated life of the plan. *[IAS 19.91]*.

7.2 Contributions by employees and third parties

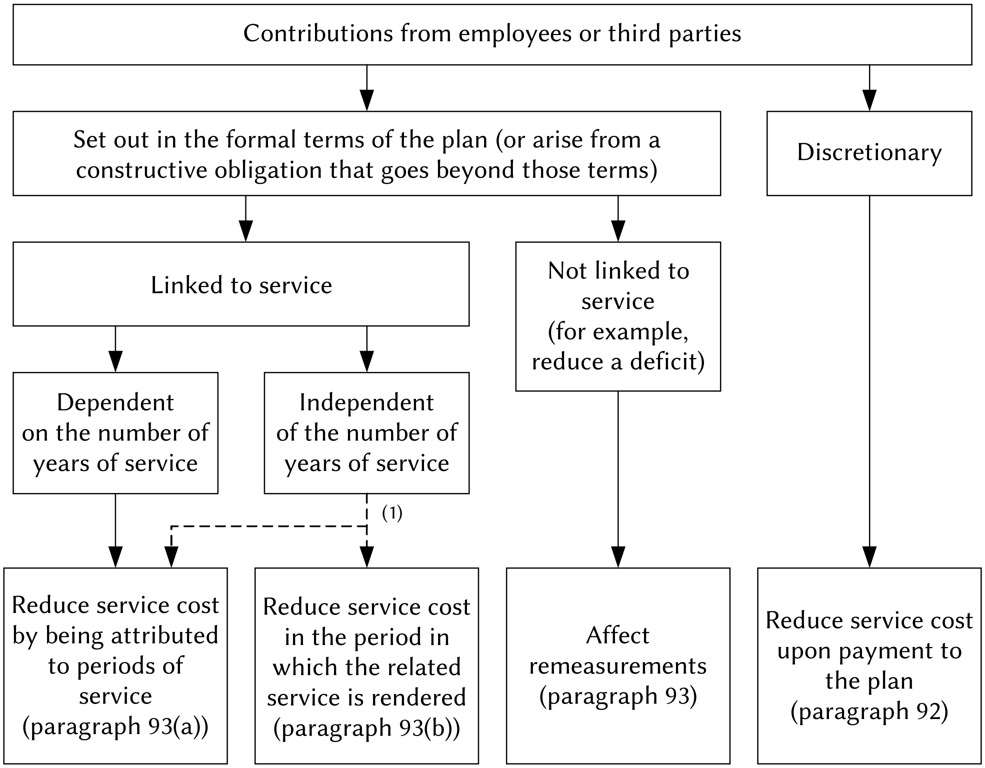
The standard notes that some defined benefit plans require employees or third parties to contribute to the cost of the plan. Contributions by employees reduce the cost of the benefits to the entity. The standard requires an entity to 'consider' whether third-party contributions reduce the cost of the benefits to the entity, or are a reimbursement right (discussed at 6.4 above). Contributions by employees or third parties are either set out in the formal terms of the plan (or arise from a constructive obligation that goes beyond those terms), or are discretionary. IAS 19 requires discretionary contributions by employees or third parties to be accounted for as a reduction in service cost when they are paid to the plan. *[IAS 19.92]*.

The standard draws a distinction between non-discretionary contributions from employees or third parties set out in the formal terms of the plan which are 'linked to service' and those which are not. Such contributions not dependent upon years of service reduce remeasurements of the net defined benefit liability (asset). An example given by the standard is if the contributions are required to reduce a deficit arising from losses on plan assets or actuarial losses. *[IAS 19.93]*.

For contributions which are linked to service, the standard states that they reduce the service cost as follows:

- if the amount of the contributions is dependent on the number of years of service (e.g. contributions that increase with years of service), they should be attributed to periods of service using the same attribution method required for the gross benefit (i.e. either using the plan's contribution formula or on a straight-line basis – see 7.3 below); or
- if the amount of the contributions is independent of the number of years of service (e.g. contributions that are a fixed percentage of salary), they are permitted to be recognised as a reduction of the service cost in the period in which the related service is rendered. Examples of contributions that are independent of the number of years of service include those that are a fixed percentage of the employee's salary, a fixed amount throughout the service period or dependent on the employee's age. *[IAS 19.93]*.

Application guidance is given in Appendix A to the standard in the form of the following flow chart.



Contributions from employees or third parties
Set out in the formal terms of the plan (or arise from a constructive obligation that goes beyond those terms)
Discretionary
Linked to service
Not linked to service (for example, reduce a deficit)
Dependent on the number of years of service
Independent of the number of years of service
(1)
Reduce service cost by being attributed to periods of service (paragraph 93(a))
Reduce service cost in the period in which the related service is rendered (paragraph 93(b))
Affect remeasurements (paragraph 93)
Reduce service cost upon payment to the plan (paragraph 92)

(1) This dotted arrow means that an entity is permitted to choose either accounting

Regrettably, the standard does not explain the 'mechanics' of an attribution which is required where contributions are linked to service.

In particular, it is unclear how to treat employee contributions made over the service period. As shown in Example 35.2 at 7.3 below, the projected unit credit method requires the net benefit to be expressed as a single net sum as at the date of retirement. Example 35.2 illustrates post-employment benefit payments being discounted to their present value as at the retirement date using the IAS 19 discount rate (discussed at 7.6 below). On the same principle, therefore, employee contributions made over the period of employment would logically need to be inflated to be expressed in the 'time value' as at retirement. However, IAS 19 does not indicate what rate should be used for this purpose.

We note, in this regard, that when the Interpretations Committee discussed the matter in November 2012, it considered a Staff Paper which touched on the matter. The numerical examples appended to the paper expressed the 'future value' of in-service employee contributions as at the date of retirement using the IAS 19 discount rate.[10] The content of the third example in this Staff Paper is reflected in the example set out below. This example pre-dates the amendments to IAS 19 in respect of employee contributions and therefore, we assume, that under the current standard that the entity has made an accounting policy choice to attribute contributions to periods of service, even though contributions are independent of the number of years of service.

Example 35.1: Defined benefit plan with employee contributions, where the discount rate is higher than the salary growth rate

A lump sum benefit is payable on termination of service and equal to 1 per cent of final salary for each year of service.

The salary in year 1 is CU10,000 and is assumed to increase at 7 per cent (compound) each year. The discount rate used is 10 per cent per year.

Employees are required to contribute 0.5% of salary each year, on the last day of the year.

Year	**1** **CU**	**2** **CU**	**3** **CU**	**4** **CU**	**5** **CU**	**Total**
Salary	10,000	10,700	11,449	12,250	13,108	
Benefit attributed to:						
– Prior years	–	131	262	393	524	
– Current year (1% of final salary) (a)	131	131	131	131	131	
	131	262	393	524	655

Cr Defined benefit obligation		50

The standard notes that changes in employee or third-party contributions dependent on number of years of service result in:

(a) current and past service cost if the changes are not set out in the formal terms of the plan and do not arise from a constructive obligation; or

(b) actuarial gains and losses if the changes in contributions are set out in the formal terms of the plan or arise from a constructive obligation. *[IAS 19.94]*.

7.3 Actuarial methodology

IAS 19 notes that the ultimate cost of a defined benefit plan may be influenced by many variables, such as final salaries, employee turnover and mortality, employee contributions and medical cost trends. The ultimate cost of the plan is uncertain and this uncertainty is likely to persist over a long period of time. In order to measure the present value of the post-employment benefit obligations and the related current service cost, it is necessary:

- to apply an actuarial valuation method;
- to attribute benefit to periods of service; and
- to make actuarial assumptions. *[IAS 19.66]*.

These steps are discussed in the following sections.

Plan obligations are to be measured using the projected unit credit method, *[IAS 19.67]*, (sometimes known as the accrued benefit method pro-rated on service or as the benefit/years of service method). This method sees each period of service as giving rise to an additional unit of benefit entitlement and measures each unit separately to build up the final obligation. *[IAS 19.68]*. This actuarial method also determines the current service cost and any past service cost. *[IAS 19.67]*. IAS 19 provides a simple example of what this entails as follows: *[IAS 19.68]*

Example 35.2: The projected unit credit method

A lump sum benefit is payable on termination of service and equal to 1% of final salary for each year of service. The salary in year 1 is 10,000 and is assumed to increase at 7% (compound) each year. The discount rate used is 10% per year. The following table shows how the obligation builds up for an employee who is expected to leave at the end of year 5, assuming that there are no changes in actuarial assumptions. For simplicity, this example ignores the additional adjustment needed to reflect the probability that the employee may leave the entity at an earlier or later date.

Year	*1*	*2*	*3*	*4*	*5*
Benefit attributed to:					
– prior years	–	131	262	393	524
– current year (1% of final salary)	131	131	131	131	131
– current and prior years	131	262	393	524	655
Opening obligation	–	89	196	324	476
Interest at 10%	–	9	20	33	48
Current service cost	89	98	108	119	131
Closing obligation	89	196	324	476	655

Note:

– The opening obligation is the present value of benefit attributed to prior years.

– The current service cost is the present value of benefit attributed to the current year.

– The closing obligation is the present value of benefit attributed to current and prior years.

As can be seen in this simple example, the projected unit credit method produces a figure for current service cost and interest cost (and, although not illustrated here, would where appropriate produce a figure for past service cost). These cost components are discussed at 10 below.

This example from the standard contains no underlying workings or proofs. The most useful would be as follows:

Final salary at year 5 (10,000 compounded at 7%)	$10{,}000 \times (1 + 0.07)^{4} = 13{,}100$
1% of final salary attributed to each year	131
Expected final benefit	5 years × 1% × 131,000 = 655
Current service cost, being present value of 131 discounted at 10%: e.g.	
Year 1	$131 \times (1 + 0.1)^{-4} = 89$
Year 2	$131 \times (1 + 0.1)^{-3} = 98$
Closing obligation, being years served multiplied by present value of 131: e.g.	
Year 3	3 years × $131 \times (1 + 0.1)^{-2} = 324$

7.4 Attributing benefit to years of service

The projected unit credit method requires benefits to be attributed to the current period (in order to determine current service cost) and the current and prior periods (in order to determine the present value of defined benefit obligations).

IAS 19 requires benefits to be attributed to the periods in which the obligation to provide post-employment benefits arises. That is when employees render services in return for post-employment benefits which an entity expects to pay in future reporting periods. The standard takes the view that actuarial techniques allow an entity to measure that obligation with sufficient reliability to justify recognition of a liability. *[IAS 19.71]*.

The standard also explains that employee service gives rise to an obligation under a defined benefit plan even if the benefits are conditional on future employment (in other words they are not vested). *[IAS 19.70]*. Employee service before the vesting date is considered to give rise to a constructive obligation because, at each successive period end, the amount of future service that an employee will have to render before becoming entitled to the benefit is reduced. In measuring its defined benefit obligation, an entity should consider the probability that some employees may not satisfy any vesting requirements. Similarly, although certain post-employment benefits, such as post-employment medical benefits, become payable only if a specified event occurs when an employee is no longer employed, an obligation is considered to be created when the employee renders service that will provide entitlement to the benefit if the specified event occurs. The probability that the specified event will occur affects the measurement of the obligation but does not determine whether for accounting purposes the obligation exists. *[IAS 19.72]*.

In applying the projected unit credit method, IAS 19 normally requires benefits to be attributed to periods of service under the plan's 'benefit formula'. For example, in some schemes the benefit vests over time as service is provided, regardless of continued service in future periods. In these arrangements, an employee has some benefit vested whenever employment ceases, even if payment is made at a later date. Accordingly, the attribution of those benefits to periods of service is a straightforward matter and will match the period of employment (i.e. attribution commences on the hire date and ceases on the date that the participant leaves employment).

If, however, an employee's service in later years will lead to a materially higher level of benefit, the benefit should be attributed on a straight-line basis from:

(a) the date when service by the employee first leads to benefits under the plan; until

(b) the date when further service by the employee will lead to no material amount of further benefits under the plan, other than from further salary increases. *[IAS 19.70].*

The requirements above apply the overarching principle of the standard, which is described as the 'objective' of IAS 19, i.e. that an entity recognises 'a liability when an employee has provided service in exchange for employee benefits to be paid in the future; and an expense when the entity consumes the economic benefits arising from service provided by an employee in exchange for employee benefits'.

As an example, some schemes have what some refer to as 'cliff vesting' where there is a requirement to be in employment at a certain age or on the occurrence of a certain future event in order for any entitlement to vest. For an arrangement like this it is necessary to determine the period over which the benefits should be recognised. The requirement to accrue benefits until 'further service by the employee will lead to no material amount of further benefits' effectively means that attribution should continue until the vesting date. Indeed, it would not be appropriate to have full provision for a benefit which has not yet vested – attribution must continue until the benefit has vested as this is the point at which 'further service by the employee will lead to no material amount of further benefits'.

The standard considers that this requirement is necessary because the employee's service throughout the entire period will ultimately lead to benefit at that higher level. *[IAS 19.73].*

Once the date until when benefits should be attributed is determined, the next step is to determine the point from which 'service by the employees first leads to benefits under the plan'.

This is a factual matter to be determined in light of all the facts and circumstances.

For example, a scheme may require the participant to be in service at a certain age and also to have rendered a certain number of years of service to the employer. In this situation, some judgement may be required in determining when the period of attribution begins. This is illustrated by example 6 below where the benefit vests at the age of 55 provided 20 years' service have also been provided. The start of attribution is determined, in this example, by counting back 20 years from the vesting date.

IAS 19 illustrates the attribution of benefits to service periods with a number of worked examples as follows: *[IAS 19.71-74]*

Example 35.3: Attributing benefits to years of service

1. *A defined benefit plan provides a lump-sum benefit of 100 payable on retirement for each year of service.*

   A benefit of 100 is attributed to each year. The current service cost is the present value of 100. The present value of the defined benefit obligation is the present value of 100, multiplied by the number of years of service up to the end of the reporting period.

   If the benefit is payable immediately when the employee leaves the entity, the current service cost and the present value of the defined benefit obligation reflect the date at which the employee is expected to leave. Thus, because of the effect of discounting, they are less than the amounts that would be determined if the employee left at the end of the reporting period.

2. *A plan provides a monthly pension of 0.2% of final salary for each year of service. The pension is payable from the age of 65.*

   Benefit equal to the present value, at the expected retirement date, of a monthly pension of 0.2% of the estimated final salary payable from the expected retirement date until the expected date of death is attributed to each year of service. The current service cost is the present value of that benefit for the current year of service. The present value of the defined benefit obligation is the present value of monthly pension payments of 0.2% of final salary, multiplied by the number of years of service up to the end of the reporting period. The current service cost and the present value of the defined benefit obligation are discounted because pension payments begin at the age of 65.

3. *A plan pays a benefit of 100 for each year of service. The benefits vest after ten years of service.*

   A benefit of 100 is attributed to each year. In each of the first ten years, the current service cost and the present value of the obligation reflect the probability that the employee may not complete ten years of service.

4. *A plan pays a benefit of 100 for each year of service, excluding service before the age of 25. The benefits vest immediately.*

   No benefit is attributed to service before the age of 25 because service before that date does not lead to benefits (conditional or unconditional). A benefit of 100 is attributed to each subsequent year.

5. *A plan pays a lump-sum benefit of 1,000 that vests after ten years of service. The plan provides no further benefit for subsequent service.*

   A benefit of 100 (1,000 divided by ten) is attributed to each of the first ten years. The current service cost in each of the first ten years reflects the probability that the employee may not complete ten years of service. No benefit is attributed to subsequent years.

6. *A plan pays a lump-sum retirement benefit of 2,000 to all employees who are still employed at the age of 55 after twenty years of service, or who are still employed at the age of 65, regardless of their length of service.*

   For employees who join before the age of 35, service first leads to benefits under the plan at the age of 35 (an employee could leave at the age of 30 and return at the age of 33, with no effect on the amount or timing of benefits). Those benefits are conditional on further service. Also, service beyond the age of 55 will lead to no material amount of further benefits. For these employees, the entity attributes benefit of 100 (2,000 divided by twenty) to each year from the age of 35 to the age of 55.

   For employees who join between the ages of 35 and 45, service beyond twenty years will lead to no material amount of further benefits. For these employees, the entity attributes benefit of 100 (2,000 divided by twenty) to each of the first twenty years.

   For an employee who joins at the age of 55, service beyond ten years will lead to no material amount of further benefits. For this employee, the entity attributes benefit of 200 (2,000 divided by ten) to each of the first ten years.

   For all employees, the current service cost and the present value of the obligation reflect the probability that the employee may not complete the necessary period of service.

7. *A post-employment medical plan reimburses 40% of an employee's post-employment medical costs if the employee leaves after more than ten and less than twenty years of service and 50% of those costs if the employee leaves after twenty or more years of service.*

   Under the plan's benefit formula, the entity attributes 4% of the present value of the expected medical costs (40% divided by ten) to each of the first ten years and 1% (10% divided by ten) to each of the second ten years. The current service cost in each year reflects the probability that the employee may not complete the necessary period of service to earn part or all of the benefits. For employees expected to leave within ten years, no benefit is attributed.

8. *A post-employment medical plan reimburses 10% of an employee's post-employment medical costs if the employee leaves after more than ten and less than twenty years of service and 50% of those costs if the employee leaves after twenty or more years of service.*

   Service in later years will lead to a materially higher level of benefit than in earlier years. Therefore, for employees expected to leave after twenty or more years, the entity attributes benefit on a straight-line basis (see 7.3 above). Service beyond twenty years will lead to no material amount of further benefits. Therefore, the benefit attributed to each of the first twenty years is 2.5% of the present value of the expected medical costs (50% divided by twenty).

   For employees expected to leave between ten and twenty years, the benefit attributed to each of the first ten years is 1% of the present value of the expected medical costs. For these employees, no benefit is attributed to service between the end of the tenth year and the estimated date of leaving.

   For employees expected to leave within ten years, no benefit is attributed.

9. *Employees are entitled to a benefit of 3% of final salary for each year of service before the age of 55.*

   Benefit of 3% of estimated final salary is attributed to each year up to the age of 55. This is the date when further service by the employee will lead to no material amount of further benefits under the plan. No benefit is attributed to service after that age.

The following points of note are brought out in the above:

- The scenarios in 3 and 5 are economically identical and are attributed to years of service accordingly. In each case benefits only vest after ten years, however an obligation is to be built up over that period rather than at the end;
- Example 6 above illustrates a plan with two potential vesting outcomes: the employee is either in employment at the age of 65; or he or she has provided 20 years of service at the age of 55 or thereafter. We note that the initial fact pattern in example 6 does not include 'or thereafter' but we have assumed this is part of the fact pattern from the solution given in the example. This example highlights that the start and end of the period of attribution may be different from the dates of employment. While the example explains that the start date cannot be before the age of 35 on the grounds that an employee could leave and re-join the company before 35 without having any impact on the benefits received, a more realistic explanation perhaps is that an employee who is hired before the age of 35 would have no additional benefits compared to an employee who only joins at 35, regardless of how many years the former has worked for the company before the age of 35. This effectively means that any period before the age of 35 does not increase the employees' benefits under the plan formula and therefore no benefit should be attributed to service before the age of 35.

  As far as the end of the attribution period is concerned, the response provided in example 6 for employees who join between the ages of 35 and 45 assumes a fact that is not described in the initial fact pattern, i.e. that the benefits are earned by all employees who have provided 20 years of services and are 55 or above. Absent that fact, benefits would have to be straight-lined from the hiring date until the age of 65 for all employees joining after the age of 35. This illustrates how important it is to consider all facts and circumstances to work out an appropriate accounting treatment.

- Example 8 illustrates that accruing a 10% benefit over a period of 20 years of service which jumps to 50% once 20 years have been completed is an example of service in later years leading to a materially higher level of benefit. Accordingly, the obligation is to be built-up on a straight-line basis over 20 years.
- As regards example 9, the standard explains that where the amount of a benefit is a constant proportion of final salary for each year of service, future salary increases will affect the amount required to settle the obligation that exists for service before the end of the reporting period, but do not create an additional obligation. Therefore:
  (a) for the purpose of allocating benefits to years of service, salary increases are not considered to lead to further benefits, even though the amount of the benefits is dependent on final salary; and
  (b) the amount of benefit attributed to each period should be a constant proportion of the salary to which the benefit is linked. *[IAS 19.74]*.

7.5 Actuarial assumptions

The long timescales and numerous uncertainties involved in estimating obligations for post-employment benefits require many assumptions to be made when applying the projected unit credit method. These are termed actuarial assumptions and comprise:

(a) demographic assumptions about the future characteristics of current and former employees (and their dependants) who are eligible for benefits and deal with matters such as:
  (i) mortality, both during and after employment;
  (ii) rates of employee turnover, disability and early retirement;
  (iii) the proportion of plan members with dependants who will be eligible for benefits;
  (iv) the proportion of plan members who will select each form of payment option under the plan terms, (for example, a plan may offer participants a choice between a lump-sum cash payment, annuities and instalments over a defined period and these alternatives may have a significantly different impact on the measurement of the defined benefit obligation; and
  (v) claim rates under medical plans; and
(b) financial assumptions, dealing with items such as:
  (i) the discount rate;
  (ii) future salary and benefit levels, excluding the cost of benefits that will be met by the employees;
  (iii) in the case of medical benefits, future medical costs, including claim handling costs, which the standard describes as costs that will be incurred in processing and resolving claims, including legal and adjuster's fees; and
  (iv) taxes payable by the plan on contributions relating to service before the reporting date or on benefits resulting from that service. *[IAS 19.76]*.

The requirements of IAS 19 in this regard are set out below, with the exception of the discount rate which is discussed at 7.6 below.

The standard requires that actuarial assumptions be unbiased (that is, neither imprudent nor excessively conservative), mutually compatible and represent the employer's best estimates of the variables that will determine the ultimate cost of providing post-employment benefits. *[IAS 19.75-77]*. Actuarial assumptions are mutually compatible if they reflect the economic relationships between factors such as inflation, rates of salary increase and discount rates. For example, all assumptions which depend on a particular inflation level (such as assumptions about interest rates and salary and benefit increases) in any given future period should assume the same inflation level in that period. *[IAS 19.78]*.

The financial assumptions must be based on market expectations at the end of the reporting period, for the period over which the obligations are to be settled. *[IAS 19.80]*.

The standard requires that a defined benefit obligation be measured on a basis that reflects:

(a) the benefits set out in the terms of the plan (or resulting from any constructive obligation that goes beyond those terms) at the end of the reporting period;

(b) any estimated future salary increases that affect the benefits payable;

(c) the effect of any limit on the employer's share of the cost of the future benefits; and

(d) contributions from employees or third parties that reduce the ultimate cost to the entity of those benefits. *[IAS 19.87]*.

Regarding mortality, the standard requires assumptions to be a best estimate of the mortality of plan members both during and after employment. *[IAS 19.81]*. In particular, expected changes in mortality should be considered, for example by modifying standard mortality tables with estimates of mortality improvements. *[IAS 19.82]*.

Assumptions about medical costs should take account of inflation as well as specific changes in medical costs (including technological advances, changes in health care utilisation or delivery patterns, and changes in the health status of plan participants). *[IAS 19.96-97]*. The standard provides a quite detailed discussion of the factors that should be taken into account in making actuarial assumptions about medical costs, in particular:

(a) measuring post-employment medical benefits requires assumptions about the level and frequency of future claims, and the cost of meeting them. An employer should make such estimates based on its own experience, supplemented where necessary by historical data from other sources (such as other entities, insurance companies and medical providers); *[IAS 19.97]*

(b) the level and frequency of claims is particularly sensitive to the age, health status and sex of the claimants, and may also be sensitive to their geographical location. This means that any historical data used for estimating future claims need to be adjusted to the extent that the demographic mix of the plan participants differs from that of the population used as the basis for the historical data. Historical data should also be adjusted if there is reliable evidence that historical trends will not continue; *[IAS 19.98]* and

(c) estimates of future medical costs should take account of any contributions that claimants are required to make based on the terms (whether formal or constructive) of the plan at the end of the reporting period. The treatment of contributions by employees and third parties is discussed at 7.2 above.

Clearly, the application of actuarial techniques to compute plan obligations is a complex task, and it seems likely that few entities would seek to prepare valuations without the advice of qualified actuaries. However, IAS 19 only encourages, but does not require that an entity take actuarial advice. *[IAS 19.59]*.

However sophisticated actuarial projections may be, reality will (apart from the most simple scenarios) always diverge from assumptions. This means that when a surplus or deficit is estimated, it will almost certainly be different from the predicted value based on the last valuation. These differences are termed actuarial gains and losses. The standard observes that actuarial gains and losses result from increases or decreases in the present value of a defined benefit obligation because of changes in actuarial assumptions and experience adjustments (see 10.4.1 below). Causes of actuarial gains and losses could include, for example:

(a) unexpectedly high or low rates of employee turnover, early retirement or mortality or of increases in salaries, benefits (if the formal or constructive terms of a plan provide for inflationary benefit increases) or medical costs;

(b) differences between the actual return on plan assets and amounts included as part of net interest in profit or loss;

(c) the effect of changes to assumptions concerning benefit payment options. Often an important example of this is the choice between an annuity and a lump sum payment as the various options are generally not actuarially equivalent (e.g. a lump sum payment will generally be less costly for the entity);

(d) the effect of changes in estimates of future employee turnover, early retirement or mortality or of increases in salaries, benefits (if the formal or constructive terms of a plan provide for inflationary benefit increases) or medical costs; and

(e) the effect of changes in the discount rate. *[IAS 19.128, 111]*.

Actuarial gains and losses are discussed further at 10.4.1 below.

7.6 Discount rate

Due to the long timescales involved, post-employment benefit obligations are discounted. The whole obligation should be discounted, even if part of it is expected to be settled within twelve months of the end of the reporting period. *[IAS 19.69]*. The standard requires that the discount rate reflect the time value of money but not the actuarial or investment risk. Furthermore, the discount rate should not reflect the entity-specific credit risk borne by the entity's creditors, nor should it reflect the risk that future experience may differ from actuarial assumptions. *[IAS 19.84]*. The discount rate should reflect the estimated timing of benefit payments. For example, an appropriate rate may be quite different for a payment due in, say, ten years as opposed to one due in twenty. The standard observes that in practice, an acceptable answer can be obtained by applying a single weighted average discount rate that reflects the estimated timing and amount of benefit payments and the currency in which the benefits are to be paid. *[IAS 19.85]*. The standard does not preclude the use of a more granular approach in discounting cash flows at different periods along the yield curve. Nor does it preclude the use of different discount rates for different classes of participant in the interest of achieving a more precise measure of the defined benefit obligation than the computational shortcut which is allowed by the standard. An example of where discount rates may vary by class or participant is where there are both active and pensioner members, discount rates will vary by each of these classes purely as a result of their ages and the resultant timing of outflows associated to these classes. Whether it is acceptable to use the weighted average discount rate or a more granular approach is an entity's judgement which should be applied consistently. However, we would not expect an entity that elects to use the granular approach premised on it being a more precise measure to move back to the weighted average approach in subsequent periods.

The standard requires that actuarial assumptions, including discount rates be unbiased. *[IAS 19.83]*. A subpopulation of high quality corporate bonds (see 7.6.1 below) used to derive a discount rate would only result in an unbiased assumption if the selection from the population of bonds was not skewed. For example, the exclusion of bonds from a population outside two standard deviations of the mean (both at the higher end and the lower end) would not result in an unbiased selection of the discount rate. However, if the entity were to exclude say bonds with the lowest 40% and the highest 10% yields, or bonds with a yield below the median, these methods would produce biased results.

IAS 19 also stipulates that the discount rate (and other financial assumptions) should be determined in nominal (stated) terms, unless estimates in real (inflation-adjusted) terms are more reliable, for example, in a hyper-inflationary economy (see Chapter 16 for a discussion of IAS 29 – *Financial Reporting in Hyperinflationary Economies*), or where the benefit is index-linked and there is a deep market in index-linked bonds of the same currency and term. *[IAS 19.79]*.

The basic part of this requirement – that a nominal rate be used – is consistent with the definition of the present value of a defined benefit obligation in that it should be ' ... the present value ... of expected future payments required to settle the obligation ...' (see 7.1 above). In other words, as the future cash flows are stated at the actual amounts expected to be paid, the rate used to discount them should reflect that and not be adjusted to remove the effects of expected inflation. In contrast, the reference to the use of index-linked bonds seems to allow taking account of inflation through the discount rate (which would require expressing cash flows in current prices). This approach seems to be in conflict with the definition of the obligation. However, in practice few index-linked corporate bonds exist (so it may be quite rare to have a deep market in them) and a more reliable approach may often be to take account of inflation via the projected cash flows.

The Interpretations Committee in July 2013 discussed whether the rate should be pre- or post-tax. It observed that the discount rate used to calculate a defined benefit obligation should be a pre-tax discount rate and decided not to add this issue to its agenda.[11]

Negative interest rates have been experienced in the past and at the time it was believed that these would be a temporary phenomenon, restricted to relatively short-term rates for certain government debt and deposits. This phenomenon has, however, not been short-lived with negative yields on government bonds seen in several countries and in some high quality corporate bonds. Discount rates are applied in various IFRS standards. In the context of IAS 19 specifically, the standard does not contain a zero percent floor and negative discount rates should be used.

7.6.1 High quality corporate bonds

The rate used should be determined 'by reference to' the yield (at the end of the reporting period) on high quality corporate bonds of currency and term consistent with the liabilities. For currencies in which there is no deep market in such bonds, the yields on government bonds should be used instead (see 7.6.2 below). *[IAS 19.83]*.

IAS 19 does not explain what is meant by the term 'high quality'. In practice it is considered, rightly in our view, to mean either: bonds rated AA, bonds rated AA or higher by Standard and Poor's, or an equivalent rating from another rating agency.

The requirement that the rate be determined 'by reference to' high quality bond rates is an important one.

The standard gives an example of this in the context of the availability of bonds with sufficiently long maturities. It notes that in some cases, there may be no deep market in bonds with a sufficiently long maturity to match the estimated maturity of all the benefit payments. In such cases, the standard requires the use of current market rates of the appropriate term to discount shorter-term payments, and estimation of the rate for longer maturities by extrapolating current market rates along the yield curve. In practice extrapolation is appropriate when longer maturities result in too few observable bonds for the rates derived from these to be meaningful. It goes on to observe that the total present value of a defined benefit obligation is unlikely to be particularly sensitive to the discount rate applied to the portion of benefits that is payable beyond the final maturity of the available corporate or government bonds. *[IAS 19.86]*.

In November 2013, the Interpretations Committee was asked whether corporate bonds with a rating lower than 'AA' can be considered to be 'high quality corporate bonds' ('HQCB').

The Interpretations Committee decided not to add the item to its agenda as issuing additional guidance or changing the requirements would be too broad for it to achieve in an efficient manner. The Interpretations Committee recommended that the IASB should address the issue as part of its research project on discount rates.[12] The Interpretations Committee reported this conclusion to the IASB at its December 2013 meeting. The IASB noted that no further work is currently planned on the issue of determining the discount rate for post-employment benefit obligations.[13]

The key observations of the Interpretations Committee were as follows.

- IAS 19 does not specify how to determine the market yields on HQCB, and in particular what grade of bonds should be designated as high quality;
- that 'high quality' as used in IAS 19 reflects an absolute concept of credit quality and not a concept of credit quality that is relative to a given population of corporate bonds, which would be the case, for example, if the paragraph used the term 'the highest quality'. Consequently, the concept of high quality should not change over time. Accordingly, a reduction in the number of HQCB should not result in a change to the concept of high quality. The Committee does not expect that an entity's methods and techniques used for determining the discount rate so as to reflect the yields on HQCB will change significantly from period to period;

- IAS 19 already contains requirements if the market in HQCB is no longer deep or if the market remains deep overall, but there is an insufficient number of HQCB beyond a certain maturity; and
- typically, the discount rate will be a significant actuarial assumption to be disclosed with sensitivity analyses under IAS 19.

As required by IAS 1 (see Chapter 3 at 5.1.1.B), disclosure is required of the judgements that management has made in the process of applying the entity's accounting policies and that have the most significant effect on the amounts recognised in the financial statements. Typically, the identification of the HQCB population used as a basis to determine the discount rate requires the use of judgement, which may often have a significant effect on the entity's financial statements.

In some countries ratings agencies may provide both a local rating and a global rating. As noted above the concept of 'high quality' is an absolute notion and therefore global ratings should be used to determine whether high quality corporate bonds exist in a currency.

7.6.2 No deep market

In currencies where there is no deep market in high quality corporate bonds, the market yields (at the end of the reporting period) on government bonds shall be used. *[IAS 19.83]*. This paragraph was amended by the Annual Improvements 2012-2014 Cycle replacing the reference to countries with a reference to currencies where there is no deep market in high quality corporate bonds. This amendment was issued to clarify, in particular, that for IAS 19 purposes the euro zone is considered in its entirety.

In June 2017, the Interpretations Committee considered a question on how an entity determines the rate to be used to discount post-employment benefit obligations in a country (in this case Ecuador) which has adopted another currency as its official or legal currency (in this case the US dollar). The entity's post-employment benefit obligation is denominated in US dollars. The submitter also confirmed that there was no deep market for high quality bonds denominated in US dollars in the country in which it operates (Ecuador).

The question asked by the submitter was whether in this situation the entity should consider the depth of the market in high quality corporate bonds denominated in US dollars in other markets or countries in which those bonds are issued. They also asked whether the entity can use market yields on bonds denominated in US dollars issued by the Ecuadorian government, or whether it is required to use market yields on bonds denominated in US dollars issued by a government in another market or country.

The Committee observed that applying paragraph 83 of IAS 19 (see 7.6.1 above) requires that:

- an entity with post-employment benefit obligations denominated in a particular currency assesses the depth of the market in high quality corporate bonds denominated in that currency, and does not limit this assessment to the market of country in which it operates;
- if there is a deep market in high quality corporate bonds denominated in that currency, the discount rate is determined by reference to market yields on high quality corporate bonds at the end of the reporting period;

- if there is no deep market in high quality corporate bonds in that currency, the entity determines the discount rate using market yields on government bonds denominated in that currency; and
- the entity applies judgement to determine the appropriate population of high quality corporate bonds or government bonds to reference when determining the discount rate. The currency and term of the bonds should be consistent with the currency and estimated term of the post-employment benefit obligations.

The Committee noted that the discount rate does not reflect the expected return on plan assets; the Basis of Conclusions IAS 19 confirms that the measurement of the obligation should be independent of the measurement of any plan assets held by the plan. *[IAS 19.BC130]*.

The Committee also considered the interaction between the matters discussed above and the requirement that actuarial assumptions be mutually compatible (see 7.5 above). *[IAS 19.75]*. The Committee concluded that it is not possible to assess whether, and to what extent, a discount rate derived by applying the specific requirements of IAS 19 is compatible with other actuarial assumptions and that the specific requirements of IAS 19 should be applied when determining the discount rate.

The overall conclusion of the Committee was that the requirements in IAS 19 provide an adequate basis for the determination of a discount rate in the circumstances described above. Consequently, the Committee decided not to add this matter to its agenda.

7.7 Frequency of valuations

When it addresses the frequency of valuations, IAS 19 does not give particularly prescriptive guidance. Rather, its starting point is simply to require that the present value of defined benefit obligations, and the fair value of plan assets, should be determined frequently enough to ensure that the amounts recognised in the financial statements do not differ materially from the amounts that would be determined at the end of the reporting period. *[IAS 19.58]*. An argument could be launched that, without a full valuation as at the end of the reporting period to compare with, it cannot be possible to know whether any less precise approach is materially different. However, it is reasonably clear that the intention of the standard is not necessarily to require full actuarial updates as at the reporting date. This is because the standard goes on to observe that for practical reasons a detailed valuation may be carried out before the end of the reporting period and that if such amounts determined before the end of the reporting period are used, they should be updated to take account of any material transactions or changes in circumstances up to the end of the reporting period. *[IAS 19.59]*. Much may depend on what is considered to be a 'material change', however it is expressly to include changes in market prices (hence requiring asset values to be those at the end of the reporting period) and interest rates, as well as financial actuarial assumptions. *[IAS 19.59, 80]*.

In this regard, it is also worth noting the observation in the standard that '[i]n some cases, estimates, averages and computational shortcuts may provide a reliable approximation of the detailed computations illustrated in this Standard'. *[IAS 19.60]*. It should be remembered, though, that it is the amounts in the financial statements which must not differ materially from what they would be based on a valuation at the end of the reporting period. For funded schemes, the net surplus or deficit is usually the difference between two very large figures – plan assets and plan liabilities. Such a net item is inevitably highly sensitive, in percentage terms, to a given percentage change in the gross amounts.

In summary, a detailed valuation will be required on an annual basis, but not necessarily as at the end of the reporting period. However, a valuation undertaken other than as at the end of the reporting period will need to be updated as at the end of the reporting period to reflect at least changes in observable market data, such as asset values and discount rates. The need for updates in respect of other elements of the valuation will depend on individual circumstances.

8 DEFINED BENEFIT PLANS – TREATMENT OF THE PLAN SURPLUS OR DEFICIT IN THE STATEMENT OF FINANCIAL POSITION

8.1 Net defined benefit liability (asset)

IAS 19 defines the net defined benefit liability or asset as the deficit or surplus in the plan adjusted for any effect of the asset ceiling (see 8.2 below).

The deficit or surplus is the present value of the defined benefit obligation (see 7 above) less the fair value of the plan assets (if any) (see 6 above).

The standard requires that the net defined benefit liability (asset) be recognised in the statement of financial position at each reporting period. *[IAS 19.63]*.

8.2 Restriction of assets to their recoverable amounts

The net defined benefit balance determined under IAS 19 may be an asset. The standard asserts that an asset may arise (that is, an asset measured on the basis of IAS 19) where a defined benefit plan has been 'over-funded' or when actuarial gains have arisen. The standard justifies the recognition of an asset in such cases because:

(a) the entity controls a resource, which is the ability to use the surplus to generate future benefits;

(b) that control is a result of past events (contributions paid by the entity and service rendered by the employee); and

(c) future economic benefits are available to the entity in the form of a reduction in future contributions or a cash refund, either directly to the entity or indirectly to another plan in deficit; the present value of those benefits is described as the asset ceiling. *[IAS 19.8, 65]*.

In practice, pension plans tend to be funded on a significantly more prudent basis than would be the case if a surplus or deficit was measured in accordance with IAS 19. In particular, the discount rate used for funding purposes is typically lower than the rate required by the standard. For this reason, an IAS 19 valuation may produce a surplus, when for funding purposes there is a deficit.

When there is a surplus in a defined benefit plan, the standard requires the net asset recognised to be restricted to the lower of the surplus in the plan and the asset ceiling discounted using the same discount rate used for determining the defined benefit obligation (see 7.6 above). *[IAS 19.8, 64, IFRIC 14.1]*.

Any adjustment required by the ceiling test is accounted for in other comprehensive income (see 10.4 below).

This limitation has proved quite problematic in practice and as a result was considered by the Interpretations Committee, initially in the context of statutory minimum funding requirements ('MFR'). This resulted in the publication, in July 2007, of IFRIC 14 – *IAS 19 – The Limit on a Defined Benefit Asset, Minimum Funding Requirements and their Interaction.* Whilst dealing with the interaction of the asset ceiling with MFR, IFRIC 14 also deals more generally with the restriction of an asset on recoverability grounds. *[IFRIC 14.1-3, 6]*. Subsequently, IFRIC 14 was amended to deal with pre-paid MFR – see 8.2.3 below. It should also be noted that the IASB has published an exposure draft of proposed amendments to IAS 19 and IFRIC 14 which addresses whether other parties' (for example pension trustees) power to enhance benefits for plan members or wind up a plan affects the availability of a refund (see 16.2.1 below). There is no current date for the finalisation of amendments to the interpretation and, at the date of writing, the current status of the project is described as follows: 'The Board decided not to finalise the proposed amendments to IFRIC 14. The Board will consider the project's direction at a future meeting. More specifically, the Board will consider whether to develop new proposals to address the matter.'

The Interpretations Committee notes that MFR exist in many countries and normally stipulate a minimum amount or level of contribution that must be made to a plan over a given period. Therefore, a minimum funding requirement may limit an entity's ability to reduce future contributions. *[IFRIC 14.2]*.

In addition, the limit on the measurement of a defined benefit asset may cause a minimum funding requirement to be onerous. Normally, a requirement to make contributions to a plan would not affect the measurement of the defined benefit asset or liability. This is because the contributions, once paid, will become plan assets and so the additional net liability is nil. However, a minimum funding requirement may give rise to a liability if the required contributions will not be available to the entity once they have been paid. *[IFRIC 14.3]*.

The issues addressed by IFRIC 14 are: *[IFRIC 14.6]*

- when refunds or reductions in future contributions should be regarded as available in accordance with the definition of the asset ceiling (discussed at 8.2.1 and 8.2.2 below);
- how a minimum funding requirement might affect the availability of reductions in future contributions (discussed at 8.2.3 below); and
- when a minimum funding requirement might give rise to a liability (discussed at 8.2.4 below).

8.2.1 IFRIC Interpretation 14 – general requirements concerning the limit on a defined benefit asset

IFRIC 14 clarifies that economic benefits, in the form of refunds or reduced future contributions, are available if they can be realised by the entity at some point during the life of the plan or when the plan liabilities are settled. In particular, such economic benefits may be available even if they are not realisable immediately at the end of the reporting period. *[IFRIC 14.8]*.

Furthermore, the benefit available does not depend on how the entity intends to use the surplus. The entity should determine the maximum economic benefit that is available from refunds, reductions in future contributions or a combination of both. However, economic benefits should not be recognised from a combination of refunds and reductions in future contributions based on assumptions that are mutually exclusive. *[IFRIC 14.9]*. Perhaps unnecessarily, the interpretation requires the availability of a refund or a reduction in future contributions to be determined in accordance with the terms and conditions of the plan and any statutory requirements in the jurisdiction of the plan. *[IFRIC 14.7]*.

The interpretation observes that an unconditional right to a refund can exist whatever the funding level of a plan at the end of the reporting period. The interpretation further states that benefits are available as a refund only if the entity has an unconditional right to a refund:

(a) during the life of the plan, without assuming that the plan liabilities must be settled in order to obtain the refund; or

(b) assuming the gradual settlement of the plan liabilities over time until all members have left the plan; or

(c) assuming the full settlement of the plan liabilities in a single event (i.e. as a plan wind-up).

However, if the right to a refund of a surplus depends on the occurrence or non-occurrence of one or more uncertain future events not wholly within an entity's control, the entity does not have an unconditional right and should not recognise an asset. *[IFRIC 14.11-12]*.

The economic benefit available as a refund should be measured as the amount of the surplus at the end of the reporting period (being the fair value of the plan assets less the present value of the defined benefit obligation) that the entity has a right to receive as a refund, less any associated costs. For example, if a refund would be subject to a tax other than income tax of the reporting entity, it should be measured net of the tax. *[IFRIC 14.13]*. Tax on defined benefit pension plans is discussed further in Chapter 33 at 10.7.

In measuring the amount of a refund available when the plan is wound up (point (c) above), the costs to the plan of settling the plan liabilities and making the refund should be included. For example, a deduction should be made for professional fees if these are paid by the plan rather than the entity, and the costs of any insurance premiums that may be required to secure the liability on wind-up. *[IFRIC 14.14]*.

It is usually the case that the trustees of a pension fund are independent of the entity. Trustees may have a variety of powers to influence a surplus in a plan. For example:

- setting the investment strategy whereby assets with lower risk and lower return would erode a surplus over time; or the purchase of assets in the form of insurance policies matching all or some of the cash outflows of the plan; or
- full or partial settlement of liabilities; or the improvement of benefits under the plan.

IFRIC 14 makes it clear that for future benefit improvements made by the employer and actuarial gains and losses, the existence of an asset at the end of the reporting period is not affected by possible future changes to the amount of the surplus. If future events occur that change the amount of the surplus, their effects are recognised when they occur. *[IFRIC 14.BC10]*.

The interpretation is also clear that if the right to a refund of a surplus depends on the occurrence or non-occurrence of one or more uncertain future events that are not wholly within an entity's control, the entity does not have an unconditional right and should not recognise a surplus. *[IFRIC 14.11-12]*.

However, neither IAS 19 nor IFRIC 14 address the question of whether the entity's right to a refund of a surplus which depends on the occurrence or non-occurrence of uncertain future events means that no surplus should be recognised in any scenario where trustees have the power to 'spend' a surplus.

As noted above, the IASB has published an exposure draft of proposed amendments to IFRIC 14 which addresses whether the power of other parties (for example pension trustees) to enhance benefits for plan members or wind up a plan affects the availability of a refund (see 16.2.1 below). This exposure draft was issued as a response to two requests to the Interpretations Committee, suggesting that there is diversity in practice in this area. In the Basis for Conclusions on the exposure draft the IASB noted that paragraph BC10 of IFRIC 14 had not specifically addressed the circumstances in which trustees have such unconditional powers. The exposure draft proposes that the amount of the surplus that the entity recognises as an asset on the basis of a future refund shall not include amounts that other parties can use for other purposes that affect the benefits for plan members, for example by enhancing those benefits without the entity's consent. Until the issue is clarified through the amendment to the standard and interpretation we expect diversity in practice to continue in this area.

If the amount of a refund is determined as the full amount or a proportion of the surplus, rather than a fixed amount, an entity should make no adjustment for the time value of money, even if the refund is realisable only at a future date. *[IFRIC 14.15]*.

8.2.2 Economic benefits available as reduced future contributions when there are no minimum funding requirements for future service

IFRIC 14 addresses separately cases where there are minimum funding requirements relating to benefits to be awarded in future periods in exchange for services to be rendered in those periods, and cases where there are no such funding requirements.

This section deals with the situation where there are no such funding requirements. The implications of future service minimum funding requirements are discussed at 8.2.3 below.

IFRIC 14 requires that the economic benefit available by way of reduced future contributions be determined as the future service cost to the entity for each period over the shorter of the expected life of the plan and the expected life of the entity. The future service cost to the entity excludes amounts that will be borne by employees. *[IFRIC 14.16]*.

Future service costs should be determined using assumptions consistent with those used to determine the defined benefit obligation and with the situation that exists at the end of the reporting period as determined by IAS 19. Accordingly, no future changes to the benefits to be provided by a plan should be assumed until the plan is amended, and a stable workforce in the future should be assumed unless the entity makes a reduction in the number of employees covered by the plan. In the latter case, the assumption about the future workforce should include the reduction. The present value of the future service cost should be determined using the same discount rate as that used in the calculation of the defined benefit obligation (discount rates are discussed at 7.6 above). *[IFRIC 14.17]*.

8.2.3 IFRIC Interpretation 14 – the effect of a minimum funding requirement on the economic benefit available as a reduction in future contributions

IFRIC 14 defines minimum funding requirements as 'any requirements to fund a post-employment or other long-term defined benefit plan'. *[IFRIC 14.5]*. This is clearly quite a wide definition encompassing more than just statutory regimes.

Some minimum funding arrangements require periodic reappraisal (for example, every three years). Should such an arrangement cover a longer period, all payments over this longer period constitute the minimum funding requirement, not just the three years until the next reappraisal. In its March 2015 meeting the Interpretations Committee, following a request for clarification, discussed whether an entity should assume that the minimum funding requirement for contributions to cover future services (see below) would continue over the estimated life of the pension plan. In its July 2015 meeting, the Interpretations Committee noted that the entity should assume a continuation of existing funding principles because:[14]

- For any factors not specified by the minimum funding basis (for example, the period to continue the plan is not specified by the existing funding principles), the assumptions for determining future service costs and those used to estimate the future minimum funding requirement contributions for future service must be consistent. This is because the Interpretation requires an entity to use assumptions that are consistent with those used to determine the defined benefit obligation and with the situation that exists at the end of the reporting period. *[IFRIC 14.17, 21]*.
- The estimate should not include changes to the funding principles to determine contributions for future service, if such changes require future negotiations with pension trustees. *[IFRIC 14.21, BC30]*.

The interpretation requires any minimum funding requirement at a given date to be analysed into contributions that are required to cover: *[IFRIC 14.18]*

(a) any existing shortfall for past service on the minimum funding basis. These contributions do not affect future contributions for future service. However, they may give rise to a liability under IFRIC 14 (see 8.2.4 below); *[IFRIC 14.19]* and

(b) future service.

If there is a minimum funding requirement for contributions relating to future service, the economic benefit available as a reduction in future contributions is the sum of: *[IFRIC 14.20]*

(a) any amount that reduces future minimum funding requirement contributions for future service because the entity made a pre-payment (that is, it paid the amount before being required to do so); and

(b) the estimated future service cost in each period (as discussed at 8.2.2 above) less the estimated minimum funding requirement contributions that would be required for future service in those periods if there were no pre-payment as described in (a).

The future minimum funding contributions required in respect of future service should be calculated:

- taking into account the effect of any existing surplus on the minimum funding requirement basis but excluding the pre-payment discussed in (a) immediately above;
- using assumptions consistent with the minimum funding requirement basis. For any factors not specified by the minimum funding requirement, the assumptions used should be consistent with those used to determine the defined benefit obligation and with the situation that exists at the end of the reporting period as determined by IAS 19;
- including any changes expected as a result of the entity paying the minimum contributions when they are due; and
- excluding the effect of expected changes in the terms and conditions of the minimum funding basis that are not substantively enacted or contractually agreed at the end of the reporting period. *[IFRIC 14.21]*.

If the future minimum funding contribution required in respect of future service exceeds the future IAS 19 service cost in any given period, the present value of that excess reduces the amount of the asset available as a reduction in future contributions. However, the amount of the asset available as a reduction in future contributions can never be less than zero. *[IFRIC 14.22]*.

The mechanics of the above requirements are illustrated in the following two examples based on the illustrative examples accompanying IFRIC 14. *[IFRIC 14.IE9-IE27]*. Example 35.4 also illustrates the requirement in certain circumstances to recognise an additional liability for future MFR payments in respect of past service (discussed at 8.2.4 below).

Example 35.4: Deficit-clearing future minimum funding requirements when refunds are not available

An entity has a funding level on the minimum funding requirement basis (which is measured on a different basis from that required under IAS 19) of 95% in Plan C. Under the minimum funding requirements, the entity is required to pay contributions to increase the funding level to 100% over the next three years. The contributions are required to make good the deficit on the minimum funding requirement basis (shortfall) and to cover future service.

Plan C also has an IAS 19 surplus at the end of the reporting period of €50m, which cannot be refunded to the entity under any circumstances. There are no unrecognised amounts.

The nominal amounts of the minimum funding contribution requirements in respect of the shortfall and the future IAS 19 service cost for the next three years are set out below.

	Total minimum funding contribution requirement	Minimum contributions required to make good the shortfall	Minimum contributions required to cover future accrual
Year	€m	€m	€m
1	135	120	15
2	125	112	13
3	115	104	11

The entity's present obligation in respect of services already received includes the contributions required to make good the shortfall but does not include the minimum contributions required to cover future service.

The present value of the entity's obligation, assuming a discount rate of 6% per year, is approximately 300, calculated as follows:

$$€120m \div (1.06) + €112m \div (1.06)^2 + €104m \div (1.06)^3$$

When these contributions are paid into the plan, the IAS 19 surplus (i.e. the fair value of assets less the present value of the defined benefit obligation) would, other things being equal, increase from €50m to €350m. However, the surplus is not refundable although an asset may be available as a future contribution reduction.

As noted above, the economic benefit available as a reduction in future contributions is the present value of:

- the future service cost in each year to the entity; less
- any minimum funding contribution requirements in respect of the future accrual of benefits in that year

over the expected life of the plan.

The amounts available as a future contribution reduction are set out below.

	IAS 19 service cost	Minimum contributions required to cover future accrual	Amount available as contribution reduction
Year	€m	€m	€m
1	13	15	(2)
2	13	13	0
3	13	11	2
4+	13	9	4

Assuming a discount rate of 6%, the economic benefit available as a future contribution reduction is therefore equal to:

$$€(2)m \div (1.06) + €0m \div (1.06)^2 + €2m \div (1.06)^3 + €4m \div (1.06)^4 + €4m \div (1.06)^5 + €4m \div (1.06)^6 \ldots = €56m.$$

The asset available from future contribution reductions is accordingly limited to €56m.

As discussed at 8.2.4 below, IFRIC 14 requires the entity to recognise a liability to the extent that the additional contributions payable will not be fully available. Therefore, the effect of the asset ceiling is to reduce the defined benefit asset by €294m (€50m + €300m – €56m).

As discussed at 10.4 below, the effect of the asset ceiling is part of remeasurements and the €294m is recognised immediately in other comprehensive income and the entity recognises a net liability of €244m. No other liability is recognised in respect of the obligation to make contributions to fund the minimum funding shortfall.

When the contributions of €300m are paid into the plan, the net asset will become €56m (€300m – €244m).

Example 35.5: Effect of a prepayment when a minimum funding requirement exceeds the expected future service charge

An entity is required to fund Plan D so that no deficit arises on the minimum funding basis. The entity is required to pay minimum funding requirement contributions to cover the service cost in each period determined on the minimum funding basis.

Plan D has an IAS 19 surplus of 35 at the beginning of 2017. This example assumes that the discount rate is 0%, and that the plan cannot refund the surplus to the entity under any circumstances but can use the surplus for reductions of future contributions.

The minimum contributions required to cover future service are €15 for each of the next five years. The expected IAS 19 service cost is €10 in each year.

The entity makes a prepayment of €30 at the beginning of 2017 in respect of years 2017 and 2018, increasing its surplus at the beginning of 2017 to €65. That prepayment reduces the future contributions it expects to make in the following two years, as follows:

		Minimum funding requirement contribution:	
Year	IAS 19 service cost (€)	Before pre-payment (€)	After pre-payment (€)
2017	10	15	0
2018	10	15	0
2019	10	15	15
2020	10	15	15
2021	10	15	15
Total	50	75	45

At the beginning of 2017, the economic benefit available as a reduction in future contributions is the sum of:

- 30, being the prepayment of the minimum funding requirement contributions; and
- nil. The estimated minimum funding requirement contributions required for future service would be 75 if there was no prepayment. Those contributions exceed the estimated future service cost (50); therefore the entity cannot use any part of the surplus of 35.

Assuming a discount rate of 0%, the present value of the economic benefit available as a reduction in future contributions is equal to 30. Accordingly, the entity recognises an asset of 30 (because this is lower than the IAS 19 surplus of 65).

Two points worth noting in Example 35.5 above are as follows. The first is that, if IFRIC 14 did not allow the recognition of such prepayments, the full surplus of €65 would have been written off. The second is that, in the fact pattern of the question, it is unnecessary to know that the surplus before the prepayment was €35. This is because any surplus (other than the prepayment of MFR) would not be recognised because refunds are not available and future MFR exceeds future service costs.

8.2.4 IFRIC Interpretation 14 – when a minimum funding requirement may give rise to a liability

If there is an obligation under a minimum funding requirement to pay contributions to cover an existing shortfall on the minimum funding basis in respect of services already received, the entity should determine whether the contributions payable will be available as a refund or reduction in future contributions after they are paid into the plan. *[IFRIC 14.23]*. Recovery through reduced future contributions is discussed at 8.2.2 and 8.2.3 above.

If a surplus is recoverable by way of a refund (see 8.2.1 above), a minimum funding requirement to cover a shortfall in respect of past services will neither restrict an IAS 19 asset nor trigger the recognition of a liability as it will be recoverable with any refund. IFRIC 14 illustrates this by way of an example upon which the following is based. *[IFRIC 14.IE1-2]*.

Example 35.6: Effect of the minimum funding requirement when there is an IAS 19 surplus and the minimum funding contributions payable are fully refundable to the entity

An entity has a funding level on the minimum funding requirement basis (which is measured on a different basis from that required under IAS 19) of 82% in Plan A. Under the minimum funding requirements, the entity is required to increase the funding level to 95% immediately. As a result, the entity has a statutory obligation at the end of the reporting period to contribute €200m to Plan A immediately. The plan rules permit a full refund of any surplus to the entity at the end of the life of the plan. The year-end valuations for Plan A are set out below.

	€million
Fair value of assets	1,200
Present value of defined benefit obligation under IAS 19	(1,100)
Surplus	100
Defined benefit asset (before consideration of the minimum funding requirement)	100

Payment of the contributions of €200m will increase the IAS 19 surplus from €100m to €300m. Under the rules of the plan this amount will be fully refundable to the entity with no associated costs. Therefore, no liability is recognised for the obligation to pay the contributions and the net defined benefit asset will be recognised at €100m.

To the extent that the contributions payable will not be available after they are paid into the plan, a liability should be recognised when the obligation arises. The liability should reduce the net defined benefit asset or increase the net defined benefit liability so that no gain or loss is expected to result from the effect of the asset ceiling when the contributions are paid. *[IFRIC 14.24]*.

IFRIC 14 illustrates this by way of an example upon which the following is based. *[IFRIC 14.IE3-8]*.

Example 35.7: Effect of a minimum funding requirement when there is an IAS 19 deficit and the minimum funding contributions payable would not be fully available

An entity has a funding level on the minimum funding requirement basis (which is measured on a different basis from that required under IAS 19) of 77% in Plan B. Under the minimum funding requirements, the entity is required to increase the funding level to 100% immediately. As a result, the entity has a statutory obligation at the end of the reporting period to pay additional contributions of €300m to Plan B. The plan rules permit a maximum refund of 60% of the IAS 19 surplus to the entity and the entity is not permitted to reduce its contributions below a specified level which happens to equal the IAS 19 service cost. The year-end valuations for Plan B are set out below.

	€million
Fair value of assets	1,000
Present value of defined benefit obligation under IAS 19	(1,100)
Deficit	(100)

The payment of €300m would change the IAS 19 deficit of €100m to a surplus of €200m. Of this €200m, 60% (€120m) is refundable. Therefore, of the contributions of €300m,

€100m eliminates the IAS 19 deficit and €120m (60% of €200m) is available as an economic benefit. The remaining €80m (40% of €200m) of the contributions paid is not available to the entity. As discussed above, IFRIC 14 requires the entity to recognise a liability to the extent that the additional contributions payable are not available to it. Accordingly, the net defined benefit liability is €180m, comprising the deficit of €100m plus the additional liability of €80m with €80m also being recognised in other comprehensive income. No other liability is recognised in respect of the statutory obligation to pay contributions of €300m. When the contributions of €300m are paid, the net asset will be €120m. If the entity were required to achieve a 100% funding position at some point in the future, but not immediately, the present value of its contributions over this period would be used in the calculation above.

8.2.5 Pension funding payments contingent on future events within the control of the entity

As entities begin to consider moving away, in part at least, from deficit funding contributions which are fixed payments at fixed dates (which are clearly deficit clearing minimum funding requirements) to contributions contingent on future events, what constitutes a minimum funding requirement becomes more important, especially where it is concluded that an IAS 19 surplus is not recoverable. The definition of plan assets is discussed at 6.1 above and minimum funding requirements are discussed at 8.2.3 above. Where a surplus is not recoverable, under the asset ceiling:

- an instrument recognised as a plan asset would be written off; and
- an arrangement which, whilst not being a plan asset, is considered a minimum funding requirement, would be provided for under IFRIC 14.

However, an arrangement which is considered neither a plan asset nor a minimum funding requirement would not be accounted for until payments are made. An example of such a situation is a requirement to make a contribution to a plan at some multiple of any dividends paid within a specified period. Such a right to receive a contribution in these circumstances may or may not meet the definition of a plan asset depending on its precise terms (in particular, whether the right is a 'transferable' one).

In this situation, a funding payment only happens as a result of an action within the control of the entity. Accordingly, such an obligation on a stand-alone basis would not be considered a financial liability under IAS 32 – *Financial Instruments: Presentation.*

This leads to the key consideration of what accounting treatment to apply to a binding agreement requiring the making of payments to a plan only if the entity undertakes a separate transaction which is wholly within its control:

- if the corresponding entitlement of the plan does not meet the definition of a plan asset (for example, if it is non-transferable); and
- it is considered not to be a minimum funding requirement (as it is contingent on the actions of the entity).

Two possibilities present themselves, which would have quite different accounting consequences.

One view may be that these contingent contributions would meet the definition of a minimum funding requirement. IAS 19 is based on the best estimates of ultimate cashflows and it is unequivocal that cashflows used to calculate the defined benefit obligation include the effect of actions which are within the control of the entity. Most obviously, both continued employment and pay increases are within the control of the employer and are estimated to determine the defined benefit obligation and service cost (see 7.5 above). Therefore, if the defined benefit obligation reflects a best estimate of future actions within the control of the entity, an argument could be made that a similar approach could be taken to funding payments. If it is believed that contingent contributions meet the definition of a minimum funding requirement, any accounting consequences of them would be recognised at the inception of the agreement. Under this view the entity would need to make a best estimate of the amount and timing of any future contributions, and determine whether an additional liability arises under IFRIC 14 where these would not be recoverable (see 8.2.4 above).

An alternative view that contingent funding is not a minimum funding requirement could be formed by analogy to IAS 32 or IAS 37. A cash payment which the entity could avoid would not generally be accounted for as a financial liability under IAS 32. It could be argued that it would therefore not be encompassed within the phrase 'any requirement to fund'. Under this analysis the definition of a plan asset (see 6.1 above) becomes particularly important. A transferable instrument would be a plan asset, and would be written off under the asset ceiling mechanism if it is not considered recoverable under IFRIC 14. A non-transferable instrument would not meet the definition of a plan asset. If such an instrument was not considered a minimum funding requirement (because it could be avoided by the entity) it would not be accounted for until a payment were made.

If analogy were made to IAS 37, the presence of a constructive obligation could trigger recognition of a liability in respect of irrecoverable minimum funding payments at the moment it becomes probable that an outflow of resources will be required to settle the obligation and it can be estimated reliably.

The appropriate accounting treatment of any particular arrangement will require judgement to be made based on the individual facts and circumstances.

9 DEFINED BENEFIT PLANS – PRESENTATION OF THE NET DEFINED BENEFIT LIABILITY (ASSET)

Neither IAS 19 nor IAS 1 specifies where in the statement of financial position a net asset or net liability in respect of a defined benefit plan should be presented, nor whether such balances should be shown separately on the face of the statement of financial position or only in the notes – this is left to the discretion of the reporting entity subject to the general requirements of IAS 1 discussed in Chapter 3 at 3.1. If the format of the statement of financial position distinguishes current assets and liabilities from non-current ones, the question arises as to whether this split needs also to be made for pension balances. IAS 19 does not specify whether such a split should be made, on the grounds that it may sometimes be arbitrary. *[IAS 19.133, BC200]*.

Employers with more than one plan may find that some are in surplus while others are in deficit. IAS 19 contains offset criteria closely modelled on those in IAS 32. *[IAS 19.132]*. An asset relating to one plan may only be offset against a liability relating to another plan when there is a legally enforceable right to use a surplus in one plan to settle obligations under the other plan, and the employer intends to settle the obligations on a net basis or realise the surplus and settle the obligation simultaneously. *[IAS 19.131]*. We believe that these offset criteria are unlikely to be met in practice.

10 DEFINED BENEFIT PLANS – TREATMENT IN PROFIT OR LOSS AND OTHER COMPREHENSIVE INCOME

IAS 19 identifies three components of annual pension cost as follows:

(a) service cost (see 10.1 below);

(b) net interest on the net defined benefit liability (asset) (see 10.3 below); and

(c) remeasurements of the net defined benefit liability (see 10.4 below). *[IAS 19.120]*.

Of these, (a) and (b) are recognised in profit or loss and (c) is recognised in other comprehensive income. This is unless another standard requires or permits the costs to be included in the cost of an asset, for example IAS 2 – *Inventories* – and IAS 16 – *Property, Plant and Equipment*. Where the post-employment benefit costs are included in the cost of an asset the appropriate proportion of all the above items must be included. *[IAS 19.121]*. There is no guidance in the standard as to what an 'appropriate' proportion of these items might be, although both IAS 2 and IAS 16 are clear that only those costs which are directly attributable to the asset qualify for capitalisation. It is not necessarily the case that the appropriate proportion will be the same for all of the components and judgement will be required in deciding how much of each item can meaningfully be said to relate to the production of an asset.

Remeasurements recognised in other comprehensive income should not be reclassified to profit and loss in a subsequent period. The standard notes that those amounts may be transferred within equity. *[IAS 19.122]*.

The standard states that it does not specify how an entity should present service cost and net interest on the net defined benefit liability or asset. The presentation of these components in the profit and loss account are accounted for in accordance with IAS 1 (see Chapter 3 at 3.2) and could either be included in one line or split between lines in the income statement according to its nature. *[IAS 19.134]*. For example, the net interest could be presented in the income statement along with other finance items.

10.1 Service cost

Service cost comprises:

(a) current service cost – the increase in the present value of the defined benefit obligation resulting from employee service in the current period;

(b) past service cost –the change in the present value of the defined benefit obligation for employee service in prior periods, resulting from a plan amendment (the introduction or withdrawal of, or changes to, a defined benefit plan) or a curtailment (a significant reduction by the entity in the number of employees covered by a plan); and

(c) any gain or loss on settlement –the difference, at the date of settlement, between the present value of the defined benefit obligation being settled and the settlement price, including any plan assets transferred and any payments made directly by the entity in connection with the settlement. *[IAS 19.8, 109]*. The gain or loss is recognised when the settlement occurs. *[IAS 19.110]*.

The current service cost should be determined using the projected unit credit method. *[IAS 19.67]*. The basic computation is illustrated in Example 35.2 at 7.3 above.

There is no need to distinguish between past service cost resulting from a plan amendment, past service cost resulting from a curtailment and a gain or loss on settlement if these transactions occur together. In some cases, a plan amendment occurs before a settlement, such as when an entity changes the benefits under the plan and settles the amended benefits later. In those cases an entity recognises past service cost before any gain or loss on settlement. *[IAS 19.8, 100]*.

A settlement occurs together with a plan amendment and curtailment if a plan is terminated with the result that the obligation is settled and the plan ceases to exist. However, the termination of a plan is not a settlement if the plan is replaced by a new plan that offers benefits that are, in substance, the same. *[IAS 19.101]*.

10.2 Changes in a defined benefit plan

Accounting for past service costs (plan amendments or curtailments) and settlements are discussed in sections 10.2.1 and 10.2.3 below, respectively. The acquisition of a qualifying insurance policy not directly connected with a settlement is discussed at 10.2.2 below. Each of these sections detail where any gain or loss arising is recorded which will either be in the profit and loss account or other comprehensive income.

In summary, when determining the effect of such a transaction, the net defined benefit liability (asset) should be remeasured using up to date values for plan assets and actuarial assumptions before and after the event to determine the effect of it. *[IAS 19.99]*.

Any past service cost, or gain or loss on settlement should be recognised and measured without considering the effect of the asset ceiling (see 8.2 above). The effect of the asset ceiling should then be determined after the plan amendment, curtailment or settlement with any change in that effect, excluding amounts included in net interest, recognised in other comprehensive income. *[IAS 19.101A]*.

Current service cost should ordinarily be determined using actuarial assumptions as at the start of the reporting period. However, as discussed at 10.2.1 below, a plan amendment, curtailment or settlement during a reporting period will require remeasurement of the net defined benefit liability (asset). In such cases the current service cost for the remainder of the period, that is, after the plan amendment, curtailment or settlement, should be calculated using the actuarial assumptions used to for the remeasurement. *[IAS 19.122A]*.

The point in time at which a plan amendment occurs will often be a matter of fact based on the legal entitlements of plan members. Judgement may be required, based on individual facts and circumstances, if the benefits concerned constitute constructive, as opposed to legal, obligations (see 7.1 above).

Sometimes benefit plans are amended in such a way as to allow members a choice, for a limited period, between two or more benefit arrangements. In such cases a plan amendment occurs (and a positive or negative past service cost will be recognised) on the date at which the new arrangement comes into existence (legally or constructively) and not at the later date by which members are required to make their choice. This may mean that the initial accounting for the plan amendment will require estimates to be made of the choices which members will make. However, if it is known, at the time the relevant financial statements are prepared, what choices members have made (for example, because the 'window' for making selections closes before the financial statements are authorised for issue) this definitive data would remove the need for estimation. Any subsequent changes in estimates in the following years resulting from the confirmation process would be a change in estimate and recognised as a remeasurement gain or loss.

10.2.1 Past service cost

Past service cost is the change in the present value of the defined benefit obligation resulting from a plan amendment or curtailment. *[IAS 19.8, 102]*.

Past service costs should be recognised at the earlier of the date when:

(a) the plan amendment or curtailment occurs; and

(b) the entity recognises related restructuring costs in accordance with IAS 37 (discussed in Chapter 26 at 6.1). *[IAS 19.8, 103]*.

A plan amendment occurs when an entity introduces, or withdraws, a defined benefit plan or changes the benefits payable under an existing defined benefit plan. *[IAS 19.8, 104]*.

A curtailment occurs when an entity significantly reduces the number of employees covered by a plan. A curtailment may arise from an isolated event, such as the closing of a plant, discontinuance of an operation or termination or suspension of a plan. *[IAS 19.8, 105]*.

Past service cost may be either positive (when benefits are introduced or changed so that the present value of the defined benefit obligation increases) or negative (when benefits are withdrawn or changed so that the present value of the defined benefit obligation decreases). *[IAS 19.8, 106]*.

Where an entity reduces benefits payable under an existing defined benefit plan and, at the same time, increases other benefits payable under the plan for the same employees, the entity treats the change as a single net change. *[IAS 19.8, 107]*.

Past service cost excludes:

(a) the effect of differences between actual and previously assumed salary increases on the obligation to pay benefits for service in prior years (there is no past service cost because actuarial assumptions allow for projected salaries, accordingly the effect of any such difference is an actuarial gain or loss – see 7.5 above);

(b) under- and over-estimates of discretionary pension increases when an entity has a constructive obligation to grant such increases (there is no past service cost because actuarial assumptions allow for such increases, accordingly the effect of any such under- or over-estimate is an actuarial gain or loss – see 7.5 above);

(c) estimates of benefit improvements that result from actuarial gains or from the return on plan assets that have been recognised in the financial statements if the entity is obliged, by either the formal terms of a plan (or a constructive obligation that goes beyond those terms) or legislation, to use any surplus in the plan for the benefit of plan participants, even if the benefit increase has not yet been formally awarded (the resulting increase in the obligation is an actuarial loss and not past service cost, see 7.5 above); and

(d) the increase in vested benefits (that is, those not conditional on future employment) when, in the absence of new or improved benefits, employees complete vesting requirements (there is no past service cost because the estimated cost of benefits was recognised as current service cost as the service was rendered, accordingly the effect of any such increase is an actuarial gain or loss, see 7.5 above). *[IAS 19.108]*.

10.2.2 *Acquisition of a qualifying insurance policy*

IAS 19 observes that an employer may acquire an insurance policy to fund some or all of the employee benefits relating to employee service in the current and prior periods. The acquisition of such a policy is not a settlement if the employer retains a legal or constructive obligation to pay further amounts if the insurer does not pay the employee benefits specified in the insurance policy (often referred to as a buy-in). *[IAS 19.112]*. However, the acquisition of an insurance policy will mean an entity has an asset which needs to be measured at fair value. As discussed at 6.2 above, certain insurance policies are valued at an amount equal to the present value of the defined benefit obligation which they match. The cost of buying such a policy will typically greatly exceed its subsequent carrying amount. This loss is seen as an actuarial loss as it results from exchanging one plan asset for another, which is recognised in other comprehensive income, unless in substance the acquisition of the qualifying insurance policy is a settlement of the plan (see 10.2.3 below).

10.2.3 *Settlements*

IAS 19 defines a settlement as a transaction that eliminates all further legal or constructive obligations for part or all of the benefits provided under a defined benefit plan, other than a payment of benefits to, or on behalf of, employees that is set out in the terms of the plan and included in the actuarial assumptions. *[IAS 19.8]*.

In other words, settlement occurs at the point of absolute risk extinguishment, for part or all of the employer obligations.

For example, a one-off transfer of significant employer obligations under the plan to an insurance company through the purchase of an insurance policy (often referred to as a buy-out) is a settlement; a lump sum cash payment, under the terms of the plan, to plan participants in exchange for their rights to receive specified post-employment benefits is not. *[IAS 19.111]*.

The interaction between the asset ceiling and past service cost or a gain or loss on settlement is discussed further at 10.2.1 above.

Any transactions in advance of the legal date of a settlement would also need to be considered. For example, an entity may enter into a binding commitment to settle a defined benefit obligation in the future with an insurance company, which as at the year-end date is beyond recall, but legally risk only transfers to the insurer after the year end.

In this situation, the loss on settlement must be recognised at the point of commitment. However, the defined benefit obligation and related assets will remain on the statement of financial position until legal settlement occurs.

The following extract from IHG plc illustrates a buy-in which has occurred in one financial period and followed by a buy-out in the following financial period. As the policy was structured so as to enable the plan to move to a buy-out, and the intention was to proceed on that basis, the buy-in transaction was accounted for as a settlement with the loss arising recorded in the income statement.

Extract 35.1: InterContinental Hotels Group PLC (2014)

Notes to the Group Financial Statements [extract]

25. Retirement benefits [extract]

UK [extract]

Historically UK retirement and death in service benefits have been provided for eligible employees in the UK principally by the InterContinental Hotels UK Pension Plan, which has both defined benefit and defined contribution sections. The defined benefit section was subject to a buy-in transaction on 15 August 2013 whereby the assets of the plan were invested in a bulk purchase annuity policy with the insurer Rothesay Life under which the benefits payable to defined benefit members became fully insured. On 31 October 2014, the plan completed the move to a full buy-out of the defined benefit section, following which Rothesay Life has become fully and directly responsible for the pension obligations. On completion of the buy-out, the defined benefit assets (comprising the Rothesay Life insurance policy) and matching defined benefit liabilities were derecognised from the Group Statement of financial position.

US and other [extract]

In respect of the defined benefit plans, the amounts recognised in the Group income statement, in administrative expenses, are:

	Pension plans											
			UK			US and other			Post-employment benefits			Total
	2014	2013	2012	**2014**	2013	2012	**2014**	2013	2012	**2014**	2013	2012
	$m	$m	$m	**$m**	$m	$m	**$m**	$m	$m	**$m**	$m	$m
Current service cost	**–**	2	5	**1**	1	1	**–**	–	–	**1**	3	6
Past service cost	**–**	–	–	**–**	1	–	**–**	–	–	**–**	1	–

Exceptional items:												
Settlement cost	**6**	147	–	**–**	–	–	**–**	–	–	**6**	147	–
	11	150	7	**4**	6	5	**1**	1	1	**16**	157	13

[...]

The settlement cost in 2013 resulted from the buy-in transaction described on the previous page and comprised a past service cost of $5m relating to additional benefits secured by the transaction, the $137m difference between the cost of the insurance policy and the accounting value of the liabilities secured and transaction costs of $5m. As the policy was structured to enable the plan to move to a buy-out and the intention was to proceed on that basis, the buy-in transaction was accounted for as a settlement with the loss arising recorded in the income statement. The full buy-out was completed on 31 October 2014.

10.3 Net interest on the net defined benefit liability (asset)

Net interest on the net defined benefit liability (asset) is the change during the period in the net defined benefit liability (asset) that arises from the passage of time. *[IAS 19.8]*. It is determined by multiplying the net defined benefit liability (asset) by the discount rate (see 7.6 above which also discusses the use of a more granular approach to determining the discount rate) taking into account any changes in the net defined benefit liability (asset) during the period resulting from contributions or benefit payments. *[IAS 19.123, 123A]*.

Unless there are certain plan changes in the period, the discount rate used for the whole period is that determined at the start of the reporting period. However, if the net defined benefit liability (asset) is remeasured to determine a past service cost, or a gain or loss on settlement the net interest for the remainder of the reporting period is determined using: *[IAS 19.123A]*

(a) the net defined benefit liability (asset) reflecting the benefits offered after the plan amendment, curtailment or settlement; and

(b) the discount rate used to remeasure the net defined benefit liability (asset).

Accounting for defined benefit schemes in interim financial statements is discussed in Chapter 41 at 9.3.3.

As the net item in the statement of financial position is comprised of up to three separate components (the defined benefit obligation, plan assets and the asset ceiling), the net interest is made up of interest unwinding on each of these components in the manner described above. *[IAS 19.124]*. Although, computationally, the net interest is so composed, for the purposes of presentation in profit or loss it is a single net amount.

Interest on plan assets calculated as described above will not, other than by coincidence, be the same as the actual return on plan assets. The difference is a remeasurement recognised in other comprehensive income (see 10.4.2 below). If the net plan liability (asset) is remeasured as a result of a plan amendment, curtailment or settlement the entity shall determine interest income for the remainder of the annual reporting period after the plan amendment, curtailment or settlement using the plan assets used to remeasure the net defined benefit liability (asset). In performing this calculation the entity shall also take into account any changes in the plan assets held during the period resulting from contributions or benefit payments. *[IAS 19.125]*.

Similarly, the difference in the asset ceiling between the start and end of the period is unlikely to equal the interest on this component described above. An entity shall determine the effect of the asset ceiling at the start of the annual reporting period. However, if an entity remeasures the net defined benefit liability (asset) as a result of a plan amendment, curtailment or settlement, the entity shall determine interest on the effect of the asset ceiling for the remainder of the annual reporting period after the plan amendment, curtailment or settlement taking into account any change in the effect of the asset ceiling as discussed in 10.2 above. The difference between the total change in the effect of the asset ceiling and the interest effect is accounted for as a remeasurement in other comprehensive income. *[IAS 19.126]*.

10.4 Remeasurements

Remeasurements of the net defined benefit liability (asset) comprise:

(a) actuarial gains and losses;

(b) the return on plan assets, excluding amounts included in net interest on the net defined benefit liability (asset); and

(c) any change in the effect of the asset ceiling (see 8.2 above), excluding amounts included in net interest on the net defined benefit liability (asset). *[IAS 19.8, 127]*.

10.4.1 Actuarial gains and losses

Actuarial gains and losses are changes in the present value of the defined benefit obligation resulting from: experience adjustments (the effects of differences between the previous actuarial assumptions and what has actually occurred); and the effects of changes in actuarial assumptions. *[IAS 19.8]*. These can result, for example, from:

(a) unexpectedly high or low rates of: employee turnover, early retirement, mortality, increases in salaries or benefits, or medical costs (if the formal or constructive terms of the plan provide for inflationary benefits);

(b) the effect of changes to assumptions concerning benefit payment options;

(c) the effect of changes in estimates of: future employee turnover, early retirement or mortality or of increases in salaries, benefits (if the formal or constructive terms of the plan provide for inflationary benefit increases) or medical costs; and

(d) the effect of changes in the discount rate. *[IAS 19.128]*.

Actuarial gains and losses do not include changes in the present value of the defined benefit obligation because of the introduction, amendment, curtailment or settlement of the defined benefit plan, or changes to the benefits payable under the defined benefit plan. Such changes result in past service cost or gains or losses on settlement (see 10.2.1 and 10.2.3 above). *[IAS 19.129]*.

10.4.2 The return on plan assets, excluding amounts included in net interest on the net defined benefit liability (asset)

The return on plan assets is interest, dividends and other income derived from the plan assets, together with realised and unrealised gains on the assets, less

- any costs of managing plan assets; and
- any tax payable by the plan itself, other than tax included in the actuarial assumptions used to measure the present value of the defined benefit obligation.

Other administration costs are not deducted from the return on plan assets, as discussed further at 11 below. *[IAS 19.130]*.

11 DEFINED BENEFIT PLANS – COSTS OF ADMINISTERING EMPLOYEE BENEFIT PLANS

Some employee benefit plans incur costs as part of delivering employee benefits. The costs are generally more significant for post-retirement benefits such as pensions. Examples of costs include actuarial valuations, audits and the costs of managing any plan assets.

IAS 19 deals with some costs, as discussed below, but is silent on others.

The following costs are required to be factored into the measurement of the defined benefit obligation as part of the actuarial assumptions (see 7.5 above):

- in the case of medical benefits, future medical costs, including claim handling costs (i.e. the costs that will be incurred in processing and resolving claims, including legal and adjuster's fees); and
- taxes payable by the plan on contributions relating to service before the reporting date or on benefits resulting from that service. *[IAS 19.76(b)]*.

The following costs (and no others) are deducted from the return on plan assets (see 10.4.2 above):

- the costs of managing the plan assets; and
- any tax payable by the plan itself, other than tax included in the actuarial assumptions used to measure the defined benefit obligation. *[IAS 19.130]*.

As discussed at 10.3 above, net interest on the net liability or asset is reported in the income statement. This is a wholly computed amount which is uninfluenced by actual asset returns; the difference between actual asset returns and the credit element of the net interest amount forms part of remeasurements reported in other comprehensive income.

So, although not expressed in these terms, costs of administering plan assets and the tax mentioned above are reported in other comprehensive income.

The standard is silent on the treatment of any other costs of administering employee benefit plans. However, the Basis for Conclusions on IAS 19 contains the following: 'the Board decided that an entity should recognise administration costs when the administration services are provided. This practical expedient avoids the need to attribute costs between current and past service and future service'. *[IAS 19.BC127]*. The Board may well have taken that decision, however it did not include such a requirement in the standard.

In our view, such an approach is certainly an acceptable way to account for costs not dealt with in the standard; however other approaches could be acceptable, for example, in relation to closed schemes as discussed below. Entities need, in compliance with IAS 8, to develop an accounting policy in light of the standard not dealing with these costs. However, IAS 1 is clear that such costs would not be reported in other comprehensive income. *[IAS 1.88]*.

One alternative to simple accruals accounting as costs are incurred could be relevant to closed plans, where employees are no longer exchanging services for defined benefits. In this situation, it is clear that any and all future costs of administering the plan relate to past periods and no attribution is necessary. An entity with such an arrangement may select a policy of full provision of all costs of 'running-off' the plan (apart from those specifically dealt with by the standard).

12 SHORT-TERM EMPLOYEE BENEFITS

Short-term employee benefits are employee benefits (other than termination benefits) that are expected to be settled wholly before twelve months after the end of the annual reporting period in which the employees render the related service. *[IAS 19.8]*.

The standard states that reclassification is not necessary if an entity's expectation of the timing of settlement changes temporarily. However, if the characteristics of the benefit change (such as a change from a non-accumulating benefit to an accumulating benefit) or if a change in expectations of the timing of settlement is not temporary, then the entity considers whether the benefit still meets the definition of short-term employee benefits. *[IAS 19.10]*.

They can include:

- wages, salaries and social security contributions;
- paid annual leave and paid sick leave;
- profit-sharing and bonuses; and
- non-monetary benefits (such as medical care, housing, cars and free or subsidised goods or services) for current employees. *[IAS 19.9]*.

12.1 General recognition criteria for short-term employee benefits

An entity should recognise the undiscounted amount of short-term benefits attributable to services that have been rendered in the period as an expense, unless another IFRS requires or permits the benefits to be included in the cost of an asset. This may particularly be the case under IAS 2 (see Chapter 22 at 3.1), IAS 16 (see Chapter 18 at 4) and IAS 38 – *Intangible Assets* (see Chapter 17 at 6.3.2). Any difference between the amount of cost recognised and cash payments made should be treated as a liability or prepayment as appropriate. *[IAS 19.11]*. There are further requirements in respect of short-term paid absences and profit-sharing and bonus plans as detailed below. Cost is not defined in IAS 19 and therefore the accounting for such benefits may vary depending on any other standards involved in the recognition of the transaction.

12.2 Short-term paid absences

These include absences for vacation (holiday), sickness and short-term disability, maternity or paternity leave, jury service and military service. These can either be accumulating or non-accumulating absences. *[IAS 19.14]*. Accumulating absences are those that can be carried forward and used in future periods if the entitlement in the current period is not used in full. They can be either vesting entitlements (which entitle employees to a cash payment in lieu of absences not taken on leaving the entity) or non-vesting entitlements (where no cash compensation is payable). Non-accumulating absences are those where there is no entitlement to carry forward unused days. An obligation arises as employees render service that increases their entitlement to future paid absences. *[IAS 19.15]*.

12.2.1 Accumulating absences

The cost of accumulating paid absences should be recognised when employees render the service that increases their entitlement to future paid absences. No distinction should be made between the recognition of vesting and non-vesting entitlements (see 12.2 above), on the basis that the liability arises as services are rendered in both cases. However, the measurement of non-vesting entitlements should take into account the possibility of employees leaving before receiving them. *[IAS 19.15]*.

The cost of accumulating paid absences should be measured as the additional amount that the entity expects to pay as a result of the unused entitlement that has accumulated at the end of the reporting period. *[IAS 19.16]*. In the case of unused paid sick leave, provision should be made only to the extent that it is expected that employees will use the sick leave in subsequent periods. The standard observes that in many cases, it may not be necessary to make detailed computations to estimate that there is no material obligation for unused paid absences. For example, IAS 19 considers it unlikely that a sick leave obligation will be material unless if there is a formal or informal understanding that unused paid sick leave may be taken as paid vacation. *[IAS 19.17]*.

The standard provides an example to illustrate the requirements for accumulating paid absences upon which the following is based: *[IAS 19.17]*

Example 35.8: Accumulating paid absences

An entity has 100 employees, who are each entitled to five working days of paid sick leave for each year. Unused sick leave may be carried forward for one calendar year. Sick leave is taken first out of the current year's entitlement and then out of any balance brought forward from the previous year (a LIFO basis). At 31 December 2019, the average unused entitlement is two days per employee. The entity expects, based on past experience which is expected to continue, that 92 employees will take no more than five days of paid sick leave in 2020 and that the remaining eight employees will take an average of six and a half days each.

The entity expects that it will pay an additional 12 days of sick pay as a result of the unused entitlement that has accumulated at 31 December 2019 (one and a half days each, for eight employees). Therefore, the entity recognises a liability equal to 12 days of sick pay.

12.2.2 Non-accumulating paid absences

The cost of non-accumulating absences should be recognised as and when they arise, on the basis that the entitlement is not directly linked to the service rendered by employees in the period. This is commonly the case for sick pay (to the extent that unused past entitlement cannot be carried forward), maternity or paternity leave, furlough periods and paid absences for jury service or military service. *[IAS 19.13(b), 18]*.

12.3 Profit-sharing and bonus plans

An entity should recognise the expected cost of profit-sharing and bonus payments when and only when:

- the entity has a present legal or constructive obligation to make such payments as a result of past events; and
- a reliable estimate of the obligation can be made. *[IAS 19.19]*.

The above are discussed in turn at 12.3.1 and 12.3.2 below. Statutory profit-sharing arrangements based on taxable profit are discussed at 12.3.3 below.

12.3.1 Present legal or constructive obligation

A present obligation exists when, and only when, the entity has no realistic alternative but to make the payments. *[IAS 19.19]*. IAS 19 clarifies that where a profit-sharing plan is subject to a loyalty period (i.e. a period during which employees must remain with the entity in order to receive their share), a constructive obligation is created as employees render service that increases the amount to be paid if they remain in service until the end of the specified period. However, the possibility of employees leaving during the loyalty period should be taken into account in measuring the cost of the plan. *[IAS 19.20]*. The standard illustrates the approach as follows:

Example 35.9: Profit sharing and bonus plans

A profit-sharing plan requires an entity to pay a specified proportion of its net profit for the year to employees who serve throughout the year. If no employees leave during the year, the total profit-sharing payments for the year will be 3% of profit. The entity estimates that staff turnover will reduce the payments to 2.5% of profit.

The entity recognises a liability and an expense of 2.5% of net profit.

It is worth noting that in the scenario above, when an entity prepares its accounts for the year it will no longer be uncertain whether all eligible employees become entitled to the bonus, as that is determined at the year-end. That means the reduction in the accrual from 3% to 2.5% should be an observable fact not an 'estimate'.

The standard also states that where an entity has a practice of paying bonuses it has a constructive obligation to pay a bonus, even though there may be no legal obligation for it to do so. Again, however, in measuring the cost, the possibility of employees leaving before receiving a bonus should be taken into account. *[IAS 19.21]*.

12.3.2 Reliable estimate of provision

A reliable estimate of a legal or constructive obligation under a profit-sharing or bonus plan can be made when and only when:

- the formal terms of the plan contain a formula for determining the amount of the benefit;
- the entity determines the amounts to be paid before the financial statements are authorised for issue; or
- past practice gives clear evidence of the amount of the entity's constructive obligation. *[IAS 19.22]*.

It is worth noting that the paragraph above from IAS 19 deals only with the measurement of the provision and not the point of recognition which is discussed at 12.3.1 above. IAS 19 states that an obligation under a profit-sharing or bonus plan must be accounted for as an expense and not a distribution of profit, since it results from employee service and not from a transaction with owners. *[IAS 19.23]*. Where profit-sharing and bonus payments are not expected to be settled wholly before twelve months after the end of the annual reporting period in which the employees render the related service, they should be accounted for as other long-term employee benefits (see 13 below). *[IAS 19.24]*.

12.3.3 Statutory profit-sharing based on taxable profit

In November 2010, the Interpretations Committee was asked to clarify how to account for a particular statutory employee benefit whereby 10% of taxable profit is shared with employees. In particular, the request sought clarification as to whether analogy could be made to IAS 12 – *Income Taxes* – to account for temporary differences between accounting and taxable profit which would reverse in the future.

The Interpretations Committee thought that such an approach was not acceptable. It decided not to add the item to its agenda saying '[t]he Committee noted that the statutory employee profit-sharing arrangement described in the request should be accounted for in accordance with IAS 19, and that IAS 19 provides sufficient guidance on amounts that should be recognised and measured, with the result that significantly divergent interpretations are not expected in practice. Consequently, the Committee decided not to add this issue to its agenda'.[15]

13 LONG-TERM EMPLOYEE BENEFITS OTHER THAN POST-EMPLOYMENT BENEFITS

13.1 Meaning of other long-term employee benefits

These are all employee benefits other than post-employment benefits and termination benefits. *[IAS 19.8]*. They include the following if not expected to be settled wholly before twelve months after the end of the annual reporting period in which the employees rendered the related service:

- long-term paid absences such as long-service or sabbatical leave;
- jubilee or other long-service benefits;
- long-term disability benefits;
- profit-sharing and bonuses; and
- deferred remuneration. *[IAS 19.153]*.

13.2 Recognition and measurement

For such benefits IAS 19 requires a simplified version of the accounting treatment required in respect of defined benefit plans (which is discussed in detail at 5 above). The amount recognised as a liability for other long-term employee benefits should be the net total, at the end of the reporting period, of the present value of the defined benefit obligation and the fair value of plan assets (if any) out of which the obligations are to be settled directly. The net total of the following amounts should be recognised in profit or loss, except to the extent that another IFRS requires or permits their inclusion in the cost of an asset:

(a) service cost;

(b) net interest on the net defined benefit liability (asset); and

(c) remeasurements of the net defined benefit liability (asset).

In other words, all assets, liabilities, income and expenditure relating to such benefits should be accounted for in the same way, and subject to the same restrictions on the recognition of assets and income, as those relating to a defined benefit pension plan (see 8.1 and 8.2 above), except that remeasurements are recognised in profit or loss. *[IAS 19.155-156]*.

The standard explains the use of this simplified approach by asserting that the measurement of other long-term employee benefits is not usually subject to the same degree of uncertainty as that of post-employment benefits. *[IAS 19.154]*.

An illustration of the methodology to calculate the defined benefit obligation, service and interest costs is given in Example 35.2 at 7.3 above.

13.2.1 Attribution to years of service

Long-term employee benefit arrangements will typically have conditions attached to secure their vesting.

For example, employee bonuses are now commonly linked to vesting conditions which mean that they will not be settled wholly within 12 months after the period in which the employee renders the related service. In this case, the liability should be calculated using the projected unit credit method and spread on a straight-line basis over the full vesting period. For example, a bonus granted to an employee on 1 January 2021 which is based on the employees performance in 2021, but is not payable until February 2024 and is conditional on the employee remaining in service until 31 December 2023 will have a vesting period from 1 January 2021 to 31 December 2023 and the liability will be spread on a straight line basis over this three year period.

The Interpretations Committee also received questions concerning early retirement bonuses where bonus payments are given in exchange for a 50% reduction in working hours which are conditional on the employee completing a required service period when employment is terminated. The Interpretations Committee concluded that as the bonus payments were conditional upon the completion of service over a specified period this indicated that the benefits were provided in exchange for that service and should be attributed over this period of service (and were not a termination benefit).[16]

It is not always clear how the attribution of long-term benefits to the years of service over which they are earned should be performed.

Consider an award made at the start of the year for a fixed cash payment. A third of the payment vests on each of the first, second and third anniversaries of the grant for employees still employed at each vesting date.

One interpretation would be that the 'benefit formula' attributes a third of the award to each year and that each of the three income statements will bear one third of the expense.

An alternative view is that there are three distinct awards with the same grant date, but with durations of one, two and three years. This pattern of vesting is sometimes described as 'graded vesting' and is discussed, in relation to share-based payments, in Chapter 34 at 6.2.2 and illustrated in Example 34.9.

In our view, either approach is acceptable if applied consistently.

13.2.2 Long-term disability benefit

Where long-term disability benefit depends on the length of service of the employee, an obligation arises as the employee renders service, which is to be measured according to the probability that payment will be required and the length of time for which payment is expected to be made. If, however, the level of benefit is the same for all disabled employees regardless of years of service, the expected cost is recognised only when an event causing disability occurs. *[IAS 19.157]*.

It is not clear why this distinction is made, since in principle both types of benefit are equally susceptible to actuarial measurement. If anything the cost of benefits applicable to all employees regardless of service is probably easier to quantify actuarially. Given that an exposure to disability benefits which grows with years of service is fully provided for (actuarially) as it grows over time, it would seem logical for full provision to be made immediately for an exposure which comes into being (in full) on the day the employee commences employment. The problem with such an approach would be what to do with the debit entry. It would not represent an asset as envisaged in the *Conceptual Framework* (see Chapter 2), which would tend to imply an instant charge to profit or loss. This may have been the reason for the Board to make the exception and link the recognition to the actual disability event. These issues are similar to those surrounding death-in-service benefits discussed at 3.6 above.

13.2.3 Long-term benefits contingent on a future event

It may be the case that a long-term benefit becomes payable only on the occurrence of an uncertain future event, for example an initial public offering of an entity's shares (IPO) or an exit event. Such events are binary in nature and would result in payment either to no employees with entitlements under the plan or to all such employees.

As discussed at 13.2 above, the projected unit credit method is applied to long-term employee benefits, *[IAS 19.154]*, however the key question that arises is whether the accounting should reflect the single best estimate of the outcome; or, the expected value – that is, a weighted average of possible outcomes. Paragraph 72 of the standard states that 'the probability that the specified event will occur affects the measurement of the obligation, but does not determine whether the obligation exists'. This sets out the requirement that probability affects measurement. The manner in which probability affects measurement is dealt with in paragraph 76 which requires actuarial assumptions to be a best estimate of the ultimate cost of providing benefits. Accordingly, we believe that the best estimate of the outcome of the uncertain event should be used when accounting for long-term employee benefits where the outcome is binary. Therefore if an IPO (or exit event) is not probable the liability should be measured at nil. When the IPO (or exit event) is or becomes probable (that is, more likely than not) the actuarial assumption used in applying the projected unit credit method should reflect the full benefits which would be payable upon the occurrence of the event.

14 TERMINATION BENEFITS

Termination benefits are employee benefits payable as a result of either:

- an entity's decision to terminate an employee's employment before the normal retirement date; or
- an employee's decision to accept an offer of benefits in exchange for the termination of employment. *[IAS 19.8]*.

They are accounted for differently from other employee benefits because the event that gives rise to an obligation for them is the termination of employment rather than the rendering of service by the employee. *[IAS 19.159]*.

Termination benefits do not include employee benefits resulting from termination of employment at the request of the employee without an entity's offer, or as a result of mandatory retirement requirements, because those benefits are post-employment benefits. Some entities provide a lower level of benefit for termination of employment at the request of the employee (in substance, a post-employment benefit) than for termination of employment at the request of the entity. The difference between the benefit provided for termination of employment at the request of the employee and a higher benefit provided at the request of the entity is a termination benefit. *[IAS 19.160]*. Accordingly, employee benefits that are payable regardless of the reason for the employee's departure are accounted for as post-employment benefits. Any additional benefit payable as a result of termination at the request of the entity over the benefits payable as a result of termination at the request of the employee is accounted for as a termination benefit.

The form of the employee benefit does not determine whether it is provided in exchange for service or in exchange for termination of the employee's employment. Termination benefits are typically lump sum payments, but sometimes also include:

- enhancement of post-employment benefits, either indirectly through an employee benefit plan or directly; and
- salary until the end of a specified notice period if the employee renders no further service that provides economic benefits to the entity. *[IAS 19.161]*.

Indicators that an employee benefit is provided in exchange for services include the following:

- the benefit is conditional on future service being provided (including benefits that increase if further service is provided); and
- the benefit is provided in accordance with the terms of an employee benefit plan. *[IAS 19.162]*.

Some termination benefits are provided in accordance with the terms of an existing employee benefit plan. For example, they may be specified by statute, employment contract or union agreement, or may be implied as a result of the employer's past practice of providing similar benefits. As another example, if an entity makes an offer of benefits available for more than a short period, or there is more than a short period between the offer and the expected date of actual termination, an entity should consider whether it has established a new employee benefit plan and hence whether the benefits offered under that plan are termination benefits or post-employment benefits. Employee benefits provided in accordance with the terms of an employee benefit plan are termination benefits if they both result from an entity's decision to terminate an employee's employment and are not conditional on future service being provided. *[IAS 19.163]*. Benefits payable to incentivise employees to remain in service with the entity until the end of the termination period (referred to as stay bonuses) are not termination benefits because they are dependent on service being provided. These would be accounted for as either a short-term or long-term employee benefit as appropriate (see 12 and 13 above).

14.1 Statutory termination indemnities

Some employee benefits are provided regardless of the reason for the employee's departure. The payment of such benefits is certain (subject to any vesting or minimum service requirements) but the timing of their payment is uncertain. Although such benefits are described in some jurisdictions as termination indemnities or termination gratuities, they are post-employment benefits rather than termination benefits, and an entity accounts for them as post-employment benefits. *[IAS 19.164]*.

14.2 Recognition

An entity should recognise termination benefits as a liability and an expense at the earlier of the following dates:

- when it can no longer withdraw the offer of those benefits; and
- when it recognises costs for a restructuring that is within the scope of IAS 37 and involves the payment of termination benefits (discussed in Chapter 26 at 6.1). *[IAS 19.165]*.

For termination benefits payable as a result of an employee's decision to accept an offer of benefits in exchange for the termination of employment, the time when an entity can no longer withdraw the offer of termination benefits is the earlier of:

- when the employee accepts the offer; and
- when a restriction (e.g. a legal, regulatory or contractual requirement or other restriction) on the entity's ability to withdraw the offer takes effect. This would be when the offer is made, if the restriction existed at the time of the offer. *[IAS 19.166]*.

For termination benefits payable as a result of an entity's decision to terminate an employee's employment, the entity can no longer withdraw the offer when the entity has communicated to the affected employees a plan of termination meeting all of the following criteria:

- actions required to complete the plan indicate that it is unlikely that significant changes to the plan will be made;
- the plan identifies the number of employees whose employment is to be terminated, their job classifications or functions and their locations (but the plan need not identify each individual employee) and the expected completion date; and
- the plan establishes the termination benefits that employees will receive in sufficient detail that employees can determine the type and amount of benefits they will receive were their employment to be terminated. *[IAS 19.167]*.

The standard notes that when an entity recognises termination benefits, it may also have to account for a plan amendment or a curtailment of other employee benefits (discussed at 10.2 above). *[IAS 19.168]*.

14.3 Measurement

IAS 19 requires that on initial recognition and subsequent remeasurement, termination benefits should be measured in accordance with the nature of the employee benefit. If the termination benefits are an enhancement to post-employment benefits, the entity applies the requirements for post-employment benefits. Otherwise:

- if the termination benefits are expected to be settled wholly before twelve months after the end of the annual reporting period in which the termination benefit is recognised, the requirements for short-term employee benefits should be applied (discussed at 12 above); and
- if the termination benefits are not expected to be settled wholly before twelve months after the end of the annual reporting period, the requirements for other long-term employee benefits should be applied (discussed at 13 above). *[IAS 19.169]*.

Because termination benefits are not provided in exchange for service, the standard notes that its rules relating to the attribution of the benefit to periods of service are not relevant (discussed at 7.4 above). *[IAS 19.170]*.

IAS 19 illustrates the accounting for termination benefits with an example.

Example 35.10: Termination benefits

Background

As a result of a recent acquisition, an entity plans to close a factory in ten months and, at that time, terminate the employment of all of the remaining employees at the factory. Because the entity needs the expertise of the employees at the factory to complete some contracts, it announces a plan of termination as follows.

Each employee who stays and renders service until the closure of the factory will receive on the termination date a cash payment of $30,000. Employees leaving before closure of the factory will receive $10,000.

There are 120 employees at the factory. At the time of announcing the plan, the entity expects 20 of them to leave before closure. Therefore, the total expected cash outflows under the plan are $3,200,000 (i.e. 20 × $10,000 + 100 × $30,000). As required by the standard, the entity accounts for benefits provided in exchange for termination of employment as termination benefits and accounts for benefits provided in exchange for services as short-term employee benefits.

Termination benefits

The benefit provided in exchange for termination of employment is $10,000. This is the amount that an entity would have to pay for terminating the employment regardless of whether the employees stay and render service until closure of the factory or they leave before closure. Even though the employees can leave before closure, the termination of all employees' employment is a result of the entity's decision to close the factory and terminate their employment (i.e. all employees will leave employment when the factory closes). Therefore the entity recognises a liability of $1,200,000 (i.e. 120 × $10,000) for the termination benefits provided in accordance with the employee benefit plan at the earlier of when the plan of termination is announced and when the entity recognises the restructuring costs associated with the closure of the factory.

Benefits provided in exchange for service

The incremental benefits that employees will receive if they provide services for the full ten-month period are in exchange for services provided over that period. The entity accounts for them as short-term employee benefits because the entity expects to settle them before twelve months after the end of the annual reporting period. In this example, discounting is not required, so an expense of $200,000 (i.e. $2,000,000 ÷ 10) is recognised in each month during the service period of ten months, with a corresponding increase in the carrying amount of the liability.

15 DISCLOSURE REQUIREMENTS

15.1 Defined contribution plans

IAS 19 requires the disclosure of the expense recognised for defined contribution plans. It also notes that IAS 24 requires disclosure of the contributions in respect of key management personnel. *[IAS 19.53, 54]*.

15.2 Defined benefit plans

IAS 19 requires extensive disclosure in relation to defined benefit plans, as set out below.

The standard requires an entity to disclose information that:

(a) explains the characteristics of its defined benefit plans and risks associated with them;

(b) identifies and explains the amounts in its financial statements arising from its defined benefit plans; and

(c) describes how its defined benefit plans may affect the amount, timing and uncertainty of the entity's future cash flows. *[IAS 19.135]*.

To achieve the above, the standard sets out a long and detailed list of narrative and numerical disclosure requirements (considered further below).

The Board also noted that entities must comply with the general materiality requirements of IAS 1 (discussed in Chapter 3 at 4.1.5), including the requirement to disclose additional information if necessary, and that the financial statements need not contain disclosures that are not material. *[IAS 19.BC209]*.

One of the Board's objectives in regard to disclosure was to ensure that financial statements provide relevant information that is not obscured by excessive detail. *[IAS 19.BC207]*.

These references to excessive detail and non-disclosure of immaterial items confirm that entities should apply judgement to determine the appropriate level of detail to be provided rather than giving everything set out in the standard.

To meet the objectives above, the standard requires consideration of all the following:

(a) the level of detail necessary to satisfy the disclosure requirements;

(b) how much emphasis to place on each of the various requirements;

(c) how much aggregation or disaggregation to undertake; and

(d) whether users of financial statements need additional information to evaluate the quantitative information disclosed. *[IAS 19.136]*.

If the disclosures provided in accordance with the requirements of IAS 19 and other IFRSs are insufficient to meet the objectives above, an entity should disclose additional information necessary to meet those objectives. For example, an entity may present an analysis of the present value of the defined benefit obligation that distinguishes the nature, characteristics and risks of the obligation. Such a disclosure could distinguish:

(a) between amounts owing to active members, deferred members, and pensioners;
(b) between vested benefits and accrued but not vested benefits; and
(c) between conditional benefits, amounts attributable to future salary increases and other benefits. *[IAS 19.137]*.

An assessment should be made as to whether all or some disclosures should be disaggregated to distinguish plans or groups of plans with materially different risks. For example, an entity may disaggregate disclosure about plans showing one or more of the following features:

(a) different geographical locations;
(b) different characteristics such as flat salary pension plans, final salary pension plans or post-employment medical plans;
(c) different regulatory environments;
(d) different reporting segments; and
(e) different funding arrangements (e.g. wholly unfunded, wholly funded or partly funded). *[IAS 19.138]*.

15.2.1 Characteristics of defined benefit plans and risks associated with them

IAS 19 requires disclosure of:

(a) information about the characteristics of its defined benefit plans, including:
    (i) the nature of the benefits provided by the plan (e.g. final salary defined benefit plan or contribution-based plan with guarantee);
    (ii) a description of the regulatory framework in which the plan operates, for example the level of any minimum funding requirements, and any effect of the regulatory framework on the plan, such as the asset ceiling;
    (iii) a description of any other entity's responsibilities for the governance of the plan, for example responsibilities of trustees or of board members of the plan; and
(b) a description of the risks to which the plan exposes the entity, focused on any unusual, entity-specific or plan-specific risks, and of any significant concentrations of risk. For example, if plan assets are invested primarily in one class of investments, e.g. property, the plan may expose the entity to a concentration of property market risk; and
(c) a description of any plan amendments, curtailments and settlements. *[IAS 19.139]*.

15.2.2 Explanation of amounts in the financial statements

The disclosures should provide a reconciliation from the opening balance to the closing balance for each of the following, if applicable:

(a) the net defined benefit liability (asset), showing separate reconciliations for:
  (i) plan assets;
  (ii) the present value of the defined benefit obligation; and
  (iii) the effect of the asset ceiling; and

(b) any reimbursement rights. If there are reimbursement rights a description of the relationship between them and the related obligation should be given. *[IAS 19.140]*.

Each reconciliation listed in (a) and (b) above should show each of the following, if applicable:

(a) current service cost;

(b) interest income or expense (see 10.3 above);

(c) remeasurements of the net defined benefit liability (asset), showing separately:
  (i) the return on plan assets, excluding amounts included in interest in (b) above;
  (ii) actuarial gains and losses arising from changes in demographic assumptions;
  (iii) actuarial gains and losses arising from changes in financial assumptions; and
  (iv) changes in the effect of limiting a net defined benefit asset to the asset ceiling, excluding amounts included in interest in (b). There should also be disclosure of how the maximum economic benefit available was determined, i.e. whether those benefits would be in the form of refunds, reductions in future contributions or a combination of both;

(d) past service cost and gains and losses arising from settlements. Past service cost and gains and losses arising from settlements need not be distinguished if they occur together (see 10.2 above);

(e) the effect of changes in foreign exchange rates;

(f) contributions to the plan, showing separately those by the employer and by plan participants;

(g) payments from the plan, showing separately the amount paid in respect of any settlements; and

(h) the effects of business combinations and disposals. *[IAS 19.141]*.

The following extract from BT Group plc shows how they have presented the above reconciliations.

Movements in defined benefit plan assets and liabilities

The table below shows the movements on the pension assets and liabilities and shows where they are reflected in the financial statements.

	Assets £m	Liabilities £m	Deficit £m
At 31 March 2016	43,968	(50,350)	(6,382)
Service cost (including administration expenses and PPF levy)	(44)	(237)	(281)
Interest on pension deficit	1,413	(1,622)	(209)
Included in the group income statement			**(490)**
Return on plan assets above the amount included in the group income statement	7,475	–	7,475
Actuarial loss arising from changes in financial assumptions[a]	–	(10,221)	(10,221)
Actuarial loss arising from changes in demographic assumptions[a]	–	(206)	(206)
Actuarial gain arising from experience adjustments[b]	–	163	163
Included in the group statement of comprehensive income			**(2,789)**
Regular contributions by employer	313	–	313
Deficit contributions by employer	274	–	274
Included in the group cash flow statement			**587**
Contributions by employees	8	(8)	–
Benefits paid	(2,315)	2,315	–
Foreign exchange	20	(34)	(14)
Other movements			**(14)**
At 31 March 2017	**51,112**	**(60,200)**	**(9,088)**
Service cost (including administration expenses and PPF levy)	(67)	(309)	(376)
Past service credit	–	17	17
Interest on pension deficit	1,201	(1,419)	(218)
Included in the group income statement			**(577)**
Return on plan assets above the amount included in the group income statement	10	–	10
Actuarial gain arising from changes in financial assumptions[a]	–	2,251	2,251
Actuarial loss arising from changes in demographic assumptions[a]	–	(221)	(221)
Actuarial gain arising from experience adjustments[b]	–	120	120
Included in the group statement of comprehensive income			**2,160**

Regular contributions by employer	264	–	264
Deficit contributions by employer	872	–	872
Included in the group cash flow statement			**1,136**
Contributions by employees	2	(2)	–
Benefits paid	(2,449)	2,449	–
Foreign exchange	11	(13)	(2)
Other movements			**(2)**
At 31 March 2018	**50,956**	**(57,327)**	**(6,371)**

a The actuarial gain or loss arises from changes in the assumptions used to value the defined benefit liabilities at the end of the year compared with the assumptions used at the start of the year. This includes both financial assumptions, which are based on market conditions at the year end, and demographic assumptions such as life expectancy.

b The actuarial loss or gain arising from experience adjustments on defined benefit liabilities represents the impact on the liabilities of differences between actual experience during the year compared with the assumptions made at the start of the year. Such differences might arise, for example, from members choosing different benefit options at retirement, actual salary increases being different from those assumed or actual benefit increases being different to the pension increase assumption.

The fair value of the plan assets should be disaggregated into classes that distinguish the nature and risks of those assets, subdividing each class of plan asset into those that have a quoted market price in an active market (as defined in IFRS 13, see Chapter 14) and those that do not. For example, and considering the level of detail of disclosure, aggregation and emphasis discussed at 15.2 above, an entity could distinguish between:

(a) cash and cash equivalents;

(b) equity instruments (segregated by industry type, company size, geography etc.);

(c) debt instruments (segregated by type of issuer, credit quality, geography etc.);

(d) real estate (segregated by geography etc.);

(e) derivatives (segregated by type of underlying risk in the contract, for example, interest rate contracts, foreign exchange contracts, equity contracts, credit contracts, longevity swaps etc.);

(f) investment funds (segregated by type of fund);

(g) asset-backed securities; and

(h) structured debt. *[IAS 19.142]*.

The fair value of an entity's own transferable financial instruments held as plan assets, and the fair value of plan assets that are property occupied by, or other assets used by, the entity should be disclosed. *[IAS 19.143]*.

The following extract from UBS Group AG illustrates how the plan assets may be disaggregated.

Extract 35.3: UBS Group AG (2018)

Total fair value of assets	10,493	5,279	15,772	100	11,304	5,084	16,388	100

An entity should disclose the significant actuarial assumptions used to determine the present value of the defined benefit obligation. Such disclosure should be in absolute terms (e.g. as an absolute percentage, and not just as a margin between different percentages and other variables). When an entity provides disclosures in total for a grouping of plans, it should provide such disclosures in the form of weighted averages or relatively narrow ranges. *[IAS 19.144]*.

15.2.3 Amount, timing and uncertainty of future cash flows

An entity should disclose:

(a) a sensitivity analysis for each significant actuarial assumption as of the end of the reporting period, showing how the defined benefit obligation would have been affected by changes in the relevant actuarial assumption that were reasonably possible at that date;

(b) the methods and assumptions used in preparing the sensitivity analyses required by (a) and the limitations of those methods; and

(c) changes from the previous period in the methods and assumptions used in preparing the sensitivity analyses, and the reasons for such changes. *[IAS 19.145]*.

A description should be given of any asset-liability matching strategies used by the plan or the entity, including the use of annuities and other techniques, such as longevity swaps, to manage risk. *[IAS 19.146]*.

To provide an indication of the effect of the defined benefit plan on the entity's future cash flows, an entity should disclose:

(a) a description of any funding arrangements and funding policies that affect future contributions;

(b) the expected contributions to the plan for the next annual reporting period; and

(c) information about the maturity profile of the defined benefit obligation. This will include the weighted average duration of the defined benefit obligation and may include other information about the distribution of the timing of benefit payments, such as a maturity analysis of the benefit payments. *[IAS 19.147]*.

The following extract from BT Group plc illustrates the maturity profile of the defined benefit obligation.

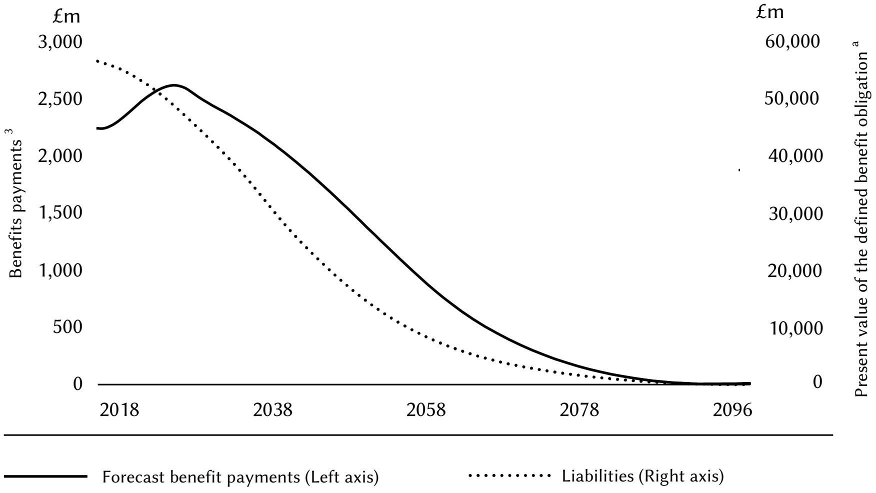
20 Retirement benefit plans [extract]

Forecast benefits payable by the BTPS at 31 March 2018 (unaudited)



[a] Based on accrued benefits to 30 June 2017.

15.2.4 Multi-employer plans

If an entity participates in a multi-employer defined benefit plan, different disclosures are required depending upon how the arrangement is accounted for. These are discussed below.

15.2.4.A Plans accounted for as defined benefit plans

If an entity participates in a multi-employer defined benefit plan and accounts for it as such, it should make all the required disclosures discussed above. In addition, it should disclose:

(a) a description of the funding arrangements, including the method used to determine the entity's rate of contributions and any minimum funding requirements;

(b) a description of the extent to which the entity can be liable to the plan for other entities' obligations under the terms and conditions of the multi-employer plan;

(c) a description of any agreed allocation of a deficit or surplus on:

  (i) wind-up of the plan; or

  (ii) the entity's withdrawal from the plan. *[IAS 19.148]*.

15.2.4.B Plans accounted for as defined contribution plans

If an entity accounts for a multi-employer defined benefit plan as if it were a defined contribution plan, it should disclose the following, in addition to the information required by 15.2.4.A above and instead of the disclosures normally required for defined benefits and discussed in 15.2 to 15.2.3 above:

(a) the fact that the plan is a defined benefit plan;

(b) the reason why sufficient information is not available to enable the entity to account for the plan as a defined benefit plan;

(c) the expected contributions to the plan for the next annual reporting period;

(d) information about any deficit or surplus in the plan that may affect the amount of future contributions, including the basis used to determine that deficit or surplus and the implications, if any, for the entity; and

(e) an indication of the level of participation of the entity in the plan compared with other participating entities. Examples of measures that might provide such an indication include the entity's proportion of the total contributions to the plan or the entity's proportion of the total number of active members, retired members, and former members entitled to benefits, if that information is available. *[IAS 19.148]*.

15.2.5 Defined benefit plans that share risks between entities under common control

If an entity participates in a defined benefit plan that shares risks between entities under common control, the entity should disclose:

(a) the contractual agreement or stated policy for charging the net defined benefit cost or the fact that there is no such policy; and

(b) the policy for determining the contribution to be paid by the entity. *[IAS 19.149]*.

Further disclosures are required depending upon how the arrangement is accounted for. These are discussed below.

15.2.5.A Plans accounted for as defined benefit plans

If an entity participates in a defined benefit plan that shares risks between entities under common control and accounts for an allocation of the net defined benefit cost, it should also disclose all the information about the plan as a whole set out in 15.2 to 15.2.3 above. *[IAS 19.149]*.

15.2.5.B Plans accounted for as defined contribution plans

If an entity participates in a defined benefit plan that shares risks between entities under common control and accounts for the net contribution payable for the period, it should also disclose the information set out below. *[IAS 19.149]*.

The standard requires disclosure of information that:

(a) explains the characteristics of its defined benefit plans and risks associated with them;

(b) identifies and explains the amounts in its financial statements arising from its defined benefit plans; and

(c) describes how its defined benefit plans may affect the amount, timing and uncertainty of the entity's future cash flows.

To meet the objectives above, the standard requires consideration of all the following:

(a) the level of detail necessary to satisfy the disclosure requirements;

(b) how much emphasis to place on each of the various requirements;

(c) how much aggregation or disaggregation to undertake; and

(d) whether users of financial statements need additional information to evaluate the quantitative information disclosed. *[IAS 19.136]*.

If the disclosures provided in accordance with the requirements in IAS 19 and other IFRSs are insufficient to meet the objectives above, an entity should disclose additional information necessary to meet those objectives. For example, an entity may present an analysis of the present value of the defined benefit obligation that distinguishes the nature, characteristics and risks of the obligation. Such a disclosure could distinguish:

(a) between amounts owing to active members, deferred members, and pensioners;

(b) between vested benefits and accrued but not vested benefits; and

(c) between conditional benefits, amounts attributable to future salary increases and other benefits. *[IAS 19.137]*.

IAS 19 requires disclosure of:

(a) information about the characteristics of its defined benefit plans, including:
  (i) the nature of the benefits provided by the plan (e.g. final salary defined benefit plan or contribution-based plan with guarantee);
  (ii) a description of the regulatory framework in which the plan operates, for example the level of any minimum funding requirements, and any effect of the regulatory framework on the plan, such as the asset ceiling; and
  (iii) a description of any other entity's responsibilities for the governance of the plan, for example responsibilities of trustees or of board members of the plan;

(b) a description of the risks to which the plan exposes the entity, focused on any unusual, entity-specific or plan-specific risks, and of any significant concentrations of risk. For example, if plan assets are invested primarily in one class of investments, e.g. property, the plan may expose the entity to a concentration of property market risk; and

(c) a description of any plan amendments, curtailments and settlements.

The fair value of the plan assets should be disaggregated into classes that distinguish the nature and risks of those assets, subdividing each class of plan asset into those that have a quoted market price in an active market (as defined in IFRS 13, discussed in Chapter 14) and those that do not. For example, and considering the level of detail of disclosure, aggregation and emphasis discussed at 15.2 above, an entity could distinguish between:

(a) cash and cash equivalents;

(b) equity instruments (segregated by industry type, company size, geography etc.);

(c) debt instruments (segregated by type of issuer, credit quality, geography etc.);

(d) real estate (segregated by geography etc.);

(e) derivatives (segregated by type of underlying risk in the contract, for example, interest rate contracts, foreign exchange contracts, equity contracts, credit contracts, longevity swaps etc.);

(f) investment funds (segregated by type of fund);

(g) asset-backed securities; and

(h) structured debt. *[IAS 19.142]*.

The fair value of the entity's own transferable financial instruments held as plan assets, and the fair value of plan assets that are property occupied by, or other assets used by, the entity should be disclosed. *[IAS 19.143]*.

An entity should disclose the significant actuarial assumptions used to determine the present value of the defined benefit obligation. Such disclosure should be in absolute terms (e.g. as an absolute percentage, and not just as a margin between different percentages and other variables). When an entity provides disclosures in total for a grouping of plans, it shall provide such disclosures in the form of weighted averages or relatively narrow ranges.

To provide an indication of the effect of the defined benefit plan on the entity's future cash flows, an entity should disclose:

(a) a description of any funding arrangements and funding policy that affect future contributions; and

(b) the expected contributions to the plan for the next annual reporting period.

The information described above and in 15.2.5.A above must be presented in the entity's own accounts. The rest of the information discussed in this section may be disclosed by cross-reference to disclosures in another group entity's financial statements if:

(a) that group entity's financial statements separately identify and disclose the information required about the plan; and

(b) that group entity's financial statements are available to users of the financial statements on the same terms as the financial statements of the entity and at the same time as, or earlier than, the financial statements of the entity. *[IAS 19.150]*.

15.2.6 Disclosure requirements in other IFRSs

IFRIC 14 does not introduce any new disclosure requirements. However, it suggests that any restrictions on the current realisability of the surplus or a description of the basis used to determine the amount of the economic benefit available (see 8.2 above), may require disclosure under the provisions in IAS 1 about key sources of estimation uncertainty. *[IFRIC 14.10]*. These requirements are discussed in Chapter 3 at 5.2.1.

Where required by IAS 24 an entity discloses information about:

(a) related party transactions with post-employment benefit plans; and

(b) post-employment benefits for key management personnel. *[IAS 19.151]*.

Where required by IAS 37 an entity discloses information about contingent liabilities arising from post-employment benefit obligations. *[IAS 19.152]*.

15.3 Other employee benefits

IAS 19 has no specific disclosure requirements in respect of other types of employee benefits within its scope (i.e. short-term employee benefits, long-term employee benefits other than post-employment benefits and termination benefits) but contains reminders that:

- IAS 24 requires disclosure of employee benefits for key management personnel (see Chapter 39); and
- IAS 1 requires disclosure of employee benefits expense. *[IAS 19.25, 158, 171]*.

16 POSSIBLE FUTURE DEVELOPMENTS

16.1 IASB activities

As noted at 1 above, the IASB published the current version of IAS 19 in June 2011 (with the latest amendments in February 2018). In February 2018, the IASB reviewed its research pipeline and decided to start research on pension benefits that depend on asset returns.[17] Its objective is to assess whether it is feasible to place a cap on asset returns used in estimates of asset-dependent benefits to avoid what is perceived by some to be an anomaly (i.e. benefits being projected based on expected returns that exceed the discount rate, resulting in a liability even though employees will never be paid any amount above the fair value of the reference assets). If the research establishes that this approach would not be feasible the staff expect to recommend no further work on pensions. At the time of writing the staff are currently developing illustrative examples to compare the outcome under the existing model with that under the capped ultimate adjustment model.

The Board has completed a research project into why different standards require different discount rates to be used with the project summary 'Discount rates in IFRS Standards' published in February 2019. The Board intends to use the research findings in existing projects which includes the Primary Financial Statements project. The Exposure Draft *General Presentation and Disclosures* which was developed as part of the Primary financial Statements Project was published in December 2019, with comments due by 30 September 2020. The Exposure Draft includes a proposal to replace IAS 1 with a new standard which would require net interest to be presented in a single category (financing) after the subtotal of profit before financing and income tax. IAS 19 currently defers to the requirements of IAS 1 for the presentation of the components of defined benefit cost which allows entities to present net interest on a net defined benefit liability in a variety of ways such as an operating expense or a finance cost (see 10 above).

In March 2018, the Board added the Targeted Standards-level Review of Disclosures project to its agenda. The project includes a review of some disclosures relating to present value measures and will cover IAS 19 disclosures. The Board is expecting to issue an exposure draft with amendments to the disclosure requirements in IAS 19 in the first half of 2021.

16.2 Interpretations Committee activities

16.2.1 The availability of a refund from a defined benefit plan

At 8.2.1 above we discuss how certain powers of pension fund trustees (to set investment policy, for example) may influence the recognition of a net defined benefit asset by reference to refunds.

The Interpretations Committee received a similar question and, in May 2014, published a description of its initial discussion which is summarised below.

The Interpretations Committee discussed whether an employer has an unconditional right to a refund of a surplus in the following circumstances:

- the trustee acts on behalf of the plan's members and is independent from the employer; and

- the trustee has discretion in the event of a surplus arising in the plan to make alternative use of that surplus by augmenting the benefits payable to members or by winding up the plan through purchase of annuities, or both.

The question discussed related to a plan that is closed to accrual of future benefits, such that there will be no future service costs, and so no economic benefit is available through a reduction in future contributions. The Interpretations Committee also noted that:

- the fact that an existing surplus at the balance sheet date could be decreased or extinguished by uncertain future events that are beyond the control of the entity is not relevant to the existence of the right to a refund;
- if the trustee can use a surplus by augmenting the benefits in the future, pursuant to the formal terms of a plan (or a constructive obligation that goes beyond those terms), this fact should be considered when the entity measures its defined benefit obligation; and
- the amount of surplus to be recognised could be zero, as a consequence of the measurement of the defined benefit obligation.[18]

The Interpretations Committee discussed the matter again at its meeting in July 2014 and considered the informal feedback received from the IASB members.

The Interpretations Committee noted the difficulty associated with assessing the consequences of the trustee's future actions and its effect on the entity's ability to estimate reliably the amount to be received. Consequently, a majority of Interpretations Committee members observed that no asset should be recognised in this circumstance.

However, some Interpretations Committee members were concerned about the consequences that this conclusion could have on the accounting for a minimum funding requirement and the consistency of this conclusion with the recognition and measurement requirements of IAS 19.

Consequently, the Interpretations Committee requested the staff to perform further analysis on the interaction of this tentative decision with the requirement to recognise an additional liability when a minimum funding requirement applies and the relationship with the general requirements of IAS 19.

In its meeting in September 2014, as a result of its detailed analysis, the Interpretations Committee noted that it believed that there would be no conflicts between its conclusion at the July 2014 meeting and the recognition and measurement requirements of IAS 19, as the application of the asset ceiling requirements is separate from the determination of a surplus (deficit) under IAS 19. It also noted that the conclusion should lead to consistent results when a minimum funding requirement exists.[19] The Interpretations Committee thought that the trustees' powers to buy annuities or make other investment decisions are different from their ability to use a surplus to enhance benefits (a pension promise). It also thought that an entity's ability to realise an economic benefit through a 'gradual settlement' is restricted if a trustee can decide at any time to make a full settlement (i.e. a plan wind-up), even though IFRIC 14 allows the assumption of a gradual settlement over time until all members have left the plan. *[IFRIC 14.14]*. The Committee proposed amendments to IFRIC 14 which are detailed below.

As a result of the discussions in the September 2014 meeting, the IASB published an exposure draft setting out proposed amendments to IFRIC 14 to require that, when an entity determines the availability of a refund from a defined benefit plan:

- The amount of the surplus that an entity recognises as an asset on the basis of a future refund should not include amounts that other parties (for example, the plan trustees) can use for other purposes without the entity's consent.
- An entity should not assume gradual settlement of the plan as the justification for the recognition of an asset, if other parties can wind up the plan without the entity's consent.
- Other parties' power to buy annuities as plan assets or make other investment decisions without changing the benefits for plan members does not affect the availability of a refund.

The exposure draft also proposed amending IFRIC 14 to confirm that when an entity determines the availability of a refund and a reduction in future contributions, the entity should take into account the statutory requirements that are substantively enacted, as well as the terms and conditions that are contractually agreed and any constructive obligations.

In addition, the exposure draft addressed the interaction between the asset ceiling and a past service cost or a gain or loss on settlement. It proposed amending IAS 19 to clarify that:

- the past service cost or gain or loss on settlement is measured and recognised in profit and loss in accordance with IAS 19; and
- changes in the effect of the asset ceiling are recognised in other comprehensive income, and are determined after the recognition of the past service cost or the gain or loss on settlement.

A summary of the feedback on the exposure draft was discussed by the Interpretations Committee in their July 2016 meeting, but no decisions were made.[20] The Interpretations Committee deliberated the proposed amendments at their September 2016 meeting, taking into account the feedback received. Further, at its April 2017 meeting the Board tentatively decided to finalise the proposed amendments to IFRIC 14, subject to drafting changes.[21] However, some stakeholders subsequently communicated that they believed that the proposed amendments could have a significant effect on some defined benefit plans, particularly those in the United Kingdom. The original proposed amendments to IFRIC 14 included a new paragraph 12A which stated that 'An entity does not have an unconditional right to a refund of a surplus on the basis of assuming the gradual settlement described in paragraph 11(b) if other parties (for example, the plan trustees) can wind up the plan without the entity's consent. Other parties do not have the power to wind up the plan without the entity's consent, if the power is dependent on the occurrence or non-occurrence of one or more uncertain future events not wholly within the other parties' control.' In response to respondents' concerns over the inconsistencies between this new paragraph and paragraphs 11(c) and 14 of IFRIC 14, the Board tentatively decided to replace the reference to other parties' powers to 'wind up the plan' in this new paragraph with other parties powers to 'settle in full the plan liabilities in a single event (i.e. as a plan wind-up)'. In the United Kingdom although trustees do not generally have the right to legally wind up a defined benefit plan without the entity's consent, they do generally have the right to settle plan liabilities for individual plan members without an entity's consent if they are 'reasonable'. Although 'reasonable' is not defined in the applicable legislation it is generally understood that this type of partial settlement can be initiated by trustees if plan members would not be worse off as a result of the settlement. It is also understood that trustees do not generally need to obtain consent from plan members to initiate a settlement. Accordingly, trustees could exercise the right to settle liabilities for all plan members in a single event. Entities with defined benefit plans have generally measured the economic benefit available as a refund on a gradual settlement basis applying paragraph 13 of IFRIC 14. Applying the proposed paragraph 12A of IFRIC 14 to United Kingdom defined benefit plans could result in a significantly lower net defined benefit asset in some situations (due to measuring the asset on a wind-up basis in a single event) and may also require the recognition of an additional liability for any portion of any minimum funding requirement that would not be recoverable due to the lower asset ceiling.[22] At its meeting in July 2017 the Board agreed that during drafting further clarification would be sought on the possible impact the amendments would have on schemes with certain characteristics (such as those in the United Kingdom). The staff's next step was to explore if schemes with characteristics similar to those found in United Kingdom schemes exist in other jurisdictions. There were no plans to change the scope of the project.

In its June 2018 meeting the IASB received an update on the Interpretations Committee's work on how an entity might assess the availability of a refund of a surplus. The Interpretations Committee believe it would be possible to develop a principles-based approach focusing on the distinction between when an entity assumes a gradual settlement of plan liabilities over time and when it assumes full settlement of plan liabilities. The Committee believe that such an approach would however be broader in scope than that of the existing proposed amendments to IFRIC 14 and it is possible that any amendments may need to be exposed for further comments. It was proposed that all possible changes to accounting for employee benefits be considered at the same time and that the IASB would be better placed to consider the direction of the IFRIC 14 project when the outcome of the IAS 19 research project (see 16 above) is known. In its February 2020 meeting, the IASB decided not to finalise the proposed amendments to IFRIC 14. It was recommended that the Board should consider referring to a project on IFRIC 14 in its Request for Information (RFI) as part of its 2020 Agenda Consultation. At the time of writing the RFI is due to be published in the first half of 2021.

Chapter 36 Operating segments

1 INTRODUCTION

1.1 Background

IFRS 8 – *Operating Segments* – was published in November 2006. The Standard has been mandatory since 2009. *[IFRS 8.35]*.

In Europe, the introduction of IFRS 8 was controversial. Opponents shared concerns expressed in the dissenting opinions of two IASB members that the lack of a defined measure of segment profit or loss and the absence of any requirement for that measure to be consistent with the attribution of assets to reportable segments would encourage the proliferation of non-GAAP measures that could mislead users. *[IFRS 8.D01-D04]*. These concerns were raised in the European Parliament together with questions about the governance of the IASB, as a result of which the process to endorse IFRS 8 in the European Union was not completed until November 2007, a year after the Standard had been published.

During this period, the IFRS Foundation announced enhancements to oversight and due process to include a requirement for the IASB to conduct 'a review of issues identified as contentious as part of the consultation process related to all new IFRSs (including IFRS 8), major amendments to IFRSs and major IFRIC interpretations'. Such a review would be performed after at least two full years of implementation and be completed within three years of the pronouncement's effective date.[1] IFRS 8 was the first standard subject to a post-implementation review, which was completed in 2013.

Based on the feedback to the post-implementation review, the IASB concluded that the benefits of applying the Standard were largely as expected and that overall the Standard achieved its objectives and has improved financial reporting. The IASB noted the concerns raised by some investors but concluded that they do not suggest significant failings in the Standard and therefore do not warrant a revision of the principles underlying IFRS 8.[2]

However, the IASB acknowledged that some issues could be considered for improvement and, in March 2017, issued an Exposure Draft proposing a limited number of improvements to the standard.[3]

In February 2019, the IASB issued a summary of the feedback received and the Board's response to it. Investors generally asked for more significant changes to IFRS 8 than those proposed in the ED. Preparers questioned whether all of the proposals would represent improvements to financial reporting. Other stakeholders were either asking for more clarification in some areas or questioned the benefits of the proposed amendments.

Based on the feedback received, the IASB decided not to proceed with these proposed amendments. Whilst it had initially decided proceeding with some of the proposals and to abandon the others, the Board concluded that, in aggregate, those remaining proposals would not result in sufficient improvements to justify the costs to stakeholders of implementing an amended standard.[4]

1.2 The main features of IFRS 8

IFRS 8 is a disclosure standard. It specifies the way an entity should report information about its operating segments in annual financial statements and, as a consequential amendment to IAS 34 – *Interim Financial Reporting*, requires an entity to report selected information about its operating segments in interim financial reports (see Chapter 41 at 4.4). It also sets out requirements for related disclosures about an entity's products and services, geographical areas and major customers. The disclosures required are discussed at 5 and 6 below and include:

- financial and descriptive information about the entity's reportable segments, which are operating segments above a certain size or (where specific criteria are met) aggregations of operating segments;
- segment revenues and a measure of profit or loss for each reportable segment, reconciled to the amounts disclosed in the entity's financial statements;
- a measure of segment assets, segment liabilities and particular income and expense items to the extent that such information is regularly provided to the chief operating decision maker of the entity, reconciled to the amounts disclosed in the entity's financial statements;
- unless the information is not available and the cost of its development would be excessive, information about the revenues derived from the entity's products and services (or groups of similar products and services), about the countries in which it earns revenues and holds assets, and about major customers, regardless of whether this information is used by management in making operating decisions; and
- descriptive information about the way that operating segments were determined, the products and services provided by the segments, differences between the measurements used in reporting segment information and those used in the entity's financial statements, and changes in the measurement of segment amounts from period to period.

The process of identifying operating segments for external reporting purposes begins with the information used by the entity's chief operating decision maker to assess performance and to make decisions about future allocations of resources. *[IFRS 8.5]*.

Entities applying IFRS 8 report on a single set of components according to the way that the business is sub-divided for management reporting purposes. *[IFRS 8.10]*.

If a component of an entity is managed as a separate segment, IFRS 8 requires it to be treated as such even if it sells exclusively or primarily to other components of the same entity. *[IFRS 8.5(a)]*.

IFRS 8 does not go so far as to require an entity to report all the information that is reviewed by the chief operating decision maker, recognising that such detail may not be useful to users of financial statements and could be cumbersome in its presentation. Instead it allows entities to apply certain criteria for aggregating components and to disclose information only for those segments that exceed certain quantitative criteria. *[IFRS 8.BC Appendix A 72]*.

Under IFRS 8, the amounts reported about identified segments are prepared according to the manner in which information is presented to the entity's chief operating decision maker. This can be different to the way that the entity applies its accounting policies used in the preparation of the financial statements under IFRSs.

IFRS 8 requires an entity to describe the factors used to identify the entity's reportable segments, including a description of the basis of organisation. This description would explain whether the organisation is structured according to products and services, geographical areas, regulatory environments or other factors and state whether operating segments have been aggregated for reporting purposes. In addition, the entity must describe the types of products and services from which each reportable segment derives its revenues and disclose the judgements made by management in aggregating operating segments into reportable segments. *[IFRS 8.22]*.

IFRS 8 specifies amounts which should be disclosed about each reportable segment, but only if those measures are included in the measure of profit or loss used by, or otherwise regularly provided to, the chief operating decision maker (see 5.2 below). These specified amounts include a requirement to report separately interest revenue and interest expense by segment (but only if those measures are included in the measure of profit or loss used, or otherwise regularly provided to the chief operating decision maker) unless a majority of the segment's revenues is derived from interest and performance is assessed primarily on the basis of net interest revenue. *[IFRS 8.23]*.

Certain 'entity-wide disclosures' are also required to be provided under IFRS 8, even if the entity has only one reportable segment *[IFRS 8.31]* (see 6 below). Entity-wide information is disclosed for the entity as a whole about its products and services, geographical areas and major customers, regardless of the way the entity is organised and the information presented to the chief operating decision maker. The amounts reported for this entity-wide information is based on the financial information used to produce the entity's financial statements. *[IFRS 8.32-34]*.

There is no 'competitive harm' exemption in IFRS 8 from the requirement to disclose segment information, or components of such information, for example on the grounds of commercial sensitivity, confidentiality or being otherwise detrimental to the entity's competitive position. *[IFRS 8.BC43-45]*.

These features are discussed in more detail in this chapter.

1.3 Disclosures required by IFRS 15

IFRS 15 – *Revenue from Contracts with Customers*, requires entities to disclose disaggregated revenue information to illustrate how the nature, amount, timing and uncertainty about revenue and cash flows are affected by economic factors. *[IFRS 15.114]*. If an entity applies IFRS 8, it is also required to disclose 'sufficient information' to explain the relationship between the disaggregated revenue information and revenue information that is disclosed for each reportable segment. *[IFRS 15.115]*. IFRS 15 also acknowledges that information meeting its requirements might have already been provided under another standard, in which case it is not required to be duplicated. *[IFRS 15.112]*.

Accordingly, many entities choose to combine the IFRS 15 disclosures of disaggregated revenue with their segment information in the notes to the financial statements. However, the segment disclosures required by IFRS 8 are made by reference to the information provided to the entity's chief operating decision maker and may not be sufficiently disaggregated to achieve the disclosure objectives of IFRS 15. In addition, the information used for segment reporting may be based on non-GAAP information rather than measured in accordance with IFRS 15. *[IFRS 15.BC340]*. As a result, entities can choose to provide more disaggregated 'entity-wide' information about revenues (see 6 below) in order to meet the additional requirements of IFRS 15.

The requirements of IFRS 15 in this regard are discussed at in Chapter 32 at 3.2.1.A.

1.4 Terms used in IFRS 8

The following terms are used in IFRS 8 with the meanings specified:

Term	Meaning
Operating segment	A component of an entity: (a) that engages in business activities from which it may earn revenues and incur expenses (including revenues and expenses relating to transactions with other components of the same entity); (b) whose operating results are regularly reviewed by the entity's chief operating decision maker to make decisions about resources to be allocated to the segment and assess its performance; and (c) for which discrete financial information is available. *[IFRS 8.5, IFRS 8 Appendix A]*.
Chief operating decision maker	The function of allocating resources to and assessing the performance of the operating segments of an entity. This is not necessarily a manager with a specific title, but can be an entity's chief executive officer, chief operating officer, a group of executive directors or others. *[IFRS 8.7]*.
Segment manager	The function of being directly accountable to and maintaining regular contact with the chief operating decision maker to discuss operating activities, financial results, forecasts, or plans for the segment. *[IFRS 8.9]*.

Reportable segment	An operating segment or a group of two or more operating segments determined to be eligible for aggregation in accordance with IFRS 8.12; and which exceeds the quantitative thresholds in IFRS 8.13. *[IFRS 8.11]*.
Aggregation criteria	Two or more operating segments may be aggregated into a single operating segment if aggregation is consistent with the core principle of IFRS 8, they have similar economic characteristics, such as long-term average gross margins, and are similar in each of the following respects: (a) the nature of the products and services; (b) the nature of the production processes; (c) the type or class of customer for their products and services; (d) the methods used to distribute their products or provide their services; (e) if applicable, the nature of the regulatory environment, for example, banking, insurance or public utilities. *[IFRS 8.12]*.
Quantitative thresholds	Information about an operating segment that meets any of the following criteria: (a) its reported revenue, including both sales to external customers and intersegment sales or transfers, is 10% or more of combined revenue, internal and external, of all operating segments; or (b) its reported profit or loss is, in absolute terms, 10% or more of the greater of, in absolute amount: (i) the combined profit of all operating segments that did not report a loss; and (ii) the combined reported loss of all operating segments that reported a loss; or (c) its assets are 10% or more of the combined assets of all operating segments. *[IFRS 8.13]*.

1.5 Transitional provisions

There are no special arrangements for entities applying IFRS 8 for the first time, with the Standard requiring comparative information to be restated. Only where the necessary information is both unavailable and incapable of being developed without excessive cost is an entity exempt from full restatement. *[IFRS 8.36]*. Accordingly, an entity should ensure that internal reporting systems can provide the information needed to meet the disclosure requirements of IFRS 8 for all periods presented in its financial statements.

2 OBJECTIVE AND SCOPE OF IFRS 8

2.1 Objective

The objective of IFRS 8 is expressed as a 'core principle', being that an entity shall disclose information to enable users of its financial statements to evaluate the nature and financial effects of the business activities in which it engages and the economic environments in which it operates. *[IFRS 8.1]*.

2.2 Scope of IFRS 8

IFRS 8 applies to both the separate or individual financial statements of an entity and the consolidated financial statements of a group with a parent:

(a) whose debt or equity instruments are traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local and regional markets); or

(b) that files, or is in the process of filing, its financial statements with a securities commission or other regulatory organisation for the purpose of issuing any class of instruments in a public market. *[IFRS 8.2]*.

The above test is applied to the parent entity alone. *[IFRS 8.2(b)]*. Therefore, IFRS 8 does not apply to a group headed by a parent that has no listed financial instruments, even if the group includes a subsidiary that has any of its equity or debt instruments traded in a public market. The scope of IAS 33 – *Earnings per Share* – is similarly defined. *[IFRS 8.BC23]*.

Of course, a subsidiary with publicly traded debt or equity instruments would be required to provide segment information under IFRS 8 in its own financial statements from its perspective as a reporting entity.

2.2.1 The meaning of 'traded in a public market'

The Standard describes a 'public market' as including a domestic or foreign stock exchange or an over-the-counter market, including local and regional markets, *[IFRS 8.2]*, but does not define what would make some markets 'public' and others not.

In our view, a market is 'public' when buyers and sellers (market participants) can transact with one another (directly; through agents; or in a secondary market) at a price determined in that market. A public market does not exist when the buyers and sellers can transact only with the entity itself (or an agent acting on its behalf). The requirement for an entity to list its securities on a stock exchange is not the sole factor determining whether the entity is in the scope of IFRS 8. Its securities must be traded in a public market meeting the criteria noted above.

Example 36.1: The meaning of 'public market' in the context of a fund

Many investment funds are listed on a public stock exchange for informational purposes, in particular to facilitate the valuation of portfolios by investors or because it is a requirement for the fund to be listed on a public stock exchange to make it eligible for investment by entities that are required to invest only in listed securities. However, in spite of such a listing, subscriptions and redemptions are handled by a fund administrator or a transfer agent (acting on behalf of the fund) and no transactions are undertaken on the public stock exchange. In addition, the prices for those transactions are determined by the fund agreement, such as on the basis of the fund's Net Asset Value, rather than the price quoted on the public stock exchange and determined by supply and demand.

In our view the debt or equity instruments of such entities are not traded in a public market and so the entity would not fall within the scope of IFRS 8. Nevertheless, regulators can mandate that funds provide segment information, or funds can voluntarily disclose segment information. In such cases, the funds need to comply with the requirements of IFRS 8.

Such 'public markets' would include exchange markets, dealer markets, brokered markets, and principal-to-principal markets as described in IFRS 13 – *Fair Value Measurement* – and listed in that Standard as examples of markets in which fair value inputs might be observable (see Chapter 14 at 15.1). *[IFRS 13.B34]*.

2.2.2 Consolidated financial statements presented with those of the parent

When both the consolidated financial statements and the parent's separate or individual financial statements are contained in the same financial report, segment information is only required in the consolidated financial statements. *[IFRS 8.4]*.

2.2.3 Entities providing segment information on a voluntary basis

Entities for which IFRS 8 is not mandatory might still want to provide information about their business activities, for example about sales by segment, without triggering the need to comply fully with the Standard. The Board concluded that this would be acceptable, provided that such disclosure is not referred to as 'segment information'. *[IFRS 8.BC22]*. Consequently, entities giving information about segments on a voluntary basis cannot describe that information as 'segment information' unless it has been prepared in compliance with IFRS 8. *[IFRS 8.3]*.

3 IDENTIFYING A SINGLE SET OF OPERATING SEGMENTS

IFRS 8 adopts a 'bottom up' approach to determining the level of detail required for segment reporting in the notes to the financial statements. It requires the entity's revenue earning activities to be divided into operating segments (based on the same components used by management to run the business) and only allows that information to be aggregated for reporting purposes if specific criteria are met. This process can involve considerable judgement, as it may not always be immediately clear what activities are operating segments for the purposes of the Standard or which layer of the entity's organisational structure represents the level at which those activities are managed. This is particularly the case when management information is presented in a number of different ways (for example by product, by geographical market and by legal entity) or where management structures distinguish operational, strategic and oversight responsibilities.

Notwithstanding such difficulties, the requirement is to identify a single set of components as constituting the entity's operating segments. *[IFRS 8.8]*.

The process for determining operating segments is important not only to entities applying IFRS 8 for external reporting purposes, but also to entities implementing the requirements of IAS 36 – *Impairment of Assets* – for testing goodwill for impairment. As such, the way that operating segments are defined and determined under IFRS 8 can affect the financial statements of entities to which the disclosure requirements in IFRS 8 do not apply, such as those without traded equity or debt. This is because the Standard on impairment, applicable to all entities, states that goodwill cannot be allocated to a group of cash-generating units (CGUs) that is larger than an operating segment before aggregation (as determined below). *[IAS 36.80(b)]*. See Chapter 20 at 8.1.4.

3.1 Definition of an operating segment

An operating segment is defined as a component of an entity:

(a) that engages in business activities from which it may earn revenues and incur expenses (including revenues and expenses relating to transactions with other components of the same entity);

(b) whose operating results are regularly reviewed by the entity's chief operating decision maker to make decisions about resources to be allocated to the segment and assess its performance; and

(c) for which discrete financial information is available. *[IFRS 8.5].*

This means that the determination of an entity's operating segments starts with the smallest components of the business for which information about profit is presented for use by the entity's chief operating decision maker (sometimes referred to as 'CODM').

3.1.1 Revenue earning business activities

A significant feature of an operating segment is the potential for revenue generation rather than actually earning revenues in the reporting period. Accordingly, a start-up operation can be treated as an operating segment while it has yet to earn revenues. *[IFRS 8.5].*

However, not every part of an entity is necessarily an operating segment. For example, a corporate headquarters or a functional department (such as a centralised data processing centre) that either does not earn revenues or for which revenues are only incidental to the activities of the entity would not be an operating segment for the purposes of IFRS 8. Similarly, an entity's post-employment benefit plans would not be regarded as operating segments. *[IFRS 8.6].*

3.1.2 'Chief operating decision maker' and 'segment manager'

Arguably the most important judgements made in implementing IFRS 8 relate to the identification of the entity's chief operating decision maker. The nature of what is ultimately disclosed in the financial statements about operating segments and the level of detail (or segmentation) required is directly related to the information regularly provided to the chief operating decision maker.

References in the standard to 'chief operating decision maker' are to the function of allocating resources and assessing performance of the operating segments and not to a manager with a specific title. Often the chief operating decision maker of an entity is its chief executive officer or chief operating officer (i.e. an individual), but the term could refer equally to a group of executive directors or others charged with that role. *[IFRS 8.7].*

In Extract 36.1 below, the Go-Ahead Group identifies its Group Chief Executive as the chief operating decision maker:

Extract 36.1: The Go-Ahead Group plc (2019)

Notes to the consolidated financial statements [extract]

3. **Segmental analysis** [extract]

The information reported to the Group Chief Executive in his capacity as chief operating decision maker does not include an analysis of assets and liabilities and accordingly IFRS 8 does not require this information to be presented.

The determination of chief operating decision maker will not be the same for all entities applying IFRS 8 and will depend upon the particular facts and circumstances applying to each entity, including the entity's governance structure. However, in stating that the term could apply to a group of executive directors or others, *[IFRS 8.7]*, the Standard is clear that the function of CODM is an executive role. The IFRS Interpretations Committee confirmed this view in 2011. While it observed that in practice the functions of CODM are sometimes carried out by multiple persons and that all such persons involved in those activities would be part of the CODM group, the Committee noted that the CODM would not normally include non-executive directors.[5] For example, an entity may have a single board of executive and non-executive directors which reviews the performance of individual business units, makes decisions about the operating budgets for those businesses and reviews significant applications for investment. In that case, the full board could be identified as the chief operating decision maker. However, if the entity also has a sub-committee of executive directors or another grouping of key management personnel (sometimes referred to as an 'operational board'), this smaller group of executives would be identified as the chief operating decision maker.

Essentially, the chief operating decision maker is found at the most senior executive decision-making level of an organisation and as such should be distinguished from higher levels of management fulfilling primarily an oversight or approval role and who, to reflect their non-executive function, are provided information at a more aggregated level as a matter of course. For example, in some jurisdictions, supervisory bodies may be part of an entity's governance structure and be entrusted with significant oversight responsibilities. This role may give the supervisory body significant veto rights and rights of approval. However, that supervision will not typically represent the level of decision-making implicit in the notion of the CODM.

In the extract below, Roche Group identifies as the CODM its Corporate Executive Committee, a group of senior executives which is headed by the Chief Executive Officer and is appointed by and reports to the Board of Directors.

Extract 36.2: Roche Holding Ltd (2019)

Notes to the Roche Group Consolidated Financial Statements [extract]

34. Significant accounting policies [extract]

Segment reporting [extract]

For the purpose of segment reporting the Group's Corporate Executive Committee (CEC) is considered to be the Group's Chief Operating Decision Maker. The determination of the Group's operating segments is based on the organisation units for which information is reported to the CEC on a regular basis.

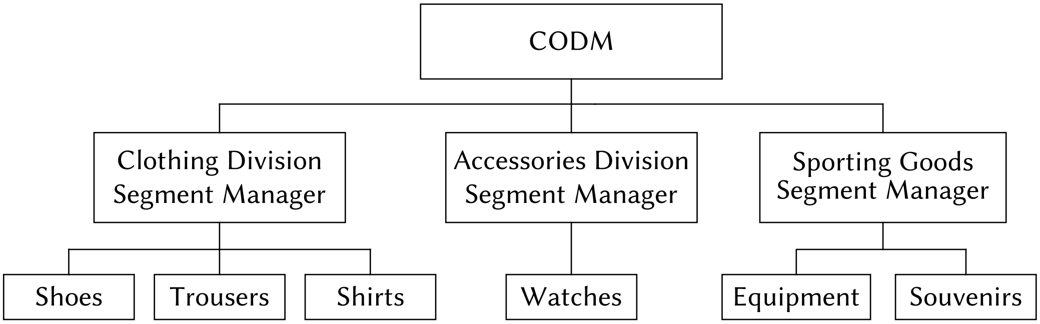
Another important distinction to be made is between chief operating decision maker and the function of 'segment manager'. The segment manager is accountable to and maintains regular contact with the chief operating decision maker to discuss operating activities, financial results, forecasts or plans for the segment. The chief operating decision maker may also fulfil the role of segment manager for some operating segments and a single segment manager may be responsible for more than one operating segment. *[IFRS 8.9]*. For example, if the CODM is a group of executives, members of that group may fulfil the role of segment manager for certain components of the entity.

Considerations of how components of the entity are managed are relevant to the identification of an entity's operating segments and not to how they might be reported in the financial statements. Accordingly, separate operating segments which otherwise meet the definition at 3.1 above are not aggregated into single reportable operating segments simply because they have a common segment manager. The Standard is clear that such segments are only aggregated into reportable operating segments if they exhibit similar long-term economic characteristics and are similar in respect of the qualitative criteria set out at 3.2.1 below. *[IFRS 8.12]*. In addition, because the oversight role of the CODM is separate from the operational role of the segment manager, it is possible that an entity could regard an investee accounted for by the equity method as an operating segment (see 3.1.5 below).

In practice, judgement is required to determine whether the component(s) for which a segment manager is held responsible represents one or more operating segments. For example, if targets are set by the CODM for the entire area of one segment manager's responsibility and the remuneration of that segment manager is based on the achievement of those targets, on an aggregated basis, this could support a determination that the area of responsibility is one operating segment in the absence of other evidence indicating that the CODM reviews the results of these components separately. Equally, whilst IFRS 8 states that segment managers will generally exist, their existence is an important indicator for identifying operating segments, but not a necessary condition. The key determinant is based on the activity of the CODM with respect to the internally reported results of that component.

A common situation in practice is that detailed financial information is provided or available to the chief operating decision maker on a regular basis about various levels of management and operational activity within an entity. In these circumstances, the interplay between the three criteria at 3.1 above becomes very important, as the existence of more detailed internal reporting could otherwise lead to a determination that there are more operating segments. If the three criteria apply to more than one set of components of an entity, but there is only one set that has segment managers, generally the set of components with segment managers constitutes the operating segments. *[IFRS 8.8]*.

Example 36.2: Identifying operating segments – CODM and segment manager



CODM
Clothing Division Segment Manager
Accessories Division Segment Manager
Sporting Goods Segment Manager
Shoes
Trousers
Shirts
Watches
Equipment
Souvenirs

The diagram above sets out the internal reporting structure of Entity A. The CODM receives financial information about the entity's operations, the most detailed of which (including revenue and operating profit) relates to the six business units (Shoes, Trousers, Shirts, Watches, Equipment and Souvenirs). However, these units do not have their own segment manager. Instead, the six business units are grouped into three divisions (Clothing, Accessories and Sporting Goods), each of which has a divisional manager who reports directly to the CODM. The three divisions report financial information to the CODM who uses it to assess performance and allocate resources.

Marketing strategies are determined by the CODM for each division, and each divisional manager is responsible for their implementation at the business unit level. Also, quarterly financial information is presented to the Board of directors and investors at the division level, which is consistent with the level at which the CODM makes decisions. In addition, the company determines the following:

- Budgets and forecasts are prepared at the division level, and the CODM reviews budget-to-actual variances at that level on a monthly basis;
- The divisional managers are compensated in accordance with the company's bonus plan, which sets targets for each division.

In this case, the entity decides that the operating segments as defined in IFRS 8 comprise the three divisions as opposed to the six business units, because only the divisions have segment managers.

Proper application of the requirements of IFRS 8 requires a clear understanding of what information is given to the chief operating decision maker and how the CODM uses that information, in conjunction with the segment managers. In the above example, the fact that the CODM receives detailed financial information about activities below the divisional level could raise doubts about the determination that the divisions represent the entity's operating segments, rather than the business units. In these circumstances, entities would be required to demonstrate that:

- the more detailed information is not used by the CODM to assess performance and allocate resources;
- segment managers operate only at the divisional level and are not, in effect, managers for each of the business units in their division. As noted above, components otherwise meeting the characteristics of an operating segment under IFRS 8 are not combined simply because they share a segment manager.

It might be evident from the records of the discussions between segment managers and the CODM that results are monitored at divisional rather than at business unit level. It might equally be clear from the records of board meetings that more detailed information is not referred to by the CODM in its deliberations. However, there is evidence that when regulators and other enforcement agencies assess the quality of an entity's compliance with IFRS 8, they adopt the presumption that the CODM uses whatever detailed information is provided to him/her on a regular basis for decision-making and assessment purposes.

3.1.3 Availability of discrete financial information

As noted above, a component of an entity can only be regarded as an operating segment if discrete financial information is available about that component. *[IFRS 8.5(c)]*. This requirement relates solely to the existence of discrete information that allows the chief operating decision maker to make decisions about the allocation of resources and to assess the performance of that component.

Accordingly, a component of an entity is still regarded as an operating segment if the only information available relates to the profitability of that component. Such information would be sufficient for the chief operating decision maker to review its operating results, assess performance and make decisions about resource allocation. *[IFRS 8.5(b)]*. The financial information is not rendered useless by the lack of, for example, a separate statement of financial position or a separate statement of cash flows for that component.

However, it would be unlikely that a component of an entity could be regarded as an operating segment solely because the chief operating decision maker receives information about revenue from that component. Without a measure of the component's operating results it would be difficult to make meaningful assessments of the effect of allocating more or less resource to that activity. As such, information on revenue alone would have limited value in decision making. Therefore, the search for an entity's operating segments starts with the smallest components of the business for which a measure of profitability is provided to the entity's CODM.

3.1.4 When a single set of components is not immediately apparent

For many entities, the search for operating segments is concluded after applying the three criteria listed at 3.1 above.

However, in cases where a single set of operating segments cannot be identified clearly by applying the above criteria, for example in an entity where its business activities are reported internally and assessed in a variety of ways, IFRS 8 states that other factors should be considered, including the nature of the business activities of each component, the existence of a manager responsible for it, and the information presented to the board of directors. *[IFRS 8.8]*. Therefore, if an entity's activities are reported internally in a number of different ways, each with their own set of business components as defined above, but there is only one set to which segment managers are assigned, then that will comprise the operating segments to report in the financial statements for IFRS 8 purposes. *[IFRS 8.9]*. For example, if an entity's board of directors manages its business using information on revenues and costs analysed both by product grouping as well as by geographical market, but the management structure operates only on geographical lines, then the financial statements would include segmental information on a geographical basis.

A single set of operating segments must be identified, even where two or more sets of components of an entity are managed in a matrix structure, for example where financial information is available and performance is assessed and segment managers assigned not only on the basis of product and service lines worldwide but also by geographical area irrespective of products and service lines. In that situation the choice of a single set of components is a matter of judgement, made by reference to the core principle of the Standard as set out at 2.1 above. *[IFRS 8.10]*. This requirement is different to FASB ASC Topic 280 and ED 8, which proposed that in such circumstances operating segments be drawn up on product and service lines.[6] The IASB agreed with respondents to the exposure draft that a default position mandating the use of components based on products and services was inconsistent with a management approach founded on what is important to the chief operating decision maker. *[IFRS 8.BC27]*.

3.1.5 An equity accounted investment can be an operating segment

The definition of an operating segment focuses on the review of its operating results by the entity's chief operating decision maker and the assessment of its performance and the allocation of resources to it by the CODM. *[IFRS 8.5(b)]*. This raises the question of whether the reporting entity needs to have control over the activities conducted in what otherwise would meet the definition of an operating segment, or whether it is sufficient that the CODM reviews its results and this review influences decisions about investment in those activities. In our view, control over the activities in which the entity is investing is not a requirement.

The core principle of IFRS 8 requires the disclosure of information relating to the business activities in which an entity engages and the economic environments in which it operates. *[IFRS 8.1]*. No restriction is imposed according to the manner of that engagement, just the way in which the CODM makes decisions about allocating resources and assesses its performance.

For example, an equity method investee (i.e. associate or joint venture), could be considered an operating segment if it meets the criteria in IFRS 8. The CODM may regularly review the operating results and performance of an equity method investee for the purposes of making additional investments or advances, evaluating financial performance or evaluating whether to retain its investment. The CODM is not required to be responsible for making decisions at the investee operating level that affect the investee's operations and performance in order for it to be identified as an operating segment. Further, the definition of an operating segment does not require that the revenue generating activities of the investee are included in the entity's revenue as reported in the IFRS financial statements. Segment performance could be measured by reference to the amounts included in the entity's IFRS financial statements or equally by reference to the financial information prepared by the investee itself. Any difference between the measures used by the CODM and the accounting treatment under IFRS would be reported as a reconciling item in the entity's disclosures under IFRS 8 (see 5.6 below).

This view is consistent with the disclosure requirements of IFRS 8, which require the entity's share of the profits and losses of equity accounted associates and joint ventures and the amount of investment in equity accounted investees to be presented, if those amounts are included in the measures reviewed by the CODM of segment profit or loss and segment assets respectively (see 5.3 and 5.4 below). *[IFRS 8.23(g), IFRS 8.24(a)]*.

In 2019, HOCHTIEF Aktiengesellschaft changed its segment reporting to present a significant equity-method investee, which used to be presented in 'Corporate Headquarters' as a separate reportable segment:

Extract 36.3: HOCHTIEF Aktiengesellschaft (2019)

Notes to the Consolidated Financial Statements [extract]

36. Segment reporting [extract]

HOCHTIEF's structure reflects the operating focus of the business as well as the Group's presence in key national and international regions and markets. Segmental reporting in the HOCHTIEF Group is based on the Group's divisional operations. The breakdown mirrors the Group's internal reporting systems.

The Group's reportable segments (divisions) are as follows:

HOCHTIEF Americas encompasses the construction management and construction activities of operational units in the USA and Canada;

HOCHTIEF Asia Pacific pools the construction activities, contract mining and services in the Asia-Pacific region;

HOCHTIEF Europe brings together the core business in Europe as well as selected other regions and designs, develops, builds, operates, and manages real estate and infrastructure.

Albertis Investment comprises the investment in Spanish toll road operator Albertis Infraestructuras S.A., which is accounted for as a separate segment from 2019. It was previously presented under Corporate and the prior-year segment information has been restated accordingly.

Corporate comprises Corporate Headquarters, other activities not assignable to the separately listed divisions, including management of financial resources and insurance activities, plus consolidation effects. [...]

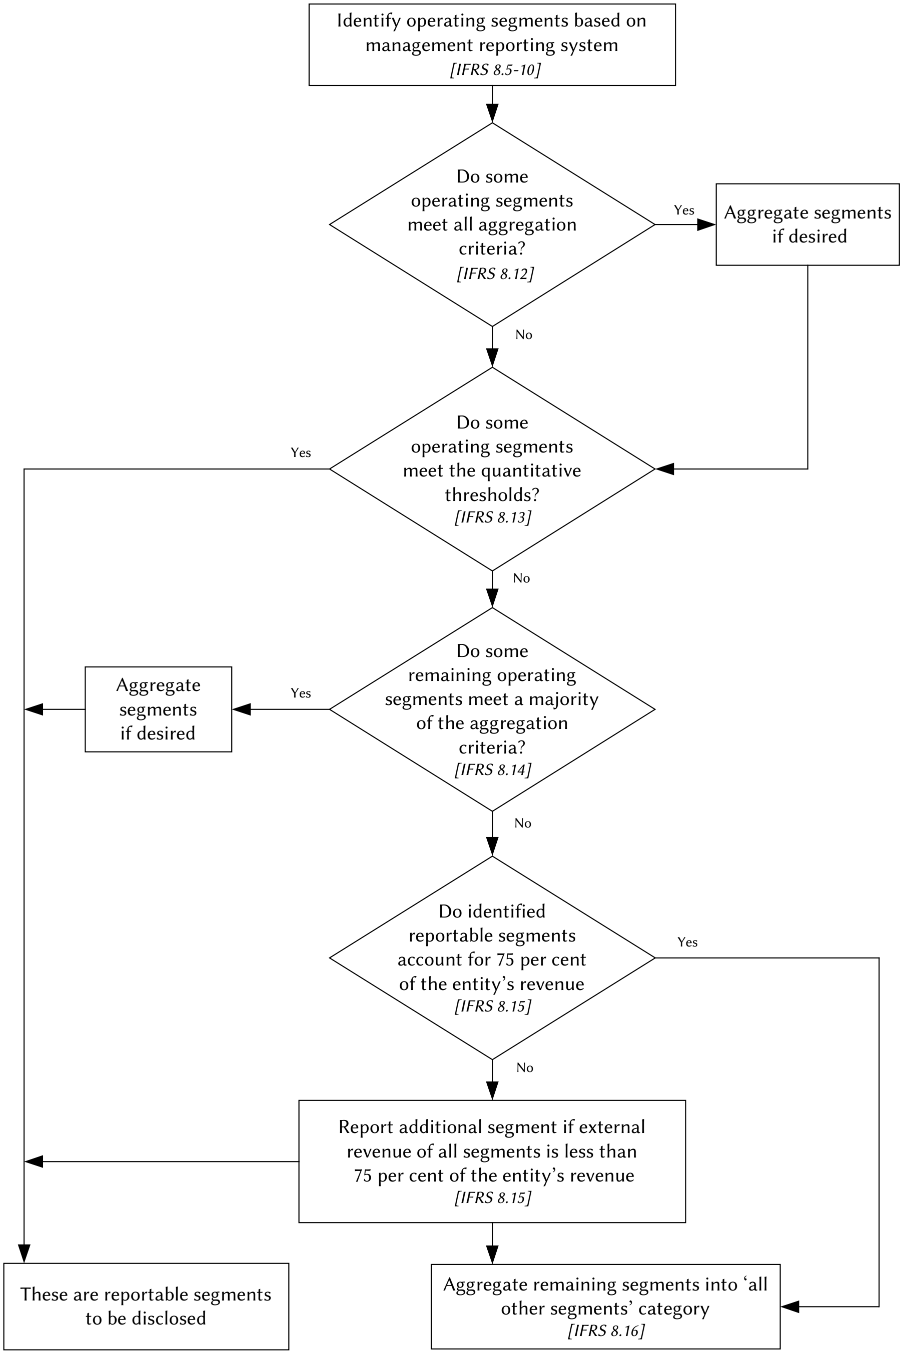
Divisions	EBITDA		Ordinary depreciation/ amortization		Share of profits and losses of equity-method associates and joint ventures	
	2019	2018	**2019**	2018	**2019**	2018
(EUR thousand)		(restated)		(restated)		
HOCHTIEF Americas	397,749	374,660	80,061	57,821	77,518	70,802
HOCHTIEF Asia Pacific	1,334,204	1,209,490	570,715	457,597	41,514	36,990
HOCHTIEF Europe	97,270	116,425	47,082	42,461	26,169	63,558
Albertis Investment	122,355	84,284	–	–	122,355	84,284
Corporate	(58,732)	(98,622)	2,900	2,481	14,730	(23,792)
HOCHTIEF Group	**1,892,846**	**1,686,237**	**700,758**	**560,360**	**282,286**	**231,842**

3.2 Identifying externally reportable segments

Having identified a single set of internal operating segments, the Standard describes how reportable segments are determined. As a minimum an entity must separately disclose information on reportable segments above a certain size (see 3.2.2 below). In addition, a previously identified reportable segment continues to be disclosed separately in the current period if management judges it to be of continuing significance, even if it no longer satisfies the quantitative thresholds. *[IFRS 8.17]*.

Thereafter, an entity is only compelled to give information on other segments (either individually or in certain circumstances on a combined basis) if the unallocated element is too large (see 3.2.4 below).

The implementation guidance to IFRS 8 includes a diagram illustrating how to apply the main provisions of the Standard for identifying reportable segments, which is reproduced below:



Identify operating segments based on management reporting system *[IFRS 8.5-10]*
Do some operating segments meet all aggregation criteria? *[IFRS 8.12]*
Yes
Aggregate segments if desired
No
Do some operating segments meet the quantitative thresholds? *[IFRS 8.13]*
Yes
No
Do some remaining operating segments meet a majority of the aggregation criteria? *[IFRS 8.14]*
Yes
Aggregate segments if desired
No
Do identified reportable segments account for 75 per cent of the entity's revenue *[IFRS 8.15]*
Yes
No
Report additional segment if external revenue of all segments is less than 75 per cent of the entity's revenue *[IFRS 8.15]*
These are reportable segments to be disclosed
Aggregate remaining segments into 'all other segments' category *[IFRS 8.16]*

As indicated in the implementation guidance, the diagram is a visual supplement to the IFRS. It should not be interpreted as altering or adding to any requirements of the IFRS nor should it be regarded as a substitute for its requirements. *[IFRS 8.IG7]*.

IFRS 8 does not permit the omission of segment information when management believe that its disclosure is commercially sensitive or potentially detrimental to the entity's competitive position. If the criteria for separate disclosure described at 3.2.2 and 3.2.4 below are met, an entity is compelled to give information on that operating segment in the financial statements. The IASB considered both a general 'competitive harm' exemption and a 'comply or explain' basis for disclosure and rejected both. *[IFRS 8.BC43-45]*.

3.2.1 Aggregation criteria – aggregating internally reported operating segments into single reportable operating segments

Under IFRS 8, an entity is required to both determine its operating segments and report operating segment financial information in accordance with the management approach. However, reporting separate information about every operating segment that the CODM reviews separately may not enhance the financial statement user's understanding of the business, particularly when two or more of the operating segments are so similar that they 'can be expected to have the same future prospects.' *[IFRS 8.BC Appendix A 73]*.

As such, regardless of their size, two or more operating segments are permitted to be aggregated if they have similar economic characteristics (demonstrated, for example, by similar long-term average gross margins) and are similar in each of the following respects:

(a) the nature of the products and services;

(b) the nature of the production processes;

(c) the type or class of customer for the products and services;

(d) the methods used to distribute the products or provide the services; and

(e) if applicable, the nature of the regulatory environment. *[IFRS 8.12]*.

At this stage in the process only segments which are similar in *all* the above respects can be aggregated into single reportable segments, which can require judgment. Further aggregation can only be achieved for segments which do not merit separate disclosure by virtue of their size (see 3.2.2 below).

It is important that entities do not overlook the requirement for operating segments to exhibit similar economic characteristics before considering the other factors allowing aggregation. *[IFRS 8.BC30]*. The fact that certain operating segments have been selected by management as a separately reportable component of activities in the business would suggest that there are good commercial reasons why their performance is monitored separately by the CODM and, therefore, might usefully be reported separately to users of the financial statements. Only if those components exhibit similar economic characteristics does their aggregation not compromise the entity's ability to achieve the core principle of IFRS 8, to disclose information that is useful to users of its financial statements. *[IFRS 8.BC32]*.

There is a certain presumption inherent in any standard on segment reporting that investors would prefer information on a more disaggregated basis. As a result, it may be questioned whether it is consistent with the objective and basic principles of IFRS 8 for a company to report just one reportable segment or a limited number of reportable segments, especially if such reportable segments are inconsistent with an entity's basic organisational structure. Companies that choose to aggregate operating segments should be prepared to explain why an operating segment is important enough to be individually reported to the CODM, but similar enough to other segments to be aggregated when reported to investors.

In assessing whether the aggregation criteria are met, it is important to note that the aggregation criteria are tests, not indicators, of similarity between operating segments. The operating segments must be similar in each (i.e. all) of the following areas for aggregation to be permitted:

(a) *The nature of the products and services.* Similar products or services generally will have similar purposes or end uses. Thus, they may be subject to similar types and degrees of risk and similar opportunities for growth. We believe that it often will be appropriate to evaluate the similarity of products or services based on the range of activities of the organisation, as illustrated in the following example:

Example 36.3: Similar products and services

Conglomerate Inc., a highly diversified company, manufactures a variety of consumer products, provides financial services and has a construction business. It determines that all of its consumer products activities are similar in the context of its business and aggregates them for reporting purposes, reporting its financial services and construction business results separately. By contrast, ConsumerPro Limited, an entity that only sells a variety of consumer products, determines that, in the context of its business activities, not all of its consumer products are similar in nature and report its results separately for each major product group.

(b) *The nature of the production processes.* A similar production process might be demonstrated by the sharing of common or interchangeable production facilities, equipment, labour force or service group and by using similar raw materials in the production process. Likewise, similarity in the nature and type of labour or amounts of capital required also may be indicative of a similar production process. The nature of the production process of two different products may be similar, even if the products do not function similarly. Consider the following example:

Example 36.4: Similar production processes

Assume that Life Co., a life sciences company manufactures various pharmaceutical products for commercial sale. These products include cold medicines and diet pills. Each product is manufactured through the same production process, even though the products have different applications. Both products consist of various chemical compounds that are mixed together in batches to create the end product. Both products undergo quality control testing in order to confirm the efficacy of the product. Both products also use the same manufacturing equipment for parts of the production process. Thus, Life Co. concludes that for the purposes of the segment aggregation criteria, the production processes are similar, despite the differences in the applications of the end products.

(c) *The type or class of customer for their products and services.* Factors to consider in evaluating whether the type or class of customer are similar include: (1) the region or geography in which the products and services are marketed; (2) the methods used to market the products or services, including the use of a common or interchangeable sales force; and (3) the nature or type of customer including the industries in which the customers may operate. Entities should carefully consider whether this criterion has been met when the products or services of one operating segment are targeted to a different customer base or constitute a material revenue stream. Consider the following example:

Example 36.5: Type and class of customer

Market Co., a diversified clothing manufacturer has two operating segments, Retail and Wholesale. Retail primarily markets its products to consumers through electronic and print advertising. In contrast, Wholesale principally markets its products through a network of sales representatives who call upon the distributors to purchase the products. In considering the type or class of customer, Market Co. concludes that the type and class of customer are not similar for the two operating segments based upon the distinction between retail and wholesale as well as the primary marketing methods for its products. As such, aggregation of the two operating segments would not be permitted.

(d) *The methods used to distribute their products or provide their services.* The determination of whether two methods of distribution are similar will depend on the structure of a particular company. Consider the following example:

Example 36.6: Retail outlets and internet distribution

Software Co., a software retailer, has two operating segments: Retail, which distributes its products through retail outlets, and Internet, which distributes its products through a website on the internet. In evaluating whether these operating segments can be aggregated, Software Co., might conclude that the methods to distribute its products are not similar because Retail and Internet distribute products through different distribution channels.

(e) *If applicable, the nature of the regulatory environment,* for example, banking, insurance, or public utilities. Entities that operate within certain industries may be subject to regulatory requirements that are promulgated by a government agency. Sometimes two operating segments may produce the same product through the same production process, but because of differences in the class of customer and the regulatory environment, the operating segments should not be aggregated. For example, it may not be appropriate for an entity to aggregate an operating segment that produces a product under government contracts together with an operating segment that produces the same product for commercial purposes.

Some entities are comprised of operating segments that operate within different regulatory environments. We believe that the nature of the regulatory environments in which two or more operating segments operate can be regarded as similar, even if the regulatory bodies are not the same.

The following example illustrates how the management of an entity has interpreted these requirements. However, any judgments to be made will be specific to the entity and the environment in which it operates and in different circumstances some of the characteristics considered will be relatively more or less relevant than others.

Example 36.7: Aggregating internally reported operating segments with similar characteristics into a single reportable operating segment

In the information presented to the executive directors, a single-product company has identified seven components of its business that are internally reported operating segments, Africa, Australia and Pacific, France, Germany, Italy, UK and Ireland and USA. The company dominates its markets in Australia and Pacific and in Germany and consequently enjoys superior operating profits. Its other markets are fragmented, competition is greater and therefore historic and expected margins are lower. Can any segments be aggregated for external reporting purposes?

Management has considered each of the criteria set out in paragraph 12 of IFRS 8 to determine whether the economic characteristics of these separate operating segments are similar, including competitive and operating risks, currency risks and political conditions, as well as current performance and future trading prospects. In these circumstances, management decided that it would not combine operating segments with different underlying currency risks and regulatory environments. That left only France, Germany and Italy as candidates for combination, since they all operate within the Euro zone. However, Germany has not been included in a larger reportable segment because, whilst similar in all other ways, its long-term financial performance is not expected to be comparable to France and Italy, as evidenced by its superior operating profits. On this basis, management decided to aggregate only its operations in France and Italy for external segment reporting purposes.

As can be seen in the above example, operating segments trading in clearly different economic environments (for example with unrelated functional currencies) should not be aggregated for segment reporting purposes (unless they are so small as to fall within the 'all other segments' category discussed at 3.2.4 below). The Standard states that the existence of similar long-term average gross margins would be a positive indicator. *[IFRS 8.12]*. This implies that operating segments should not be aggregated if their long-term average gross margins are significantly different, even if they are similar in all the other respects noted above. While IFRS 8 includes long-term gross margin as an example of similar economic characteristics, if the CODM uses a different measure of profit or loss (e.g. EBITDA) to assess performance and allocate resources to each operating segment, that measure of profit or loss should also be considered when assessing whether operating segments possess similar economic characteristics. In addition, if other economic measures are provided to the CODM, the similarities of those economic measures should also be considered. For example, if the CODM uses sales metrics, return on investment, or other standard industry measures, those metrics may also be relevant in determining economic similarity.

In assessing whether long-term average gross margins (or the appropriate measure of operating performance used by the CODM to assess performance and allocate resources, such as EBITDA) of operating segments are sufficiently similar, companies should look to past and present performance as indicators that segments are expected to have the same future prospects. In other words, if operating segments do not currently have similar gross margins and sales trends but are expected to have similar long-term average gross margins and sales trends, it may be appropriate to aggregate the two operating segments (provided all other criteria are met). Conversely, if operating segments happen to have similar gross margins or sales trends in a given year but it is not expected that the similar gross margins or sales trends will continue in the future, the operating segments should not be aggregated for the current-year segment disclosures just because current economic measures happen to be similar. It follows that operating segments that have been profitable over the longer term should not be combined with segments that over the longer term have been consistently loss-making.

IFRS 8 does not define the term 'similar' and does not provide guidance about what is similar for aggregation purposes. As the above discussion indicates, the determination of whether two or more operating segments are similar requires judgment and is dependent on the individual facts and circumstances.

In a response to a submission in 2011, the Interpretations Committee had acknowledged that IFRS 8 could usefully include further guidance on the meaning of 'similar economic characteristics' and the criteria for identifying similar segments listed in (a) to (e) above.[7] In a move to improve the Standard in this area, the IASB decided to enhance the disclosures on the aggregation of segments but not to add any further guidance at that time (see 5.1.1 below). More recently, the IASB intended to include further examples of similar economic characteristics a result of its Post-implementation Review. However, it has now decided not to amend IFRS 8 (see 1.1 above).

3.2.2 Quantitative thresholds – operating segments which are reportable because of their size

IFRS 8 includes a number of quantitative measures for determining whether information on the identified operating segments should be reported separately. Accordingly, an operating segment (or combination of segments meeting the qualitative criteria for aggregation described at 3.2.1 above) merits separate disclosure if it meets any of the following thresholds:

(a) its reported revenue (including both sales to external customers and intersegment sales or transfers) is 10% or more of the combined revenue (internal and external) of all operating segments; or

(b) its reported profit or loss is, in absolute terms, 10% or more of the greater of:

  (i) the combined profit of all operating segments that did not report a loss; or

  (ii) the combined loss of all operating segments that reported a loss; or

(c) its assets are 10% or more of the combined assets of all operating segments. *[IFRS 8.13]*.

The definition of an operating segment includes a component of an entity earning revenues and incurring expenses relating to transactions with other components of the same entity. *[IFRS 8.5]*. Therefore an entity would have to report separately information on an operating segment that exceeds the above criteria, even if that segment earns a majority of its revenues from transactions with other components of the same entity.

Example 36.8: Identifying reportable segments using the quantitative thresholds

An entity divides its business into 9 operating units for internal reporting purposes and presents information to the Chief Operating Decision Maker as follows:

	Unit 1	Unit 2	Unit 3	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8	Unit 9	Total
	£000	£000	£000	£000	£000	£000	£000	£000	£000	£000
Revenue:										
External	34,000	3,000	15,000	30,000	35,000	35,000	77,500	55,500	25,000	310,000
Internal	35,000	34,000	12,500	2,200	–	1,500	7,800	2,300	–	95,300
Total	69,000	37,000	27,500	32,200	35,000	36,500	85,300	57,800	25,000	405,300
Profit/(loss)	21,500	24,500	(4,500)	2,300	10,000	7,500	3,500	35,000	(21,250)	78,550
Assets	12,250	77,800	25,000	24,000	40,000	7,730	145,000	55,000	4,300	391,080

Assuming that none are eligible for aggregation under the qualitative aggregation criteria set out at 3.2.1 above, which units are required to be reported as operating segments in the entity's financial statements?

Applying the above quantitative thresholds, Units 1, 2, 5, 7, 8 and 9 should be identified as reportable segments, as follows:

- A Unit whose internal and external revenue is 10% or more of the total revenue of all segments is a reportable segment. On this criterion Unit 1 (17%), Unit 7 (21%) and Unit 8 (14%) are reportable segments.
- A Unit is a reportable segment if its profit or loss, in absolute terms, is 10% or more of the greater of the combined profits of all profitable segments or the combined losses of all segments in loss. The combined profit of all profitable segments is £104.3m, which is greater than the total of £25.75m for segments in loss. On this basis, Unit 1 (21%), Unit 2 (23%), Unit 8 (34%) and the loss-making Unit 9 (20%) are reportable segments.
- A Unit is also a reportable segment if the measure of assets reported to the chief operating decision maker is 10% or more of the total reported measure of assets of all segments. On this test, Unit 5 (10%) joins the list of reportable segments, with Unit 2 (20%), Unit 7 (37%) and Unit 8 (14%) having been already identified under other criteria.

In Example 36.8 above, units 1, 2, 5, 7, 8 and 9 are identified as reportable segments under IFRS 8 by virtue of their size. No further aggregation of large segments such as these would be possible unless all of the qualitative criteria set out at 3.2.1 above are met.

Even if an internally reported operating segment falls below all of the quantitative thresholds, it may still be considered as reportable, and separately disclosed, if management believes information about the segment would be useful to users of the financial statements. *[IFRS 8.13]*. Where information about segment assets is not disclosed under IFRS 8 because it is not provided regularly to the CODM, *[IFRS 8.23]*, it would be appropriate to ignore criterion (c) above for determining the reportable segments.

3.2.3 Combining small operating segments into a larger reportable segment

Operating segments which individually fall below the size criteria may be combined with other small operating segments into a single larger reporting segment provided that:

(a) the operating segments being combined have similar economic characteristics; and

(b) they share a majority (rather than all) of the criteria listed at 3.2.1 above. *[IFRS 8.14]*.

For the avoidance of doubt, if an entity proposes to combine a small operating segment with one that exceeds any of the quantitative thresholds, they must share all of the criteria described at 3.2.1 above. The requirement that combining segments must demonstrate similar economic characteristics applies to combinations of both larger and smaller operating segments into reportable segments, without exception.

3.2.4 'All other segments'

At this stage the entity has been divided into a single set of components, based on the elements reported to the chief operating decision maker. Components (operating segments) have been combined where permitted by the Standard and the entity has identified a number of individual operating segments or groups of operating segments that are required to be disclosed separately in the financial statements because each exceeds the quantitative thresholds for a reportable segment. The entity may then be left with a number of operating segments which have not been identified as being reportable, as well as other business activities that are not an operating segment or part of an operating segment.

Information about other business activities and operating segments that are not reportable should be combined and disclosed in a separate category for 'all other segments'. *[IFRS 8.16]*. However, this residual category cannot be too large. If total external revenue for the operating segments already reported separately is less than 75% of the entity's revenue, the entity should identify additional operating segments for external reporting until the 75% target is reached. In this situation segments would have to be reported separately even if they fall below the quantitative thresholds described at 3.2.2 above and are not otherwise regarded as being significant. *[IFRS 8.15]*.

There is no requirement to identify as a reportable segment the next largest internally reported operating segment. The choice of additional reporting segments is aimed simply to reach the 75% threshold, as illustrated below.

Example 36.9: Reaching the threshold of 75% of external revenue

In Example 36.8 above, Units 1, 2, 5, 7, 8 and 9 were identified as reportable segments. The total external revenue attributable to these reportable segments is £230m. This is only 74.2% of total external revenues and therefore less than the required 75% of total external revenue of £310m.

The entity is therefore required to identify additional segments as reportable segments, even if they do not meet the quantitative thresholds at 3.2.2 above. Entities that have numerous operating segments often will have latitude in selecting operating segments to meet the 75% test. In this case, Unit 3, with external revenue of £15m (4.8%), Unit 4's external revenue of £30m (9.7%) and Unit 6's external revenue of £35m (11.3%) would each take the total above the required 75%. The entity can choose to present any of these as a reportable segment, leaving the others to be combined to form the item for 'all other segments'.

The 'all other segments' category must be presented separately from other reconciling items. *[IFRS 8.16]*. This raises the question whether headquarters, treasury and similar central functions (sometimes referred to as 'corporate items') should be included in 'all other segments' or in the reconciliation. In practice, the headquarters activities and its related accounting effects will not always be allocated to the operating segments for internal reporting purposes. The description of 'all other segments' refers to 'other business activities and operating segments'. *[IFRS 8.16]*. It could be argued that central functions are not business activities, but support functions which should be part of the reconciliation. On the other hand, they could be regarded as incidental business activities. There is no guidance to suggest that either presentation is ruled out by the Standard.

3.2.5 A 'practical limit' for the number of reported operating segments

IFRS 8 states that there may be a practical limit to the number of separately reportable segments beyond which segment information may become too detailed. Without prescribing such a limit, it suggests that an entity expecting to disclose more than 10 separate reportable segments should consider whether the practical limit has been reached. *[IFRS 8.19]*.

3.2.6 Restatement of segments reported in comparative periods

When an operating segment is identified for the first time as a reportable segment in accordance with the thresholds at 3.2.2 above, the prior period segment data that is presented for comparative purposes should be restated to reflect the newly reportable segment regardless of whether it would have satisfied the quantitative thresholds in the prior period. Only if the necessary information is not available and the cost to develop it would be excessive would prior periods not be restated. *[IFRS 8.18]*.

4 MEASUREMENT

For an entity that does not present IFRS-compliant financial information to its chief operating decision maker, the measurement regime in IFRS 8 means that the values disclosed for segment revenue, profit or loss, and (when reported) assets or liabilities could be very different to those reported elsewhere in the financial statements. For example, management might include gains on sale of property, plant and equipment in its measure of segment revenue but not be permitted to do so in its financial statements. *[IAS 16.68]*.

There is no requirement in IFRS 8 for segment information to be prepared in conformity with the accounting policies used to present the financial statements of the consolidated group or entity. IFRS 8 requires amounts reported to be the same as those measures used by the chief operating decision maker for determining resource allocation and for assessing performance. *[IFRS 8.25]*. This requirement is interpreted strictly. For example, unless adjustments and eliminations made in preparing the financial statements are reflected in the information used by the chief operating decision maker, an entity is prohibited from restating reported segment profit or loss for those adjustments and eliminations. In addition, the Standard prohibits any further allocation of revenues, expenses and gains and losses in determining segment profit or loss unless that measure is used by the chief operating decision maker. *[IFRS 8.25]*. IFRS 8 does not require symmetry between the revenues and expenses included in segment result and the assets and liabilities allocated to segments; it simply requires disclosure of the nature and effect of any asymmetrical allocations to reportable segments, for example when depreciation expense is reflected in segment profit or loss, but the related depreciable assets are not allocated to that segment. *[IFRS 8.27(f)]*. Only those assets and liabilities taken into account by the chief operating decision maker will be included in assets and liabilities reported for that segment. *[IFRS 8.25]*.

The amounts presented for segment revenue, profit or loss, assets and liabilities need bear no relationship to the values reported elsewhere in the financial statements, if the only measure of each that is used by the chief operating decision maker is not prepared in accordance with the entity's accounting policies or even under IFRS. *[IFRS 8.26]*. However, there is a constraint on this otherwise 'free-for-all', since in those cases where a number of measures of segment profit or loss, assets or liabilities are used by the chief operating decision maker, an entity is required to select for its segment disclosures the measurements that are most consistent with those used in preparing the financial statements. *[IFRS 8.26]*. A key judgement that can significantly affect the segment disclosures reported in the financial statements arises when an entity seeks to distinguish information used by the chief operating decision maker for determining resource allocation and for assessing performance from other information and supporting detail which is regularly provided. Whether, for example, it is appropriate to ignore IFRS-compliant measures provided to the chief operating decision maker on the basis that they are not used for determining resource allocation and for assessing performance depends on the facts and circumstances supporting that assertion. Nevertheless, it might be appropriate to apply a rebuttable presumption that management effort is not normally wasted in providing the chief operating decision maker with information that is not used.

Instead of defining the elements of segment information to be disclosed and requiring that they be prepared under the same policies and principles applied in producing the financial statements, IFRS 8 requires an entity to explain how it has measured segment profit or loss and segment assets and liabilities for each reportable segment and to reconcile this to the information reported under IFRS. *[IFRS 8.27-28]*. These requirements are discussed at 5.5 and 5.6 below.

5 INFORMATION TO BE DISCLOSED ABOUT REPORTABLE SEGMENTS

IFRS 8 establishes a general principle for an entity to disclose information to enable users of its financial statements to evaluate the nature and financial effects of the types of business activities in which the entity engages and the economic environments in which it operates. *[IFRS 8.20]*. This principle is met by disclosing the following information for each period for which a statement of comprehensive income or separate income statement is presented:

(a) general information on segments identified for reporting;

(b) reported segment profit or loss, including information about specified revenues and expenses included in reported segment profit or loss, segment assets and segment liabilities (if reported to the CODM) and the basis of measurement; and

(c) reconciliations of the totals of segment revenues, reported segment profit or loss, segment assets, segment liabilities and other material segment items to the corresponding entity amounts in the financial statements. *[IFRS 8.21]*.

Reconciliations of amounts reported in the statement of financial position for reportable segments are required as at each date for which a statement of financial position is presented. *[IFRS 8.21]*.

These requirements are addressed in more detail below and the information described therein should be given separately for each segment determined to be reportable using the process set out at 3.2 above. *[IFRS 8.11]*.

As discussed at 3.1.2 above, the identification of the chief operating decision maker can be a critical judgment in applying IFRS 8 because of its potential impact on what information is considered for disclosure. However, there is no explicit requirement in the Standard to disclose the CODM. When in 2011, the Interpretations Committee and the IASB considered a request to amend the Standard to require disclosure, they decided to defer this issue until the completion of the Post-implementation Review of IFRS 8 rather than through an interpretation or annual improvement.[8] As noted at 1.1 above, the Board issued an Exposure Draft in March 2017. This ED proposed that entities disclose the title and description of the role of the individual or group which is identified as the CODM.[9] In our view, while the proposed disclosure requirement was not finally adopted, it would be good practice in any event to disclose the individual or group identified as CODM (see examples at 3.1.2 above).

5.1 General information about reportable segments

The factors used to identify reportable segments should be described. This would include an explanation of the entity's basis of organisation, for example whether management has chosen to organise the entity by different products and services, by geographical area, by regulatory environment or by applying a combination of factors.

The description would also indicate whether operating segments have been aggregated. The general information on reportable segments would include a description of the types of products and services from which each reportable segment derives its revenues. *[IFRS 8.22]*. The disclosures should also include a description of the sources of the revenue classified in the 'all other segments' category. *[IFRS 8.16]*.

In Extract 36.4 below, Daimler describes how its activities have been segmented into its principal business activities and specific product lines.

Extract 36.4: Daimler AG (2019)

NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]

34. **Segment reporting** [extract]

Reportable segments

The reportable segments of the Group are Mercedes-Benz Cars, Daimler Trucks, Mercedes-Benz Vans, Daimler Buses and Daimler Mobility (formerly Daimler Financial Services). The segments are largely organized and managed separately, according to nature of products and services provided, brands, distribution channels and profile of customers.

The vehicle segments develop and manufacture passenger cars, trucks, vans and buses. The Mercedes-Benz Cars segment comprises premium vehicles of the Mercedes-Benz brand including the brands Mercedes-AMG and Mercedes-Maybach, and small cars under the smart brand, as well as the brand Mercedes me. Electric products are marketed under the EQ brand. Daimler Trucks distributes its trucks under the brand names Mercedes-Benz, Freightliner, Western Star, FUSO, Western Star and BharatBenz. Furthermore, buses under the brands Thomas Built Buses and FUSO are included in the Daimler Trucks range of products. The vans of the Mercedes-Benz Vans segment are primarily sold under the brand name Mercedes-Benz and also under the Freightliner brand. Daimler Buses sells completely built-up buses under the brand names Mercedes-Benz and Setra. In addition, Daimler Buses produces and sells bus chassis. The vehicle segments also sell related spare parts and accessories.

The Daimler Mobility segment supports the sales of the Group's vehicle segments worldwide. Its product portfolio primarily comprises tailored financing and leasing packages for end-customers and dealers, brokering of automotive insurance and banking services. The segment also provides services such as fleet management in Europe, which primarily takes place through the Athlon brand. Furthermore, Daimler Mobility is active in the area of innovative mobility services.

5.1.1 Disclosure of how operating segments are aggregated

IFRS 8 requires disclosure of the judgements made by management in applying the aggregation criteria in the Standard. This includes a brief description of the operating segments that have been aggregated in this way and the economic indicators that were considered in determining that the aggregated operating segments share similar economic characteristics. *[IFRS 8.22(aa)]*. The aggregation criteria are discussed at 3.2.1 above.

In Extract 36.5 below, Vodafone describes the composition of its two reportable segments, Europe and Rest of the World. The narrative explains the basis for aggregating countries into those reportable segments.

> *Extract 36.5: Vodafone Group Plc (2020)*
>
> **Notes to the consolidated financial statements** [extract]
>
> 2. **Revenue disaggregation and segmental analysis** [extract]
>
> **Segmental analysis** [extract]
>
> The Group's operating segments are established on the basis of those components of the Group that are evaluated regularly by the chief operating decision maker in deciding how to allocate resources and in assessing performance. The Group has determined the chief operating decision maker to be its Chief Executive Officer. The Group has a single group of similar services and products, being the supply of communications services and products. Revenue is attributed to a country or region based on the location of the Group company reporting the revenue. Transactions between operating segments are charged at arm's-length prices.
>
> Segment information is primarily provided on the basis of geographic areas, with the exception of Vodacom which encompasses South Africa and certain other smaller African markets, being the basis on which the Group manages its worldwide interests.
>
> The aggregation of operating segments into the Europe and Rest of the World regions reflects, in the opinion of management, the similar economic characteristics within each of those regions as well as the similar products and services offered and supplied, classes of customers and the regulatory environment. In the case of the Europe region this largely reflects membership of the European Union, while for the Rest of the World region this largely includes emerging and developing economies that are in the process of rapid growth and industrialisation.
>
> Certain financial information is provided separately within the Europe region for Germany, Italy, the UK and Spain, and within the Rest of the World region for Vodacom, as these operating segments are individually material for the Group. [...]

5.2 A measure of segment profit or loss, total assets and total liabilities

For each reportable segment, an entity is required to disclose a measure of profit or loss for each segment. An entity is also required to disclose a measure of total assets and total liabilities for each reportable segment, but only if such amounts are regularly provided to the chief operating decision maker. *[IFRS 8.23]*. This 'measure' means segment profit or loss and segment assets and liabilities as defined in the information used by the chief operating decision maker.

5.2.1 Other measures of segment performance

Entities typically use not only a measure of profit or loss, but also a combination of different financial and non-financial key performance indicators to assess performance of their operating segments and allocate resources to them. Examples include key measures based on capital invested like return on capital employed (ROCE), free cash flow or orders on hand. Since these are not measures of profit or loss, they would not need to be disclosed. However, the Standard does not prohibit their disclosure.

Siemens includes measures of new orders and free cash flow in its segment information as shown in Extract 36.6 below.

5.3 Disclosure of other elements of revenue, income and expense

The following items should also be disclosed about each reportable segment if the specified amounts are included in the measure of segment profit or loss reviewed by the chief operating decision maker or are otherwise regularly provided in respect of those segments to the chief operating decision maker (even if not included in that measure of segment profit or loss):

(a) revenues from external customers;
(b) revenues from transactions with other operating segments of the same entity;
(c) interest revenue;
(d) interest expense;
(e) depreciation and amortisation;
(f) material items of income and expense disclosed in accordance with paragraph 97 of IAS 1 – *Presentation of Financial Statements*;
(g) the entity's interest in the profit or loss of associates and joint ventures accounted for by the equity method;
(h) income tax expense or income; and
(i) material non-cash items other than depreciation and amortisation. *[IFRS 8.23]*.

Interest revenue should be reported separately from interest expense for each reportable segment unless a majority of the segment's revenues are from interest and the chief operating decision maker relies primarily on net interest revenue to assess the performance of the segment and make decisions on the allocation of resources to it. In that case, the entity can report net interest revenue or expense for the segment provided that it discloses it has done so. *[IFRS 8.23]*.

Where the measure of segment profit or loss is determined after deducting depreciation and amortisation, these amounts will have to be disclosed separately for purposes of segment reporting, even if they are not separately reported to the CODM.

It can be seen that whilst IFRS 8 indicates the line items of income or expense or other information that might merit disclosure by segment, what an entity actually reports in its financial statements is determined by the line items used by the chief operating decision maker to define segment profit or loss and segment assets or liabilities, together with the other information otherwise regularly provided to the chief operating decision maker. *[IFRS 8.23-24]*. This means that different entities (even those with very similar activities) will make different disclosures, depending on what information is provided to the chief operating decision maker. Indeed, what is disclosed by one entity for each of its reportable segments might vary because, for example, the result of one segment is determined after deducting interest whilst that of other segments is drawn before interest; or because the information provided to the chief operating decision maker about one segment includes equity-accounted associates but for other segments does not. As such the disclosures made by an entity are tailored according to exactly what appears in the information presented to the chief operating decision maker.

Equinor ASA provides segment disclosures based on its internal management reporting, with reportable segments determined based on differences in the nature of their operations, products and services, as follows:

Balance sheet information						
Equity accounted investments	3	321	90	1,028	0	1,442
Non-current segment assets	33,795	37,558	5,124	4,214	0	80,691
Non-current assets, not allocated to segments						11,152
Total non-current assets						93,285

5.4 Additional disclosures relating to segment assets

If any of the following items are either included in the measure of segment assets reviewed by the chief operating decision maker or otherwise regularly provided in respect of those segments (whether included in segment assets or not), an entity should also disclose for each segment:

(a) the investment in equity-accounted associates and joint ventures; and

(b) total expenditures for additions to non-current assets other than financial instruments, deferred tax assets, post-employment benefit assets and rights arising under insurance contracts. *[IFRS 8.24]*.

5.5 Explanation of the measurements used in segment reporting

As noted at 4 above, instead of prescribing how an entity should calculate the amounts reported in its segmental disclosures, IFRS 8 requires an entity to explain how its measures of segment profit or loss, segment assets and segment liabilities have been determined. As a minimum, the following information is required:

(a) the basis of accounting for any transactions between reportable segments;

(b) if not apparent from the required reconciliations (see 5.6 below), the nature of any differences between the measurement of total reported segment profit or loss and the entity's profit or loss before income taxes and discontinued operations;

(c) the nature of any differences between the measurements of total reported segment assets and the entity's assets, if not apparent from the required reconciliations;

(d) the nature of any differences between the measurements of total reported segment liabilities and the entity's liabilities, if not apparent from the required reconciliations;

(e) the nature of any changes from prior periods in the measurement methods used to determine segment profit or loss, including the financial effect, if any, of those changes; and

(f) the nature and effect of any asymmetrical allocations to reportable segments, such as where depreciation is included in segment profit but the related property, plant and equipment is not included in segment assets. *[IFRS 8.27]*.

The kind of disclosures in (b), (c) and (d) above that are necessary for an understanding of the reported segment information could relate to the accounting policies used, including policies for the allocation of centrally incurred costs in arriving at segment profit or loss and for the allocation of jointly used assets and liabilities in determining segment assets and segment liabilities. *[IFRS 8.27]*. Other examples might include the use of previous local GAAP numbers, where internal reporting does not reflect the entity's move to IFRS, or the use of budgeted figures, for example when applying budgeted or constant foreign currency rates.

In Extract 36.8 below, Daimler confirms that segment information is prepared using the same accounting policies as the IFRS financial statements, describes how 'EBIT' is the measure of segment profit or loss and explains how segment assets and liabilities are determined.

Extract 36.8: Daimler AG (2019)

NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]

34. Segment reporting [extract]

Internal management and reporting structure [extract]

The internal management and reporting structure at the Daimler Group principally is based on the accounting policies that are described in ◇ Note 1 in the summary of significant accounting policies according to IFRS.

The measure of the Group's profit or loss used by Daimler's management and reporting structure is referred to as "EBIT." EBIT comprises gross profit, selling and general administrative expenses, research and non-capitalized development costs, other operating income/expense, and the profit/loss on equity-method investments, net, as well as other financial income/expense, net. Although amortization of capitalized borrowing costs is included in cost of sales, it is not included in EBIT. The performance measure used by the Group's internal management and reporting structure for the automotive segments is return on sales.

Intersegment revenue is generally recorded at values that approximate market terms.

Segment assets principally comprise all assets. The vehicle segments' assets exclude income tax assets, assets from defined benefit pension plans and other post-employment benefit plans, and certain financial assets (including liquidity). Segment liabilities principally comprise all liabilities. The vehicle segments' liabilities exclude income tax liabilities, liabilities from defined benefit pension plans and other post-employment benefit plans, and certain financial liabilities (including financing liabilities).

Daimler Mobility's performance is measured on the basis of return on equity, which is the usual procedure in the banking business.

The residual value risks associated with the Group's operating leases and finance lease receivables are generally borne by the vehicle segments that manufactured the leased equipment. Risk sharing is based on agreements between the respective vehicle segments and Daimler Mobility; the terms vary by vehicle segment and geographic region.

Non-current assets consist of intangible assets, property, plant and equipment and equipment on operating leases.

[...]

In its 2019 financial statements, HOCHTIEF provided an explanation of the basis of accounting for transactions between reportable segments.

> *Extract 36.9: HOCHTIEF Aktiengesellschaft (2019)*

>
> **36. Segment reporting** [extract]
>
> HOCHTIEF's structure reflects the operating focus of the business as well as the Group's presence in key national and international regions and markets. Segmental reporting in the HOCHTIEF Group is based on the Group's divisional operations. The breakdown mirrors the Group's internal reporting systems.
>
> The Group's reportable segments (divisions) are as follows:
>
> [...]
>
> **Explanatory notes to the segmental data** [extract]
>
> Intersegment sales represent revenue generated between divisions. They are transacted on an arm's length basis. External sales mainly comprise performance obligations recognized under the percentage of completion method in the mainstream construction business, construction management, and contract mining. The sum of external sales and intersegment sales adds up to total sales revenue for each division.

5.6 Reconciliations

Reconciliations are required of all the following:

(a) the total of revenue from reportable segments to the entity's revenue;

(b) the total profit or loss for reportable segments to the entity's profit or loss before income taxes and discontinued operations. Where items such as income taxes have been allocated to arrive at segment profit or loss, the reconciliation can be made to the entity's profit or loss after those items;

(c) if segment assets are reported (see 5.2 above), the total of the reportable segments' assets to the entity's assets;

(d) if segment liabilities are reported (see 5.2 above), the total of reportable segments' liabilities to the entity's liabilities; and

(e) for every other material item of information the entity chooses to give in its segment information, the total of each item from all reportable segments to the corresponding amount for the entity. *[IFRS 8.28]*.

In each of the above reconciliations an entity must separately identify and describe all material reconciling items. For example, when reconciling segment profit or loss to the entity's profit or loss before income taxes and discontinued operations, each material adjustment arising from differences in accounting policies would have to be separately identified and described. *[IFRS 8.28]*. In addition, IFRS 8 requires information about the 'all other segments' category to be shown separately from other reconciling items. *[IFRS 8.16]*.

In its 2019 financial statements, National Australia Bank evaluated the performance of operating segments on the basis of cash earnings. This post-tax measure of the profit or loss of reportable segments is reconciled to the consolidated financial statements as follows:

Extract 36.10: National Australia Bank Limited (2019)

Net profit/ (loss) attributable to the owners of NAB	2,837	1,347	1,485	1,009	(1,880)	4,798
Reportable segment assets	200,799	230,916	295,042	84,307	36,060	847,124

(1) Includes customer-related remediation and capitalised software change. Refer Note 3 Net interest income, Note 4 Other income and Note 5 Operating expenses for further details. It also includes Group eliminations

5.7 Restatement of previously reported information

Entities may need to change their organisation to respond to their business needs. This may have an impact on the entity's segment reporting. IFRS 8 provides explicit guidance if such a change in the organisation changes the composition of its reportable segments. However, it does not explicitly address any changes that impact reportable segments, such as a change in segment measures. This is discussed further below.

5.7.1 Changes in organisation structure

When an entity changes its organisational structure in a manner that causes a change in the composition of its reportable segments, corresponding amounts for earlier periods should be restated unless the information is not available and the cost to develop it would be excessive. This requirement also applies to the presentation of segment information in respect of interim periods. *[IFRS 8.29]*.

The exemption from restatement on grounds of excessive cost is applied to each individual item of disclosure. *[IFRS 8.29]*. This means that an entity should restate its comparative information for all the items it can, even if this results in some comparative information not being presented or restated, such as inter-segment revenues. When the composition of reportable segments has changed, an entity should disclose whether the corresponding items of segment information have been restated. *[IFRS 8.29]*.

Where corresponding information is not restated to reflect the new composition of reportable segments, the segment information for the current period should be presented on both the old and the new bases of segmentation. Only if the necessary information were unavailable and the cost of developing it excessive would an entity not have to show current information on the old basis of segmentation. *[IFRS 8.30]*. In our view, given the importance of comparable segment information in particular in years of changing segmentation, the 'excessive cost' criterion represents a high hurdle to overcome.

If an entity decides to change its organisational structure during the reporting period, the fact that this requirement applies equally to interim periods *[IFRS 8.29]* indicates that information presented at the reporting date is also restated to reflect the new basis of segmentation, even though for part of the annual reporting period the entity was managed and monitored on the old basis.

The following extract illustrates that changes in the composition of operating segments can often be combined with a review of other aspects of segment reporting, such as a review of performance measures:

> *Extract 36.11: Nestlé S.A. (2015)*
>
> **Notes** [extract]
>
> 1. **Accounting Policies** [extract]
>
> **Changes in presentation – Analyses by segment** [extract]
>
> The scope of the operating segments has been modified following the changes in management responsibilities as from 1 January 2015. Zone Europe has been renamed Zone Europe, Middle East and North Africa (EMENA) and now includes the Maghreb, the Middle East, the North East Africa region, Turkey and Israel, which were formerly included in Zone Asia, Oceania and Africa. Zone Asia, Oceania and Africa has been renamed Zone Asia, Oceania and sub-Saharan Africa (AOA). Nestlé Nutrition now includes Growing-Up Milks business formerly included in the geographic Zones. Finally, Other businesses now includes the Bübchen business, formerly included in Nestlé Nutrition.
>
> The amount of segment assets is no longer disclosed. Segment assets are not included in the measures used for allocating resources and assessing segment performance. The Group discloses on a voluntary basis invested capital (as defined in Note 3) as well as goodwill and intangible assets by segment for consistency with long-standing practice. Goodwill and intangible assets are not included in invested capital since the amounts recognised are not comparable between segments due to differences in the intensity of acquisition activity and changes in accounting standards which were applicable at various points in time when the Group undertook significant acquisitions.
>
> Information by product has been modified following the main transfer of Growing-Up Milks business in Milk products and Ice cream to Nutrition and Health Science.
>
> Sales and non-current assets in Switzerland and countries which individually represent at least 10% of the Group sales or 10% of the Group non-current assets are disclosed separately, instead of the top ten countries and Switzerland.
>
> In addition, intangible assets are attributed to the country of their legal owner rather than being allocated to the countries of the affiliated companies using these assets. Finally, goodwill items which were presented as part of unallocated items are attributed to the countries of the affiliated companies where the related acquired business is operated.
>
> 2014 comparative information has been restated.

Segment information may also change as a result of the disposal of an entire reportable segment or a component of it which qualifies under IFRS 5 – *Non-current Assets Held for Sale and Discontinued Operations* – as a discontinued operation. The presentation of discontinued operations is governed by IFRS 5. The requirements of other standards do not apply to discontinued operations, unless they specify disclosures applicable to them. *[IFRS 5.5B]*. Since IFRS 8 does not refer to discontinued operations, entities are not required to include them in their segment disclosures. This would be the case even if the CODM continued to monitor the discontinued operation until disposal. Nevertheless, an entity would not be prohibited from disclosing such information if it wished, on the basis that the requirements of IFRS 8 relate to the measures reported to the CODM without any adjustments being made in preparing the entity's IFRS financial statements. *[IFRS 8.25]*.

5.7.2 Changes in segment measures

When an entity changes any of its segment measures, including the definition of segment profit, or changes the allocation of income, expenses, assets or liabilities to segments, without a change to the composition of its reportable segments, the general principles of IAS 1 for changes in presentation or classification of items apply. Therefore, comparative information would be restated, unless this is impracticable. *[IAS 1.41]*.

In 2020, Vodafone Group Plc changed the segment information to reflect the adoption of IFRS 15 for purposes of internal decision making:

Extract 36.12: Vodafone Group Plc (2020)

Notes to the consolidated financial statements [extract]

2. Revenue disaggregation and segmental analysis [extract]

Segmental analysis [extract]

Segmental information used for internal decision making during the years ended 31 March 2018 and 2019 was on an IAS 18 (pre-IFRS 15) basis. In the year ended 31 March 2020 internal decisions were based upon IFRS 15 financial information and accordingly comparative information for the year ended 31 March 2019 was re-presented. Consequently, segmental information for the year ended 31 March 2018 is presented on an IAS 18 (pre-IFRS 15) basis and information for years ended 31 March 2020 and 2019 is presented on an IFRS 15 basis in accordance with the above revenue recognition policy. See note 32 "IAS 18 basis primary statements" for details of the IAS 18 revenue recognition policy.

The Group's measure of segment profit, adjusted EBITDA, excludes depreciation, amortisation, impairment loss, restructuring costs, loss on disposal of fixed assets, the Group's share of results in associates and joint ventures and other income and expense. A reconciliation of adjusted EBITDA to operating profit is shown below. For a reconciliation of operating profit to profit for the financial year, see the Consolidated income statement on page 141.

	2020	2019 (re-presented)[1]	2018
	€m	€m	€m
Adjusted EBITDA	**14,881**	**13,918**	**14,737**
Depreciation, amortisation and loss on disposal of fixed assets	(10,085)	(9,665)	(9,910)
Share of adjusted results in equity accounted associates and joint ventures[2]	(241)	(348)	389
Adjusted operating profit	**4,555**	**3,905**	**5,216**
Impairment losses	(1,685)	(3,525)	–
Restructuring costs[2]	(720)	(486)	(156)
Amortisation of acquired customer based and brand intangible assets[2]	(638)	(583)	(974)
Other income/(expense)[2]	2,257	(262)	213
Interest on lease liabilities	330	–	–
Operating profit/(loss)	**4,099**	**(951)**	**4,299**

Notes:

1. The results reflected in this table for the year ended 31 March 2019 were previously disclosed on an IAS 18 basis in the Annual Report for the year ended 31 March 2019 and have been re-presented in the table above on an IFRS 15 basis.
2. Share of results of equity accounted associates and joint ventures presented within the Consolidated income statement includes –€241m (2019: –€348 million, 2018 €389 million) included within Adjusted operating profit, –€25m (2019: –€26 million, 2018 –€9 million) included within Restructuring costs, –€215 million (2019: –€420 million, 2018 –€439 million) included within Amortisation of acquired customer based and brand intangible assets and –€2,024 million which is principally related to Vodafone Idea Limited (2019: –€114 million, 2018 €nil million) included within Other income/(expense).

5.8 Disclosure of commercially sensitive information

The criteria for determining the externally reportable segments, as discussed at 3.2 above, attempt to define which internally reported operating units can be combined, which must be reported separately and which are included in an unallocated reconciling item. The interaction between these criteria, in particular with the requirement that segments cannot be combined if they exhibit different long-term financial performance, leaves entities open to the risk of having to disclose information that management would be concerned about sharing with competitors, customers, suppliers or employees.

However, IFRS 8 does not permit the omission of segment information when management believes that its disclosure is commercially sensitive or potentially detrimental to the entity's competitive position. Indeed, IAS 1 requires an entity not only to present information in a manner that provides relevant, reliable, comparable and understandable information, but also to provide additional disclosures if compliance with an individual standard is insufficient to enable users to understand the entity's financial position and financial performance. *[IAS 1.17]*. The only justification for failing to meet these requirements is if disclosure would be so misleading that it would conflict with the objective of financial statements set out in the IASB's *Conceptual Framework*. *[IAS 1.19]*.

Given that the objective of IFRS 8 is to disclose information to help users of financial statements evaluate the nature and financial effects of the entity's business activities and the economic environments in which it operates, *[IFRS 8.1]*, this possibility would seem to be remote. The IASB rejected similar concerns raised by respondents to ED 8, noting that entities would be unlikely to suffer competitive harm from the required disclosures since most competitors have sources of detailed information about an entity other than its financial statements. *[IFRS 8.BC44]*. This concern was raised again by respondents to the post-implementation review. However, the IASB continues to reject such a limitation, because it would provide a means for broad-based non-compliance with the standard.[10]

6 ENTITY-WIDE DISCLOSURES FOR ALL ENTITIES

In addition to disclosing segment information derived from the formats and measurements presented to the chief operating decision maker, IFRS 8 requires certain entity-wide disclosures about products and services, geographical areas and major customers. The information described below is required even if the entity has only a single reportable segment, but need not be repeated if already provided as part of the disclosures on reportable segments set out above. *[IFRS 8.31]*. The amounts reported about products and services and about geographical areas in these entity-wide disclosures are measured using the same accounting policies and estimates as the entity's financial statements (i.e. IFRS amounts). *[IFRS 8.32-33]*. As such, the amounts disclosed in this part of the segment disclosures might well be different to the information already provided in other segment information, which might not be measured in accordance with IFRS (see 4 above).

Exemption from the requirements set out at 6.1 and 6.2 below is offered if the necessary information is unavailable and the cost to develop it would be excessive. If disclosure is not made on these grounds, that fact should be stated. *[IFRS 8.32-33]*. Some respondents to ED 8 expressed concern that the basis of this exemption was inconsistent with the test of impracticability in IAS 1, which makes no allowance for the cost of compliance. *[IAS 1.7]*. However, the IASB did not see any merit in divergence from FASB ASC Topic 280 in this respect and therefore retained the exemption from disclosure if the necessary information were unavailable and the cost of developing it excessive. *[IFRS 8.BC46-47]*.

This exemption is not available in respect of the disclosures about major customers set out at 6.3 below.

6.1 Information about products and services

An entity should report revenues from external customers for each product and service or for each group of similar products and services, measuring revenues on the same basis as the entity's financial statements. *[IFRS 8.32]*.

In Extract 36.7 above, Equinor ASA provides segment information based on its internal management reporting, with reportable segments relating to exploration and production activities in Norway and International; marketing, midstream and processing (MMP); and other activities. Accordingly, it also discloses external revenues by product group (and combines it with a geographical analysis of revenue), as follows:

Extract 36.13: Equinor ASA (2019)

Strategic report [extract]

Segment reporting [extract]

The following tables show total revenues and other income by country. [extract]

2019 Total revenues and other income by country (in USD million)	**Crude oil**	**Natural gas**	**Natural gas liquids**	**Refined products**	**Other**	**Total**
Norway	25,106	9,525	4,674	6,334	611	46,250
US	7,120	1,353	1,132	1,697	229	11,532
Denmark	0	12	0	2,580	191	2,783
Brazil	1,099	19	0	0	560	1,678
Other	180	372	0	41	1,358	1,951
Total revenues and other income[1]	33,505	11,281	5,807	10,652	2,949	64,194

1) Excluding net income (loss) from equity accounted investments

6.2 Information about geographical areas

IFRS 8 requires disclosure of the following geographical information:

(a) revenues from external customers, analysed between amounts attributed to the entity's country of domicile and the total of those attributed to all foreign countries; and

(b) non-current assets other than financial instruments, deferred tax assets, post-employment benefit assets and rights arising under insurance contracts, analysed between assets located in the entity's country of domicile and the total of those located in all foreign countries. *[IFRS 8.33]*.

In addition, if revenues from external customers or assets attributed to an individual foreign country are material, separate disclosure of that country's revenues or assets is required. *[IFRS 8.33]*. The Standard does not indicate what might be regarded as 'material', but given the criteria for a reportable segment and a major customer for reporting purposes (see 3.2.2 above and 6.3 below respectively) it would seem appropriate to consider the need for separate disclosure in respect of a foreign country accounting for more than 10% of total external revenues or more than 10% of total non-current assets.

Disclosure of the above information would be required even if the entity's segment reporting is already based on geography and it is determined that individual operating segments include a number of countries. Thus, an entity may need to provide additional information on revenue or non-current assets by country that is not disclosed in the segment information used by the chief operating decision maker.

The basis on which revenues from external customers are attributed to individual countries should be disclosed. An entity can elect to provide, in addition to the information required above, subtotals of geographical information about groups of countries. *[IFRS 8.33]*. In Extract 36.14 below, BAE Systems provides this more detailed level of disclosure and goes on to reconcile the measure of total segment assets to the amounts shown on the statement of financial position, even though such a reconciliation is not required for this entity-wide disclosure.

Extract 36.14: BAE Systems plc (2019)

Notes to the Group accounts [extract]

20. Geographical analysis of assets

Analysis of non-current assets by geographical location

Asset location	Notes	**2019** **£m**	2018 £m
UK		**4,119**	3,610
Rest of Europe		**935**	909
US		**8,830**	8,466
Saudi Arabia		**679**	503
Australia		**435**	420
Rest of Asia and Pacific		**10**	7
Non-current segment assets		**15,008**	13,915
Post-employment benefit surpluses	23	**302**	308
Other financial assets	14	**560**	411
Tax	15,17	**745**	783
Inventories	16	**835**	774
Current trade, other and contract receivables	13	**5,458**	5,177
Cash and cash equivalents	18	**2,587**	3,232
Assets held for sale	19	**135**	146
Consolidated total assets		**25,630**	24,746

6.3 Information about major customers

IFRS 8 also requires an entity to give disclosures indicating the extent of its reliance on its major customers. If revenues from a single external customer account for 10% or more of the entity's total revenues, the entity should disclose:

(a) that fact;

(b) the total amount of revenues from each such customer; and

(c) the identity of the reportable segment or segments reporting the revenues. *[IFRS 8.34]*.

Disclosure is not required of the name of each major customer, nor the amounts of revenue reported in each segment for that customer. *[IFRS 8.34]*. However, the disclosure must be provided if it relates only to one segment.

Roche elects to provide the customers' names in the following extract.

Extract 36.15: Roche Holding Ltd (2019)

Notes to the Roche Group Consolidated Financial Statements [extract]

2. **Operating segment information** [extract]

Major customers

In total three US national wholesale distributors represent approximately a third of the Group's revenues in 2019. The three US national wholesale distributors are McKesson Corp. with CHF 10 billion (2018: CHF 9 billion), AmerisourceBergen Corp. with CHF 8 billion (2018: CHF 7 billion) and Cardinal Health, Inc. with CHF 6 billion (2018: CHF 5 billion). Approximately 96% of these revenues were in the Roche Pharmaceuticals operating segment, with the residual in the Diagnostics operating segment.

6.3.1 *Customers known to be under common control*

For the purposes of the above disclosures, a group of entities known to a reporting entity to be under common control are to be considered a single customer. *[IFRS 8.34].*

However, judgement is required to assess whether a government (including government agencies and similar bodies whether local, national or international), and entities known to the reporting entity to be under the control of that government are considered a single customer. The assessment of whether entities should be regarded as a single customer for these purposes should take into account the extent of economic integration between those entities. *[IFRS 8.34].* The standard does not include any further guidance on the factors relevant to determining the extent of economic integration.

BAE Systems identifies revenues from three principal governments.

Extract 36.16: BAE Systems plc (2019)

Notes to the Group accounts [extract]

1. **Segmental analysis** [extract]

Revenue by major customer

Revenue from the Group's three principal customers, which individually represent over 10% of total revenue, is as follows:

	2019 **£m**	2018 £m
US Department of Defense	**6,547**	5,148
UK Ministry of Defence[1]	**3,868**	3,848
Kingdom of Saudi Arabia Ministry of Defence and Aviation	**2,541**	2,366

1. Includes £0.6bn (2018 £0.7bn) generated under the Typhoon workshare agreement with Eurofighter Jagdflugzeug GmbH.

Revenue from the UK Ministry of Defence and the US Department of Defense was generated by the five principal reporting segments. Revenue from the Kingdom of Saudi Arabia Ministry of Defence and Aviation was generated by Air and Maritime reporting segments.

Chapter 37 Earnings per share

1 INTRODUCTION

Earnings per share (EPS) is one of the most widely quoted statistics in financial analysis. It came into great prominence in the US during the late 1950s and early 1960s due to the widespread use of the price earnings ratio (PE) as a yardstick for investment decisions. As a result, standard setters in some jurisdictions (notably the US and the UK) have had rules on EPS for many years. However, it was not until 1997 that an international accounting standard on the subject was published.

IAS 33 – *Earnings per Share* – was introduced for accounting periods beginning on or after 1 January 1998. In December 2003, as part of the improvements project, the IASB updated IAS 33 to provide more detailed guidance in some complex areas. There have been no substantive changes since. The requirements of IAS 33 are discussed at 2 to 7 below. The standard includes illustrative examples of particular issues and one comprehensive worked example. The illustrative examples are included where relevant in the text of the chapter, whilst the comprehensive worked example is included as an appendix.

1.1 Definitions

IAS 33 defines a number of its terms and these are dealt with in the text of this chapter where appropriate. One term which is particularly pervasive is 'fair value'. This term is defined and explained in IFRS 13 – *Fair Value Measurement* – and is discussed in Chapter 14. *[IAS 33.8]*. However, in the context of share-based payments the term fair value has the meaning used in IFRS 2 – *Share-based Payment*. The relevance of share-based payment to EPS is discussed at 6.4.5 below; IFRS 2 is discussed in Chapter 34. *[IAS 33.47A]*.

2 OBJECTIVE AND SCOPE OF IAS 33

2.1 Objective

IAS 33 sets out its objective as follows: 'to prescribe principles for the determination and presentation of earnings per share, so as to improve performance comparisons between different entities in the same reporting period and between different reporting periods for the same entity. Even though earnings per share data have limitations because of the different accounting policies that may be used for determining "earnings", a consistently determined denominator enhances financial reporting. The focus of this Standard is on the denominator of the earnings per share calculation.' *[IAS 33.1]*.

The standard requires the computation of both basic and diluted EPS, explaining the objective of each as follows:

- the objective of basic earnings per share information is to provide a measure of the interests of each ordinary share of a parent entity in the performance of the entity over the reporting period; *[IAS 33.11]* and
- the objective of diluted earnings per share is consistent with that of basic earnings per share – to provide a measure of the interest of each ordinary share in the performance of an entity – while giving effect to all dilutive potential ordinary shares outstanding during the period. *[IAS 33.32]*.

The underlying logic here is that EPS, including diluted EPS, should be an historical performance measure. This impacts particularly on the reporting of diluted EPS, in steering it away from an alternative purpose: to warn of potential future dilution. Indeed the tension between these differing objectives is evident in the standard. As discussed more fully at 6.4.6 below, IAS 33 sets out a very restrictive regime for including certain potentially dilutive shares in the diluted EPS calculation. Yet diluted EPS is only to take account of those potential shares that would dilute earnings from continuing operations (see 6.3.1 below) which seems to have more of a forward looking 'warning signal' flavour. Discontinued operations are discussed in Chapter 4.

2.2 Scope

IAS 33 applies to:

(a) the separate or individual financial statements of an entity:
    (i) whose ordinary shares or potential ordinary shares are traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local and regional markets); or
    (ii) that files, or is in the process of filing, its financial statements with a securities commission or other regulatory information for the purpose of issuing ordinary shares in a public market; and
(b) the consolidated financial statements of a group with a parent:
    (i) whose ordinary shares or potential ordinary shares are traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local and regional markets); or
    (ii) that files, or is in the process of filing, its financial statements with a securities commission or other regulatory information for the purpose of issuing ordinary shares in a public market. *[IAS 33.2]*.

IAS 33 also applies to any other entity that discloses earnings per share. *[IAS 33.3]*. Where both the parent's consolidated and separate financial statements are presented, the standard only requires consolidated earnings per share to be given. If the parent chooses to present EPS data based on its separate financial statements the standard requires that the disclosures be restricted to the face of the parent-only statement of comprehensive income (or separate income statement) and not be included in the consolidated financial statements. *[IAS 33.4]*.

In January 2014, the IASB published IFRS 14 – *Regulatory Deferral Accounts.* This standard allows a first-time adopter within its scope to continue to account for regulatory deferral account balances in its first IFRS financial statements in accordance with its previous GAAP when it adopts IFRS. The standard introduces limited changes to some previous GAAP accounting practices for regulatory deferral account balances, which are primarily related to the presentation of these accounts. For entities applying IFRS 14 certain additional EPS disclosures are required. This is discussed in Chapter 5 at 5.20.6.B.

3 THE BASIC EPS

IAS 33 requires the computation of basic EPS for the profit or loss (and, if presented, the profit or loss from continuing operations) attributable to ordinary equity holders. *[IAS 33.9]*. It defines, or rather describes, basic earnings per share in the following manner: 'Basic earnings per share shall be calculated by dividing profit or loss attributable to ordinary equity holders of the parent entity (the numerator) by the weighted average number of ordinary shares outstanding (the denominator) during the period.' *[IAS 33.10]*.

3.1 Earnings

The starting point for determining the earnings figure to be used in the basic EPS calculation (both for total earnings and, if appropriate, earnings from continuing operations) is the net profit or loss for the period attributable to ordinary equity holders. *[IAS 33.12]*. This will, in accordance with IAS 1 – *Presentation of Financial Statements* – include all items of income and expense, including, dividends on preference shares classified as liabilities and tax and is stated after the deduction of non-controlling interests. *[IAS 33.13, A1]*. This is then adjusted for the after-tax amounts of preference dividends, differences arising on the settlement of preference shares, and other similar effects of preference shares classified as equity. *[IAS 33.12]*. These adjustments are discussed at 5.2 below.

3.2 Number of shares

An ordinary share is defined as 'an equity instrument that is subordinate to all other classes of equity instruments'. *[IAS 33.5]*. 'Equity instrument' has the same meaning as in IAS 32 – *Financial Instruments: Presentation* – that is 'any contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities'. *[IAS 33.8, IAS 32.11]*. IAS 33 goes on to observe that ordinary shares participate in profit for the period only after other types of share such as preference shares have participated. *[IAS 33.6]*. The standard also clarifies that there may be more than one class of ordinary share and requires the computation and presentation of EPS for each class that has a different right to share in profit for the period. *[IAS 33.6, 66]*. In practice, it is usually straightforward to determine which instruments are ordinary shares for EPS purposes. The treatment of different classes of shares is discussed at 5.4 below.

The basic rule in IAS 33 is that all outstanding ordinary shares are brought into the basic EPS computation – time-weighted for changes in the period (changes in ordinary shares are discussed at 4 below). *[IAS 33.19]*. There are three exceptions to this:

- ordinary shares that are issued as partly paid are included in the weighted average as a fraction of a share based on their dividend participation relative to fully paid shares (so if although only partly paid, they ranked equally for dividends they would be included in full); *[IAS 33.A15]*
- treasury shares, which are presented in the financial statements as a deduction from equity, are not considered outstanding for EPS purposes for the period they are held in treasury. Although not stated explicitly in the standard itself, this requirement is clearly logical (as although the shares are still legally in issue, they are accounted for as if redeemed) and is illustrated in one of the examples appended to the standard (see Example 37.1 at 4.1 below); *[IAS 33.IE2]* and
- shares that are contingently returnable (that is, subject to recall) are not treated as outstanding until they cease to be subject to recall, and hence are excluded from basic EPS until that time. *[IAS 33.24]*.

The standard contains some specific guidance on when newly issued ordinary shares should be considered outstanding. In general, shares are to be included from the date consideration is receivable (considered by the standard generally to be the date of their issue), for example: *[IAS 33.21]*

- shares issued in exchange for cash are included when cash is receivable;
- shares issued on the voluntary reinvestment of dividends on ordinary or preference shares are included when the dividends are reinvested;
- shares issued as a result of the conversion of a debt instrument to ordinary shares are included as of the date interest ceases accruing;
- shares issued in place of interest or principal on other financial instruments are included as of the date interest ceases accruing;
- shares issued in exchange for the settlement of a liability of the entity are included as of the settlement date;
- shares issued as consideration for the acquisition of an asset other than cash are included as of the date on which the acquisition is recognised;
- shares issued in exchange for the rendering of services to the entity are included as the services are rendered; and
- shares that will be issued upon the conversion of a mandatorily convertible instrument are included in the calculation of basic earnings per share from the date the contract is entered into. *[IAS 33.23]*.

Most of these provisions are straightforward, however some are worthy of note.

Shares issued in exchange for services will be accounted for in accordance with IFRS 2, with a charge to income matched by a credit to equity. IAS 33 has some guidance on the inclusion of such potential shares in diluted EPS (see 6.4.5 below); however there is no further elaboration of the meaning of 'included as the services are rendered'. What seems to be implicit in the phrase is that the shares concerned vest unconditionally as services are rendered. On that basis, clearly it would be appropriate to include shares in basic EPS as entitlement to them vests, notwithstanding that the actual issue of shares may be at a different time. However, a very common form of share-based remuneration involves entitlement to shares vesting at the end of an extended period conditional on future events (typically continued employment and sometimes specific future performance). Such arrangements are clearly conditionally issuable shares and should be excluded from basic EPS until vesting. Indeed, when discussing employee share schemes in the context of diluted EPS the standard is explicit, as follows. 'Employee share options with fixed or determinable terms and non-vested ordinary shares are treated as options in the calculation of diluted earnings per share, even though they may be contingent on vesting. They are treated as outstanding on the grant date. Performance-based employee share options are treated as contingently issuable shares because their issue is contingent upon satisfying specified conditions in addition to the passage of time.' *[IAS 33.48]*. Contingently issuable shares are discussed at 6.4.6 below.

In respect of the final bullet point, the standard does not define what a mandatorily convertible instrument is. One view would be that the requirement to account for the shares in EPS from inception must mean it refers to instruments where the proceeds also are received at inception. On that basis, it would exclude a forward contract for the issue of shares which (as required by the first bullet above) would increase the denominator of basic EPS only from the time the cash is receivable. Similarly, in the reverse situation of a forward contract to redeem ordinary shares the shares would only be removed from basic EPS when the consideration becomes payable. Another view would be that all binding agreements to issue or redeem ordinary shares should be reflected in basic EPS when the entity becomes party to the arrangement. A further possible complexity is the question of whether or not a symmetrical treatment for the issue and redemption of shares should be applied for EPS purposes. Whilst that certainly seems logical, it is not beyond question in all circumstances particularly given the asymmetrical accounting treatment for certain derivatives over own shares required by IAS 32 (discussed in Chapter 47 at 5).

More generally, the standard goes on to say the timing of inclusion is determined by the attaching terms and conditions, and also that due consideration should be given to the substance of any contract associated with the issue. *[IAS 33.21]*. Ordinary shares that are issuable on the satisfaction of certain conditions (contingently issuable shares) are to be included in the calculation of basic EPS only from the date when all necessary conditions have been satisfied; in effect when they are no longer contingent. *[IAS 33.24]*. This provision is interpreted strictly, as illustrated in Example 7 appended to the standard (see Example 37.14 at 6.4.6.A below). In that example earnings in a year, by meeting certain thresholds, would trigger the issue of shares. Because it is not certain that the condition is met until the last day of the year (when earnings become known with certainty) the new shares are excluded from basic EPS until the following year. Where shares will be issued at some future date (that is, solely after the passage of time) they are not considered contingently issuable by IAS 33, as the passage of time is a certainty. *[IAS 33.24]*. In principle, this would seem to mean that they should be included in basic EPS from the agreement date. However, careful consideration of the individual facts and circumstances would be necessary.

The calculation of the basic EPS is often simple but a number of complications can arise; these may be considered under the following two headings:

(a) changes in ordinary shares outstanding; and

(b) matters affecting the numerator.

These are discussed in the next two sections.

4 CHANGES IN OUTSTANDING ORDINARY SHARES

Changes in ordinary shares outstanding can occur under a variety of circumstances, the most common of which are dealt with below. Whenever such a change occurs during the accounting period, an adjustment is required to the number of shares in the EPS calculation for that period; furthermore, in certain situations the EPS for previous periods will also have to be recalculated.

4.1 Weighted average number of shares

Implicit in the methodology of IAS 33 is a perceived correlation between the capital of an entity (or rather the income-generating assets it reflects) and earnings. Accordingly, to compute EPS as a performance measure requires adjusting the number of shares in the denominator to reflect any variations in the period to the capital available to generate that period's earnings. The standard observes that using the weighted average number of ordinary shares outstanding during the period reflects the possibility that the amount of shareholders' capital varied during the period as a result of a larger or smaller number of shares being outstanding at any time. The weighted average number of ordinary shares outstanding during the period is the number of ordinary shares outstanding at the beginning of the period, adjusted by the number of ordinary shares bought back or issued during the period multiplied by a time-weighting factor. The time-weighting factor is the number of days that the shares are outstanding as a proportion of the total number of days in the period; IAS 33 notes that a reasonable approximation of the weighted average is adequate in many circumstances. *[IAS 33.20]*. Computation of a weighted average number of shares is illustrated in the following example: *[IAS 33.IE2]*

Example 37.1: Calculation of weighted average number of shares

		Shares issued	*Treasury shares**	*Shares outstanding*
1 January 2021	Balance at beginning of year	2,000	300	1,700
31 May 2021	Issue of new shares for cash	800	–	2,500
1 December 2021	Purchase of treasury shares for cash	–	250	2,250
31 December 2021	Balance at year end	2,800	550	2,250

Calculation of weighted average:

(1,700 × 5/12) + (2,500 × 6/12) + (2,250 × 1/12) = 2,146 shares *or*
(1,700 × 12/12) + (800 × 7/12) – (250 × 1/12) = 2,146 shares

* Treasury shares are equity instruments reacquired and held by the issuing entity itself or by its subsidiaries.

The use of a weighted average number of shares is necessary because the increase in the share capital would have affected earnings only for that portion of the year during which the issue proceeds were available to management for use in the business.

4.2 Purchase and redemption of own shares

An entity may, if it is authorised to do so by its constitution and it complies with any relevant legislation, purchase or otherwise redeem its own shares. Assuming this is done at fair value, then the earnings should be apportioned over the weighted average share capital in issue for the year. This was illustrated in Example 37.1 at 4.1 above in relation to the purchase of treasury shares. If, on the other hand, the repurchase is at significantly more than market value then IAS 33 requires adjustments to be made to EPS for periods before buy-back. This is discussed at 4.3.5 below.

4.3 Changes in ordinary shares without corresponding changes in resources

IAS 33 requires the number of shares used in the calculation to be adjusted (for all periods presented) for any transaction (other than the conversion of potential ordinary shares) that changes the number of shares outstanding without a corresponding change in resources. *[IAS 33.26]*. This is also to apply when some, but not all, such changes have happened after the year-end but before the approval of the financial statements.

The standard gives the following as examples of changes in the number of ordinary shares without a corresponding change in resources:

(a) a capitalisation or bonus issue (sometimes referred to as a stock dividend);

(b) a bonus element in any other issue, for example a bonus element in a rights issue to existing shareholders;

(c) a share split; and

(d) a reverse share split (share consolidation). *[IAS 33.27]*.

Another example not mentioned by the standard would be any bonus element in a buy-back, such as a put warrant involving the repurchase of shares at significantly more than their fair value. The adjustments required to EPS for each of these is discussed below.

As noted above, IAS 33 requires retrospective adjustment for all such events that happen in the reporting period. However, it only requires restatement for those in (a), (c) and (d) if they happen after the year-end but before the financial statements are authorised for issue. *[IAS 33.64]*.

4.3.1 Capitalisation, bonus issue, share split and share consolidation

4.3.1.A Capitalisation, bonus issues and share splits

A capitalisation or bonus issue or share split has the effect of increasing the number of shares in issue without any inflow of resources, as further ordinary shares are issued to existing shareholders for no consideration. Consequently, no additional earnings will be expected to accrue as a result of the issue. The additional shares should be treated as having been in issue for the whole period and also included in the EPS calculation of all earlier periods presented so as to give a comparable result. For example, on a two-for-one bonus issue, the number of ordinary shares outstanding before the issue is multiplied by three to obtain the new total number of ordinary shares, or by two to obtain the number of additional ordinary shares. *[IAS 33.28]*.

The EPS calculation involving a bonus issue is illustrated in the following example. *[IAS 33.IE3]*.

Example 37.2: A bonus issue

Profit attributable to ordinary equity holders of the parent entity 2020	£180
Profit attributable to ordinary equity holders of the parent entity 2021	£600
Ordinary shares outstanding until 30 September 2021	200
Bonus issue 1 October 2021	2 ordinary shares for each ordinary share outstanding at 30 September 2021
	$200 \times 2 = 400$
Basic earnings per share 2021	$\frac{\text{£}600}{(200 + 400)} = \text{£}1.00$
Basic earnings per share 2020	$\frac{\text{£}180}{(200 + 400)} = \text{£}0.30$

Because the bonus issue was without consideration, it is treated as if it had occurred before the beginning of 2020, the earliest period presented.

Again, although the standard is silent on the matter, we believe that any financial ratios disclosed for earlier periods, which are based on the number of equity shares at a year-end (e.g. dividend per share) should also be adjusted in a similar manner.

4.3.1.B Stock dividends

Stock or scrip dividends refer to the case where an entity offers its shareholders the choice of receiving further fully paid up shares in the company as an alternative to receiving a cash dividend. It could be argued that the dividend foregone represents payment for the shares, usually at fair value, and hence no restatement is appropriate. Alternatively, the shares could be viewed as being, in substance, bonus issues which require the EPS for the earlier period to be adjusted. IAS 33 seems to suggest the latter view, as it notes that capitalisation or bonus issues are sometimes referred to as stock dividends. However, entities often refer to these arrangements as dividend reinvestment plans which suggests the acquisition of new shares for valuable consideration.

In our view, this distinction should be a factual one. If an entity (say, through proposal and subsequent approval by shareholders) has a legal obligation to pay a dividend in cash or, at the shareholder's option, shares then the cash payment avoided if the stock dividend is taken up is consideration for the shares. This may be equivalent to an issue at fair value or it may contain some bonus element requiring retrospective adjustment of EPS. In practice the fair value of shares received as a stock dividend alternative may exceed the cash alternative; this is often referred to as an enhanced stock dividend. In these cases IAS 33 requires a bonus element to be identified, and prior EPS figures restated accordingly. This is essentially the same as adjustments for the bonus element in a rights issue, discussed at 4.3.3 below.

Furthermore, in this scenario, during the period between the obligation coming into existence and its settlement (in cash or shares) it could be argued to represent a written call option and hence potentially affect diluted EPS (see 6.4.2.B below). Given that the standard is silent on this aspect of some stock dividends we do not believe that such an approach was intended. In any event, we generally do not believe the effect on diluted EPS would be significant. Conversely, if the entity issues new shares instead of a dividend it would be a bonus issue requiring full retrospective adjustment to EPS.

4.3.1.C Share consolidations

Occasionally, entities will consolidate their equity share capital into a smaller number of shares. Such a consolidation generally reduces the number of shares outstanding without a corresponding outflow of resources, and this would require an adjustment to the denominator for periods before the consolidation. *[IAS 33.29]*.

4.3.2 Share consolidation with a special dividend

Share consolidations as discussed at 4.3.1.C above normally do not involve any outflow of funds from the entity. However, entities may return surplus cash to their shareholders by paying special dividends accompanied by a share consolidation, the purpose of which is to maintain the value of each share following the payment of the dividend. This issue is specifically addressed by IAS 33. The normal rule of restating the outstanding number of shares for all periods for a share consolidation is not applied when the overall effect is a share repurchase at fair value because in such cases the reduction of shares is the result of a corresponding reduction in resources. In such cases the weighted average number of shares is adjusted for the consolidation from the date the special dividend is recognised. *[IAS 33.29]*.

4.3.3 Rights issue

A rights issue is a popular method through which entities are able to access the capital markets for further capital. Under the terms of such an issue, existing shareholders are given the opportunity to acquire further shares in the entity on a *pro rata* basis to their existing shareholdings.

The 'rights' shares will usually be offered either at the current market price or at a price below that. In the former case, the treatment of the issue for EPS purposes is as discussed at 4.1 above. However, where the rights price is at a discount to market it is not quite as straightforward, since the issue is equivalent to a bonus issue (see 4.3.1 above) combined with an issue at full market price. In such cases, IAS 33 requires an adjustment to the number of shares outstanding before the rights issue to reflect the bonus element inherent in it. *[IAS 33.26-27]*.

The bonus element of the rights issue available to all existing shareholders is given by the following adjustment factor, sometimes referred to as the bonus fraction: *[IAS 33.A2]*

$$\frac{\text{Fair value per share immediately before the exercise of rights}}{\text{Theoretical ex-rights fair value per share}}$$

The fair value per share immediately before the exercise of rights is the actual price at which the shares are quoted inclusive of the right to take up the future shares under the rights issue. Where the rights are to be traded separately from the shares the fair value used is the closing price on the last day on which the shares are traded inclusive of the right. *[IAS 33.A2]*.

The 'ex-rights fair value' is the theoretical price at which the shares would be expected to be quoted, other stock market factors apart, after the rights issue shares have been issued. It is calculated by adding the aggregate fair value of the shares immediately before the exercise of the rights to the proceeds from the exercise, and dividing by the number of shares outstanding after the exercise. *[IAS 33.A2]*. The EPS calculation involving a rights issue is illustrated in the following example. *[IAS 33.IE4]*.

Example 37.3: Rights issue at less than full market price

		2019	2020	2021
Profit attributable to ordinary equity holders of the parent entity		$1,100	$1,500	$1,800
Shares outstanding before rights issue	500 shares			
Rights issue	One new share for each five outstanding shares (100 new shares total) Exercise price: $5.00 Date of rights issue: 1 January 2020 Last date to exercise rights: 1 March 2020			
Market price of one ordinary share immediately before exercise on 1 March 2020	$11.00			
Reporting date	31 December			

Calculation of theoretical ex-rights value per share

$$\frac{\text{Fair value of all outstanding shares before the exercise of rights} + \text{Total amount received from exercise of rights}}{\text{Number of shares outstanding before exercise} + \text{Number of shares issued in the exercise}} =$$

$$\frac{(\$11.00 \times 500 \text{ shares}) + (\$5.00 \times 100 \text{ shares})}{500 \text{ shares} + 100 \text{ shares}}$$

Theoretical ex-rights value per share = $10.00

Calculation of adjustment factor

$$\frac{\text{Fair value per share before exercise of rights}}{\text{Theoretical ex-rights value per share}} = \frac{\$11.00}{\$10.00} = 1.10$$

Calculation of basic earnings per share

	2019	2020	2021
2019 basic EPS as originally reported:			
$1,100 ÷ 500 shares =	$2.20		
2019 basic EPS restated for rights issue: $1,100 ÷ (500 shares × 1.1) =	$2.00		
2020 basic EPS including effects of rights issue:			
$\frac{\$1,500}{(500 \times 1.1 \times 2/12) + (600 \times 10/12)} =$		$2.54	
2021 basic EPS: $1,800 ÷ 600 shares =			$3.00

Rather than multiplying the denominator by 11/10ths, the previous year's EPS (and any EPS disclosures in a historical summary) could alternatively be arrived at by multiplying the original EPS by 10/11ths.

During the period that the rights are outstanding they represent, strictly speaking, a written call option over the entity's shares which could have implications for diluted EPS (see 6.4.2 below).

It is possible that shares could be issued as a result of open offers, placings and other offerings of equity shares not made to existing shareholders, at a discount to the market price. In such cases it would be necessary to consider whether the issue contained a bonus element, or rather simply reflected differing views on the fair value of the shares. In our opinion the latter is a more realistic alternative. Accordingly the shares should be dealt with on a weighted average basis without calculating any bonus element when computing the EPS.

4.3.4 B share schemes

One method by which some entities have returned capital to shareholders is the so-called 'B share scheme'. These schemes involve issuing 'B shares' (usually undated preference shares with low or zero coupons) to existing shareholders, either as a bonus issue or via a share split, following which the ordinary shares are consolidated. The 'B shares' are then repurchased or redeemed for cash and cancelled. The overall effect is intended to be the same as a repurchase of ordinary shares at fair value, and accordingly no retrospective adjustment to EPS is necessary, assuming that the intention is achieved. *[IAS 33.29]*.

4.3.5 Put warrants priced above market value

As noted at 4.3 above, an example of a change in the number of shares outstanding without a corresponding change in resources not mentioned by the standard would be any bonus element in a buy-back, such as a put warrant involving the repurchase of shares at significantly more than their fair value. The accounting requirements for such instruments are discussed in Chapter 47 at 5.

IAS 33 does not give an illustrative calculation for a put warrant at significantly more than fair value, but it does for the more familiar rights issue (which are discussed at 4.3.3 above). In a rights issue new shares are issued at a discount to market value, whereas with put warrants shares are bought back at a premium to market value. In both cases the remaining shares are viewed as being devalued for the purposes of comparing EPS over time. Applying the logic of adjusting EPS when there is a change in the number of shares without a corresponding change in resources would seem to require that put warrants are treated as a reverse rights issue. This would mean calculating a similar 'adjustment factor', and applying it to the number of shares outstanding before the transaction. The difference in the calculation would be that the number of shares issued and the consideration received for them would be replaced by negative amounts representing the number of shares put back to the entity and the amount paid for them.

An illustration of what this might entail is as follows:

Example 37.4: Put warrants priced above market value

The following example takes the same scenario as Example 37.3 above (a rights issue), altered to illustrate a put warrant scheme. In that example the shares are issued at a discount of $6.00 to the $11.00 market price on a one for five basis two months into the year. Reversing this would give a put warrant to sell shares back to the company at a $6 premium, again on a one for five basis. All other details have been left the same for comparability, although in reality the rising earnings following a rights issue may well become falling earnings after a buy-back. The calculation would then become:

Calculation of theoretical ex-warrant value per share

$$\frac{\text{Fair value of all outstanding shares before the exercise of warrants} - \text{Total amount paid on exercise of warrants}}{\text{Shares outstanding before exercise} - \text{Shares cancelled in the exercise}} =$$

$$\frac{(\$11 \times 500) - (\$17 \times 100)}{500 - 100} = \$9.50$$

Calculation of adjustment factor

$$\frac{\text{Fair value per share before exercise of warrants}}{\text{Theoretical ex-warrant value per share}} = \frac{\$11}{\$9.5} = 1.16$$

Calculation of basic earnings per share

	2019	2020	2021
2019 EPS as originally reported: $1,100 ÷ 500 shares =	$2.20		
2019 EPS restated for warrants: $1,100 ÷ (500 shares × 1.16) =	$1.90		
2020 EPS including effects of warrants: $\frac{\$1,500}{(500 \times 1.16 \times 2/12) + (400 \times 10/12)} =$		$3.49	
2021 basic EPS: $1,800 ÷ 400 shares =			$3.49

Whilst the above seems a sensible interpretation of the requirements, as the procedure is not specified there may be scope for other interpretations.

4.4 Options exercised during the year

Shares issued as a result of options being exercised should be dealt with on a weighted average basis in the basic EPS. *[IAS 33.38]*. Furthermore, options that have been exercised during the year will also affect diluted EPS calculations. If the options in question would have had a diluting effect on the basic EPS had they been exercised at the beginning of the year, then they should be considered in the diluted EPS calculation as explained in 6.4.2 below, but on a weighted average basis for the period up to the date of exercise. The exercise of options is a 'conversion of potential ordinary shares'. The standard excludes such conversions from the general requirement (see 4.3 above) to adjust prior periods' EPS when a change in the number of shares happens without a corresponding change in resources. *[IAS 33.26]*.

4.5 Post balance sheet changes in capital

The EPS figure should not reflect any changes in the capital structure occurring after the reporting period, but before the financial statements are authorised for issue, which was effected for fair value. This is because any proceeds received from the issue were not available for use during the period. However, EPS for all periods presented should be adjusted for any bonus element in certain post year-end changes in the number of shares, as discussed at 4.3 above. When this is done that fact should be disclosed. *[IAS 33.64]*.

4.6 Issue to acquire another business

4.6.1 Acquisitions

As a result of a share issue to acquire another business, funds or other assets will flow into the reporting entity and extra profits will be expected to be generated. When calculating EPS, it should be assumed that the shares were issued on the acquisition date (even if the actual date of issue is later), since this will be the date from which the results of the newly acquired business are recognised. *[IAS 33.21(f), 22]*.

4.6.2 Reverse acquisitions

Reverse acquisition is the term used to describe a business combination whereby the legal parent entity after the combination is in substance the acquired and not the acquiring entity (discussed in Chapter 9 at 14). IAS 33 is silent on the subject; however, an appendix to IFRS 3 – *Business Combinations* – contains a discussion of the implications for EPS of such transactions. Following a reverse acquisition the equity structure appearing in the consolidated financial statements will reflect the equity of the legal parent, including the equity instruments issued by it to effect the business combination. *[IFRS 3.B25]*.

For the purposes of calculating the weighted average number of ordinary shares outstanding during the period in which the reverse acquisition occurs:

(a) the number of ordinary shares outstanding from the beginning of that period to the acquisition date shall be computed on the basis of the weighted average number of ordinary shares of the legal acquiree (accounting acquirer) outstanding during the period multiplied by the exchange ratio established in the merger agreement; and

(b) the number of ordinary shares outstanding from the acquisition date to the end of that period shall be the actual number of ordinary shares of the legal acquirer (the accounting acquiree) outstanding during that period. *[IFRS 3.B26]*.

The basic EPS disclosed for each comparative period before the acquisition date is calculated by dividing the profit or loss of the legal subsidiary attributable to ordinary shareholders in each of those periods by the legal acquiree's historical weighted average number of ordinary shares outstanding multiplied by the exchange ratio established in the acquisition agreement. *[IFRS 3.B27]*.

IFRS 3 presents an illustrative example of a reverse acquisition, including the EPS calculation, see Chapter 9 at 14.5.

4.6.3 Establishment of a new parent undertaking

Where a new parent entity is established by means of a share for share exchange and its consolidated financial statements have been presented as a continuation of the existing group (discussed in Chapter 10 at 4.2.1), the number of shares taken as being in issue for both the current and preceding periods would be the number of shares issued by the new parent entity. However, EPS calculations for previous periods in the new parent entity's financial statements would have to reflect any changes in the number of outstanding ordinary shares of the former parent entity that may have occurred in those periods, as illustrated in the example below:

Example 37.5: Calculation of EPS where a new holding company is established

Entity A has been established as the newly formed parent entity of Entity B in a one for one share exchange on 30 June 2021. At that date, Entity B has 1,000,000 £1 ordinary shares in issue. Previously, on 30 June 2020 Entity B had issued 200,000 £1 ordinary shares for cash at full market price. Both entities have a 31 December year-end and the trading results of Entity B are as follows:

	2021 £	2020 £
Profit for equity shareholders after taxation	500,000	300,000

The earnings per share calculation of Entity A is shown below:

		2021		2020
Number of equity shares			$800{,}000 \times \frac{6}{12} =$	400,000
			$1{,}000{,}000 \times \frac{6}{12} =$	500,000
		1,000,000		900,000
EPS	$\frac{500{,}000}{1{,}000{,}000} =$	£0.50	$\frac{300{,}000}{900{,}000} =$	£0.33

If, in the above example, the share exchange did not take place on a one for one basis, but Entity A issued three shares for every one share held in Entity B, then the number of shares issued by Entity B in 2020 would have to be apportioned accordingly before carrying out the weighted average calculation. The earnings per share calculation would, therefore, have been as follows:

		2021		2020
Number of equity shares			$2{,}400{,}000 \times \frac{6}{12} =$	1,200,000
			$3{,}000{,}000 \times \frac{6}{12} =$	1,500,000
		3,000,000		2,700,000
EPS	$\frac{500{,}000}{3{,}000{,}000}$	= £0.17	$\frac{300{,}000}{2{,}700{,}000}$	= £0.11

4.7 Adjustments to EPS in historical summaries

In order to ensure comparability of EPS figures, the previously published EPS figures for all periods presented in IFRS financial statements should be adjusted for subsequent changes in capital not involving full consideration at fair value (apart from the conversion of potential ordinary shares) in the manner described at 4.3 above. Often entities will include EPS figures in historical summaries (typically five years) in the analyses and discussions accompanying (but not part of) the financial statements. We believe that all such analyses need similar adjustments in order to be meaningful. We also believe that the resultant figures should be described as restated.

5 MATTERS AFFECTING THE NUMERATOR

5.1 Earnings

The earnings figure on which the basic EPS calculation is based should be the consolidated net profit or loss for the year after tax, non-controlling interests and after adjusting for returns to preference shareholders that are not already included in net profit (as will be the case for preference shares classified as liabilities under IAS 32).

5.2 Preference dividends

The adjustments to net profit attributable to ordinary shareholders in relation to returns to preference shareholders should include:

- the after-tax amount of any preference dividends on non-cumulative preference shares declared in respect of the period; *[IAS 33.14(a)]*
- the after-tax amount of the preference dividends for cumulative preference shares required for the period, whether or not the dividends have been declared. This does not include the amount of any preference dividends for cumulative preference shares paid or declared during the current period in respect of previous periods; *[IAS 33.14(b)]*
- any original issue discount or premium on increasing rate preference shares which is amortised to retained earnings using the effective interest method. Increasing rate preference shares are those that provide: a low initial dividend to compensate an entity for selling them at a discount; or an above-market dividend in later periods to compensate investors for purchasing them at a premium (see Example 37.6 below); *[IAS 33.15]*
- the excess of the fair value of the consideration paid to shareholders over the carrying amount of the preference shares when the shares are repurchased under an entity's tender offer to the holders. As this represents a return to the holders of the shares (and a charge to retained earnings for the entity) it is deducted in calculating profit or loss attributable to ordinary equity holders of the parent entity; *[IAS 33.16]*
- the excess of the fair value of the ordinary shares or other consideration paid over the fair value of the ordinary shares issuable under the original conversion terms when early conversion of convertible preference shares is induced through favourable changes to the original conversion terms or the payment of additional consideration. This is a return to the preference shareholders, and accordingly is deducted in calculating profit or loss attributable to ordinary equity holders of the parent entity; *[IAS 33.17]* and
- any excess of the carrying amount of preference shares over the fair value of the consideration paid to settle them. This reflects a gain to the entity and is added in calculating profit or loss attributable to ordinary equity holders. *[IAS 33.18]*.

The computation of EPS involving increasing rate preference shares is illustrated in the following example. *[IAS 33.IE1]*.

Example 37.6: Increasing rate preference shares

Entity D issued non-convertible, non-redeemable class A cumulative preference shares of ¥100 par value on 1 January 2021. The class A preference shares are entitled to a cumulative annual dividend of ¥7 per share starting in 2024 At the time of issue, the market rate dividend yield on the class A preference shares was

7 per cent a year. Thus, Entity D could have expected to receive proceeds of approximately ¥100 per class A preference share if the dividend rate of ¥7 per share had been in effect at the date of issue.

In consideration of the dividend payment terms, however, the class A preference shares were issued at ¥81.63 per share, i.e. at a discount of ¥18.37 per share. The issue price can be calculated by taking the present value of ¥100, discounted at 7 per cent over a three-year period. Because the shares are classified as equity, the original issue discount is amortised to retained earnings using the effective interest method and treated as a preference dividend for earnings per share purposes. To calculate basic earnings per share, the following imputed dividend per class A preference share is deducted to determine the profit or loss attributable to ordinary equity holders of the parent entity:

Year paid	Carrying amount of class A preference shares 1 January	Imputed dividend[1]	Carrying amount of class A preference shares 31 December[2]	Dividend
	¥	¥	¥	¥
2021	81.63	5.71	87.34	–
2022	87.34	6.12	93.46	–
2023	93.46	6.54	100.00	–
Thereafter:	100.00	7.00	107.00	(7.00)

[1] at 7% of the carrying amount.

[2] This is before dividend payment.

5.3 Retrospective adjustments

Where comparative figures have been restated (for example, to correct a material error or as a result of a change in accounting policy), earnings per share for all periods presented should also be restated. *[IAS 33.64]*.

5.4 Participating equity instruments and two class shares

As noted at 3.2 above, IAS 33 envisages entities having more than one class of ordinary shares and requires the calculation and presentation of EPS for each such class. *[IAS 33.66]*. Although perhaps not exactly obvious from the definition, some instruments that have a right to participate in profits are viewed by the standard as ordinary shares. The standard observes that the equity of some entities includes:

(a) instruments that participate in dividends with ordinary shares according to a predetermined formula (for example, two for one) with, at times, an upper limit on the extent of participation (for example, up to, but not beyond, a specified amount per share); and

(b) a class of ordinary shares with a different dividend rate from that of another class of ordinary shares but without prior or senior rights. *[IAS 33.A13]*.

Whilst category (a) could encompass some participating preference shares (as illustrated in Example 37.7 below), not all participating preference shares would necessarily be treated as ordinary shares for EPS purposes. This is because the participation features of some instruments could mean that they are not subordinate to all other classes of equity instrument. The meaning of ordinary shares for EPS purposes is discussed at 3.2 above.

To calculate basic (and diluted) earnings per share:

(a) profit or loss attributable to ordinary equity holders of the parent entity is adjusted (a profit reduced and a loss increased) by the amount of dividends declared in the period for each class of shares and by the contractual amount of dividends (or interest on participating bonds) that must be paid for the period (for example, unpaid cumulative dividends);

(b) the remaining profit or loss is allocated to ordinary shares and participating equity instruments to the extent that each instrument shares in earnings as if all of the profit or loss for the period had been distributed. The total profit or loss allocated to each class of equity instrument is determined by adding together the amount allocated for dividends and the amount allocated for a participation feature; and

(c) the total amount of profit or loss allocated to each class of equity instrument is divided by the number of outstanding instruments to which the earnings are allocated to determine the earnings per share for the instrument.

For the calculation of diluted earnings per share, all potential ordinary shares assumed to have been issued are included in outstanding ordinary shares. *[IAS 33.A14]*. This is discussed at 6.4 below.

Participating equity instruments and two-class ordinary shares are illustrated with the following example. *[IAS 33.IE11]*.

Example 37.7: Participating equity instruments and two-class ordinary shares

Profit attributable to equity holders of the parent entity	$100,000
Ordinary shares outstanding	10,000
Non-convertible preference shares	6,000
Non-cumulative annual dividend on preference shares (before any dividend is paid on ordinary shares)	$5.50 per share

After ordinary shares have been paid a dividend of $2.10 per share, the preference shares participate in any additional dividends on a 20:80 ratio with ordinary shares (i.e. after preference and ordinary shares have been paid dividends of $5.50 and $2.10 per share, respectively, preference shares participate in any additional dividends at a rate of one-fourth of the amount paid to ordinary shares on a per-share basis).

Dividends on preference shares paid	$33,000	($5.50 per share)
Dividends on ordinary shares paid	$21,000	($2.10 per share)

Basic earnings per share is calculated as follows:

	$	$
Profit attributable to equity holders of the parent entity		100,000
Less dividends paid:		
Preference	33,000	
Ordinary	21,000	
		(54,000)
Undistributed earnings		46,000

Allocation of undistributed earnings:
Allocation per ordinary share = A
Allocation per preference share = B; B = 1/4 A

$(A \times 10{,}000) + (1/4\ A \times 6{,}000) = \$46{,}000$
$A = \$46{,}000 \div (10{,}000 + 1{,}500)$
$A = \$4.00$
$B = 1/4\ A$
$B = \$1.00$

Basic per share amounts:

	Preference shares	*Ordinary shares*
Distributed earnings	\$5.50	\$2.10
Undistributed earnings	\$1.00	\$4.00
Totals	\$6.50	\$6.10

N.B. This example does not illustrate the classification of the components of convertible financial instruments as liabilities and equity or the classification of related interest and dividends as expenses and equity as required by IAS 32.

5.4.1 *Tax deductible dividends on participating equity instruments*

In June 2017 the Interpretations Committee published an agenda decision in response to a request to clarify the treatment for EPS purposes of tax deductible dividends on participating equity instruments.[1]

The question asked of the Committee was whether, in determining profit attributable to ordinary shareholders in the basic EPS calculation, an entity should reflect the tax benefit that would arise from the hypothetical distribution of profit to participating equity holders.

The Committee concluded that, when calculating basic EPS in the fact pattern described in the submission, an entity should adjust profit or loss attributable to ordinary shareholders for the portion of any tax benefit attributable to those ordinary shareholders. This is because the tax benefit is a direct consequence of the hypothetical distribution of profit to the participating equity holders required by IAS 33 (see 5.4 above). This accounting treatment should be applied regardless of whether an entity would have recognised the tax benefit in equity or in profit or loss.

Because, in its view, the principles and requirements in IAS 33 provide an adequate basis to calculate basic EPS in this scenario the Committee decided not to add this matter to its standard-setting agenda. In publishing this decision, the Committee indicated its decision to publish an illustrative example as educational material to accompany the agenda decision, although no indication of when it would do so was given.

5.5 Other bases

It is not uncommon for entities to supplement the EPS figures required by IAS 33 by voluntarily presenting additional amounts per share. For additional earnings per share amounts, the standard requires:

(a) that the denominator used should be that required by IAS 33;

(b) that basic and diluted amounts be disclosed with equal prominence and presented in the notes;

(c) an indication of the basis on which the numerator is determined, including whether amounts per share are before or after tax; and

(d) if the numerator is not reported as a line item in the statement of comprehensive income or separate statement of profit or loss, a reconciliation to be provided between it and a line item that is reported in the statement of comprehensive income. *[IAS 33.73, 73A]*.

In September 2007 the IASB indicated that it intended, as part of the annual improvements project, to modify IAS 33 to prohibit the presentation of alternative EPS figures on the face of the statement of comprehensive income. *[IAS 1.BC103]*. However, that project was ultimately finalised without addressing this issue. As a result, alternative EPS figures may be (and, in practice, are) presented on the face of the statement of comprehensive income (or separate income statement) as well as in the notes, provided that basic and diluted amounts are similarly disclosed with equal prominence. Possible future developments in this regard are discussed at 5.5.1 below.

The prevalence, within the European Union, of reporting alternative EPS measures on the face of the income statement was a matter considered by the European Securities and Markets Authority (ESMA). In April 2018 it published a report entitled *Enforcement and Regulatory Activities of Accounting Enforcers in 2017.*

The report includes (at paragraph 31) the following: 'Around 16% of issuers disclosed, in addition to basic and diluted earnings per share, amounts per share using a reported component of the statement of comprehensive income other than required by IAS 33.' The document goes on to observe that of these, 54% presented the information 'in the notes rather than on the face of the statement'.

From this we infer that, of the sample examined by ESMA, approximately half of entities disclosing alternative EPS presented the information on the face of the income statement.

5.5.1 Possible future changes

The IASB is in the process of developing what it describes as improvements in 'how information is communicated in the financial statements, with a focus on the statement(s) of financial performance'.[2] At its meeting in May 2019 the IASB decided the consultation document for this project would be an exposure draft which would not be preceded by a discussion paper. The exposure draft was published in December 2019; it contains a proposal to amend IAS 33 to include the following: 'If, ... an entity discloses an additional amount per share it shall ... be disclosed in the notes to financial statements, but not be presented in the primary financial statement(s).'[3] The deadline for comments on the draft was September 2020 and the Board will consider feedback on the Exposure Draft in developing its final requirements.

6 DILUTED EARNINGS PER SHARE

6.1 The need for diluted EPS

The presentation of basic EPS seeks to show a performance measure, by computing how much profit an entity has earned for each of the shares in issue for the period. Entities often enter into commitments to issue shares in the future which would result in a change in basic EPS. IAS 33 refers to such commitments as potential ordinary shares, which it defines as 'a financial instrument or other contract that may entitle its holder to ordinary shares'. *[IAS 33.5]*.

Examples of potential ordinary shares given by IAS 33 are:

(a) financial liabilities or equity instruments, including preference shares, that are convertible into ordinary shares;

(b) options and warrants (whether accounted for under IAS 32 or IFRS 2);

(c) shares that would be issued upon the satisfaction of conditions resulting from contractual arrangements, such as the purchase of a business or other assets. *[IAS 33.7]*.

When potential shares are actually issued, the impact on basic EPS will be two-fold. First, the number of shares in issue will change; second, profits could be affected, for example by lower interest charges or the return made on cash inflows. Scenarios whereby such an adjustment to basic EPS is unfavourable are described by the standard as dilution, defined as 'a reduction in earnings per share or an increase in loss per share resulting from the assumption that convertible instruments are converted, that options or warrants are exercised, or that ordinary shares are issued upon the satisfaction of specified conditions'. *[IAS 33.5]*. This potential fall in EPS is quantified by computing diluted EPS, and as a result:

(a) profit or loss attributable to equity holders is increased by the after-tax amount of dividends and interest recognised in the period in respect of the dilutive potential ordinary shares and is adjusted for any other changes in income or expense that would result from the conversion of the dilutive potential ordinary shares; and

(b) the weighted average number of ordinary shares outstanding is increased by the weighted average number of additional ordinary shares that would have been outstanding assuming the conversion of all dilutive potential ordinary shares. *[IAS 33.32]*.

6.2 Calculation of diluted EPS

IAS 33 requires a diluted EPS figure to be calculated for the profit or loss attributable to ordinary equity holders of the parent and, if presented, profit or loss from continuing operations attributable to them. *[IAS 33.30]*. For these purposes, the profit or loss attributable to ordinary equity holders and the weighted average number of shares outstanding should be adjusted for the effects of all potential ordinary shares. *[IAS 33.31]*. In calculating diluted EPS, the number of shares should be that used in calculating basic EPS, plus the weighted average number of shares that would be issued on the conversion of all the dilutive potential ordinary shares into ordinary shares. As is the case for outstanding shares in the basic EPS calculation, potential ordinary shares should be weighted for the period they are outstanding. *[IAS 33.36, 38]*. Accordingly, potential ordinary shares:

- should be deemed to have been converted into ordinary shares at the beginning of the period or, if not in existence at the beginning of the period, the date of their issue; *[IAS 33.36]*
- which are cancelled or allowed to lapse should be included only for the period they are outstanding; and
- which convert into ordinary shares during the period are included up until the date of conversion (from which point they will be included in the basic EPS). *[IAS 33.38]*.

The number of dilutive potential ordinary shares should be determined independently for each period presented, and not subsequently revisited. In particular, prior periods' EPS are not restated for changes in assumptions about the conversion of potential shares into shares. IAS 33 also stresses that the number of dilutive potential ordinary shares included in the year-to-date period is not a weighted average of the dilutive potential ordinary shares included in each interim computation. *[IAS 33.37, 65]*. This is illustrated in the comprehensive illustrative example accompanying IAS 33, the substance of which is reproduced in the appendix to this chapter.

6.2.1 Diluted earnings

The earnings figure should be that used for basic EPS adjusted to reflect any changes that would arise if the potential shares outstanding in the period were actually issued. Adjustment is to be made for the post-tax effects of:

(a) any dividends or other items related to dilutive potential ordinary shares deducted in arriving at the earnings figure used for basic EPS;

(b) any interest recognised in the period related to dilutive potential ordinary shares; and

(c) any other changes in income or expense that would result from the conversion of the dilutive potential ordinary shares. *[IAS 33.33]*.

These adjustments will also include any amounts charged in accordance with the effective interest method prescribed by IFRS 9 – *Financial Instruments* – as a result of allocating transaction costs, premiums or discounts over the term of the instrument. *[IAS 33.34]*. Instruments with a choice of settlement method may also require adjustments to the numerator as discussed at 6.2.2 below.

The standard notes that certain earnings adjustments directly attributable to the instrument could also affect other items of income or expense which will need to be accounted for. For example, the lower interest charge following conversion of convertible debt could lead to higher charges under profit sharing schemes. *[IAS 33.35]*.

No imputed earnings are taken into account in respect of the proceeds to be received on exercise of share options or warrants. The effect of such potential ordinary shares on the diluted EPS is reflected in the computation of the denominator. This is discussed at 6.4.2 below.

6.2.2 Diluted number of shares

IAS 33 discusses a number of specific types of potential ordinary shares and how they should be brought into the calculation; these are discussed at 6.4 below.

More generally, the standard also discusses scenarios where the method of conversion or settlement of potential ordinary shares is at the discretion of one of the parties, as follows:

(a) the number of shares that would be issued on conversion should be determined from the terms of the potential ordinary shares. When more than one basis of conversion exists, the calculation should assume the most advantageous conversion rate or exercise price from the standpoint of the holder of the potential ordinary shares; *[IAS 33.39]*

(b) when an entity has issued a contract that may be settled in shares or cash at its option, it should presume that the contract will be settled in shares. The resulting potential ordinary shares would be included in diluted earnings per share if the effect is dilutive. *[IAS 33.58]*. When such a contract is presented for accounting purposes as an asset or a liability, or has an equity component and a liability component, the numerator should be adjusted for any changes in profit or loss that would have resulted during the period if the contract had been classified wholly as an equity instrument. That adjustment is similar to the adjustments discussed at 6.2.1 above; *[IAS 33.59]* and

(c) for contracts that may be settled in ordinary shares or cash at the holder's option, the more dilutive of cash settlement and share settlement should be used in calculating diluted earnings per share. *[IAS 33.60]*.

An example of an instrument covered by (b) above is a debt instrument that, on maturity, gives the issuer the unrestricted right to settle the principal amount in cash or in its own ordinary shares (see Example 37.10 at 6.4.1.A below). An example of an instrument covered by (c) is a written put option that gives the holder a choice of settling in ordinary shares or cash. *[IAS 33.61]*.

In our view, the requirements of the standard in (b) and (c) above relating to settlement options are somewhat confused. In particular they seem to envisage a binary accounting model based on the strict legal form of settlement (cash or shares). However, IAS 32 sets out rules for three different settlement methods – net cash, net shares and gross physical settlement (discussed in Chapter 47 at 5). One consequence of the above is that, if taken literally, the numerator is only required to be adjusted to remove items of income or expense arising from a liability when there is a choice of settlement method. However, mandatory net share settlement also gives rise to a liability and income/expense under IAS 32. In our view any such income statement items should be removed for diluted EPS purposes.

6.3 Dilutive potential ordinary shares

Only those potential shares whose issue would have a dilutive effect on EPS are brought into the calculation. Potential ordinary shares are 'antidilutive' when their conversion to ordinary shares would increase earnings per share or decrease loss per share. *[IAS 33.5, 43]*. The calculation of diluted earnings per share should not assume conversion, exercise, or other issue of potential ordinary shares that would have an antidilutive effect on earnings per share. *[IAS 33.43]*. The standard gives detailed guidance for determining which potential shares are deemed to be dilutive, and hence brought into the diluted EPS calculation. This guidance covers the element of profit which needs to be diluted to trigger inclusion, and the sequence in which potential shares are tested to establish cumulative dilution. Each is discussed below.

6.3.1 Dilution judged by effect on profits from continuing operations

Potential ordinary shares are only to be treated as dilutive if their conversion to ordinary shares would decrease earnings per share or increase loss per share from continuing operations. The 'control number' that this focuses on is therefore the net result from continuing operations, which is the net profit or loss attributable to the parent entity, after deducting items relating to preference shares (see 5.2 above) and after excluding items relating to discontinued operations. *[IAS 33.42]*. The same denominator is required to be used to compute diluted EPS from continuing operations and total diluted EPS. Determining which potential shares are to be included by reference to their impact on continuing EPS can produce some slightly curious results for total EPS. For example, it is possible to exclude instruments which would dilute basic EPS (but not continuing EPS), and include items which are anti-dilutive as regards total profit. This latter point is acknowledged by the standard as follows.

> 'To illustrate the application of the control number notion ... assume that an entity has profit from continuing operations attributable to the parent entity of CU 4,800, a loss from discontinued operations attributable to the parent entity of (CU 7,200), a loss attributable to the parent entity of (CU 2,400), and 2,000 ordinary shares and 400 potential ordinary shares outstanding. The entity's basic earnings per share is CU 2.40 for continuing operations, (CU 3.60) for discontinued operations and (CU 1.20) for the loss. The 400 potential ordinary shares are included in the diluted earnings per share calculation because the resulting CU 2.00 earnings per share for continuing operations is dilutive, assuming no profit or loss impact of those 400 potential ordinary shares. Because profit from continuing operations attributable to the parent entity is the control number, the entity also includes those 400 potential ordinary shares in the calculation of the other earnings per share amounts, even though the resulting earnings per share amounts are antidilutive to their comparable basic earnings per share amounts, i.e. the loss per share is less [(CU 3.00) per share for the loss from discontinued operations and (CU 1.00) per share for the loss].'
> *[IAS 33.A3]*.

6.3.2 Dilution judged by the cumulative impact of potential shares

Where an entity has a number of different potential ordinary shares, in deciding whether they are dilutive (and hence reflected in the calculation), each issue or series of potential ordinary shares is to be considered in sequence from the most to the least dilutive. Only those potential shares which produce a cumulative dilution are to be included. This means that some potential shares which would dilute basic EPS if viewed on their own may need to be excluded. This results in a diluted EPS showing the maximum overall dilution of basic EPS. The standard observes that options and warrants should generally be included first as they do not affect the numerator in the diluted EPS calculation (but see the discussion at 6.4.2 below). *[IAS 33.44]*. The way this is to be done is illustrated in the following example. *[IAS 33.IE9]*.

Example 37.8: Calculation of weighted average number of shares: determining the order in which to include dilutive instruments

Earnings	$
Profit from continuing operations attributable to the parent entity	16,400,000
Less dividends on preference shares	(6,400,000)
Profit from continuing operations attributable to ordinary equity holders of the parent entity	10,000,000
Loss from discontinued operations attributable to the parent entity	(4,000,000)
Profit attributable to ordinary equity holders of the parent entity	6,000,000

Ordinary shares outstanding	2,000,000
Average market price of one ordinary share during year	$75.00

Potential Ordinary Shares

Options	100,000 with exercise price of $60
Convertible preference shares	800,000 shares with a par value of $100 entitled to a cumulative dividend of $8 per share. Each preference share is convertible to two ordinary shares.
5% convertible bonds	Nominal amount $100,000,000. Each $1,000 bond is convertible to 20 ordinary shares. There is no amortisation of premium or discount affecting the determination of interest expense.
Tax rate	40%

Increase in Earnings Attributable to Ordinary Equity Holders on Conversion of Potential Ordinary Shares

	Increase in earnings $	Increase in number of ordinary shares	Earnings per incremental share $
Options			
Increase in earnings	Nil		
Incremental shares issued for no consideration			
100,000 × ($75 – $60) ÷ $75 =		20,000	Nil
Convertible preference shares			
Increase in earnings			
$800,000 × 100 × 0.08 =	6,400,000		
Incremental shares			
2 × 800,000 =		1,600,000	4.00
5% convertible bonds			
Increase in earnings			
$100,000,000 × 0.05 × (1 – 0.40) =	3,000,000		
Incremental shares			
100,000 × 20 =		2,000,000	1.50

The order in which to include the dilutive instruments is therefore:

(1) Options
(2) 5% convertible bonds
(3) Convertible preference shares

Calculation of Diluted Earnings per Share

	Profit from continuing operations attributable to ordinary equity holders of the parent entity (control number) $	Ordinary shares	Per share $	
As reported	10,000,000	2,000,000	5.00	
Options	–	20,000		
	10,000,000	2,020,000	4.95	Dilutive
5% convertible bonds	3,000,000	2,000,000		
	13,000,000	4,020,000	3.23	Dilutive
Convertible preference shares	6,400,000	1,600,000		
	19,400,000	5,620,000	3.45	Antidilutive

Because diluted earnings per share is increased when taking the convertible preference shares into account (from $3.23 to $3.45), the convertible preference shares are antidilutive and are ignored in the calculation of diluted earnings per share. Therefore, diluted earnings per share for profit from continuing operations is $3.23.

	Basic EPS $		Diluted EPS $	
Profit from continuing operations attributable to ordinary equity holders of the parent entity	5.00		3.23	
Loss from discontinued operations attributable to ordinary equity holders of the parent entity	(2.00)	(a)	(0.99)	(b)
Profit attributable to ordinary equity holders of the parent entity	3.00	(c)	2.24	(d)

(a) ($4,000,000) ÷ 2,000,000 = ($2.00)
(b) ($4,000,000) ÷ 4,020,000 = ($0.99)
(c) $6,000,000 ÷ 2,000,000 = $3.00
(d) ($6,000,000 + $3,000,000) ÷ 4,020,000 = $2.24

This example does not illustrate the classification of the components of convertible financial instruments as liabilities and equity or the classification of related interest and dividends as expenses and equity as required by IAS 32.

6.4 Particular types of dilutive instruments

6.4.1 Convertible instruments

In order to secure a lower rate of interest, entities sometimes attach benefits to loan stock, debentures or preference shares in the form of conversion rights. These permit the holder to convert his holding in whole or part into equity capital. The right is normally exercisable between specified dates. The ultimate conversion of the instrument will have the following effects:

(a) there will be an increase in earnings by the amount of the interest (or items relating to preference shares) no longer payable. As interest is normally allowable for tax purposes, the effect on earnings may be net of a tax deduction relating to some or all of the items; and

(b) the number of ordinary shares in issue will increase. The diluted EPS should be calculated assuming that the instrument is converted into the maximum possible number of shares. *[IAS 33.49]*.

Convertible preference shares will be antidilutive whenever the amount of the dividend on such shares declared in or accumulated for the current period per ordinary share obtainable on conversion exceeds basic earnings per share. Similarly, convertible debt will be antidilutive whenever its interest (net of tax and other changes in income or expense) per ordinary share obtainable on conversion exceeds basic earnings per share. *[IAS 33.50]*.

6.4.1.A Convertible debt

The EPS calculation for convertible bonds is illustrated in the following example: *[IAS 33.IE6]*

Example 37.9: Treatment of convertible bonds in diluted EPS calculations

Profit attributable to ordinary equity holders of the parent entity	$1,004
Ordinary shares outstanding	1,000
Basic earnings per share	$1.00
Convertible bonds	100
Each block of 10 bonds is convertible into three ordinary shares	
Interest expense for the current year relating to the liability component of the convertible bonds	$10
Current and deferred tax relating to that interest expense	$4

Note: the interest expense includes amortisation of the discount arising on initial recognition of the liability component (see IAS 32).

Adjusted profit attributable to ordinary equity holders of the parent entity	$1,004 + $10 – $4 = $1,010
Number of ordinary shares resulting from conversion of bonds	30
Number of ordinary shares used to calculate diluted earnings per share	1,000 + 30 = 1,030
Diluted earnings per share	$1,010 ÷ 1,030 = $0.98

This example does not illustrate the classification of the components of convertible financial instruments as liabilities and equity or the classification of related interest and dividends as expenses and equity as required by IAS 32.

As discussed at 6.2.2 above, the standard also discusses the impact on diluted EPS of different settlement options. As discussed earlier, we believe this should be taken to mean that for diluted EPS purposes earnings should be adjusted to remove any items that arose from an instrument being classified as an asset or liability rather than equity. The standard illustrates settlement options with the following example. *[IAS 33.IE8]*.

Example 37.10: Convertible bonds settled in shares or cash at the issuer's option

An entity issues 2,000 convertible bonds at the beginning of Year 1. The bonds have a three-year term, and are issued at par with a face value of $1,000 per bond, giving total proceeds of $2,000,000. Interest is payable annually in arrears at a nominal annual interest rate of 6 per cent. Each bond is convertible at any time up to maturity into 250 common shares.

When the bonds are issued, the prevailing market interest rate for similar debt without a conversion option is 9 per cent. At the issue date, the market price of one common share is $3. Income tax is ignored.

Profit attributable to ordinary equity holders of the parent entity Year 1	$1,000,000
Ordinary shares outstanding	1,200,000
Convertible bonds outstanding	2,000
Allocation of proceeds of the bond issue:	
Liability component	* $1,848,122
Equity component	$151,878
	$2,000,000

The liability and equity components would be determined in accordance with IAS 32. These amounts are recognised as the initial carrying amounts of the liability and equity components. The amount assigned to the issuer conversion option equity element is an addition to equity and is not adjusted.

* This represents the present value of the principal and interest discounted at 9% – $2,000,000 payable at the end of three years; $120,000 payable annually in arrears for three years.

Basic earnings per share Year 1:

$$\frac{\$1{,}000{,}000}{1{,}200{,}000} = \$0.83 \text{ per ordinary share}$$

Diluted earnings per share Year 1:

It is presumed that the issuer will be required to settle the contract by the issue of ordinary shares. The dilutive effect is therefore calculated in accordance with paragraph 59 of the Standard.

$$\frac{\$1{,}000{,}000 + \$166{,}331^{(a)}}{1{,}200{,}000 + 500{,}000^{(b)}} = \$0.69 \text{ per ordinary share}$$

(a) Profit is adjusted for the accretion of $166,331 ($1,848,122 × 9%) of the liability because of the passage of time.

(b) 500,000 ordinary shares = 250 ordinary shares × 2,000 convertible bonds

6.4.1.B *Convertible preference shares*

The rules for convertible preference shares are very similar to those detailed above in the case of convertible debt, i.e. dividends and other returns to preference shareholders are added back to earnings used for basic EPS and the maximum number of ordinary shares that could be issued on conversion should be used in the calculation.

As discussed at 5.2 above, one possible return to preference shareholders is a premium payable on redemption or induced early conversion in excess of the original terms. IAS 33 notes that the redemption or induced conversion of convertible preference shares may affect only a portion of the previously outstanding convertible preference shares. In such cases, the standard makes clear that any excess consideration is attributed to those shares that are redeemed or converted for the purpose of determining whether the remaining outstanding preference shares are dilutive. In other words, the shares redeemed or converted are considered separately from those shares that are not redeemed or converted. *[IAS 33.51]*.

6.4.1.C *Participating equity instruments and two class shares with conversion rights*

The treatment for basic EPS of participating equity instruments and two class shares is discussed at 5.4 above. When discussing these instruments the standard observes that when calculating diluted EPS:

- conversion is assumed for those instruments that are convertible into ordinary shares if the effect is dilutive;
- for those that are not convertible into a class of ordinary shares, profit or loss for the period is allocated to the different classes of shares and participating equity instruments in accordance with their dividend rights or other rights to participate in undistributed earnings. *[IAS 33.A14]*.

What the standard seems to be hinting at here, without directly addressing, is how to present EPS for two or more classes of ordinary shares (say, class A and class B) when one class can convert into another (say, class B can convert into class A). In this scenario, in our view the basic EPS for each class should be calculated based on profit entitlement (see 5.4 above). For diluted EPS it would be necessary to attribute to class A the profits attributed to class B in the basic EPS – if the overall effect were dilutive to class A, conversion should be assumed.

6.4.2 Options, warrants and their equivalents

6.4.2.A The numerator

IAS 33 contains detailed guidance on the treatment for diluted EPS purposes of options, warrants and their equivalents which it defines as 'financial instruments that give the holder the right to purchase ordinary shares'. *[IAS 33.5]*. However, it was largely written before the significant developments in accounting for such instruments (IFRS 2 and IAS 32). As a result, individual facts and circumstances must be considered and judgment is required in some circumstances to address the dilutive effects on EPS.

IAS 33 clearly states that 'Options and warrants ... do not affect the numerator of the calculation' *[IAS 33.44]* and this text was added in 2003 as part of the improvements project, so clearly drafted against the back drop of the impending move to expensing share-based payments and also the (then) recent changes to IAS 32 regarding accounting for derivatives over an entity's own shares. As regards employee share options in particular, neither IAS 33 (as updated by IFRS 2) nor the worked example appended to it (see Example 37.13 at 6.4.5 below) make reference to removing either some or all the charge when computing diluted EPS. However, this seems to sit somewhat awkwardly (particularly for options outside the scope of IFRS 2) with the general requirement for calculating diluted EPS that earnings be adjusted for the effects of 'any other changes in income or expense that would result from the conversion of the dilutive potential ordinary shares'. *[IAS 33.33]*. Furthermore, IAS 33 explicitly requires an adjustment to the numerator in some circumstances:

(a) as discussed at 6.2.2 above, adjustment to the numerator may be required for a contract (which could include options and warrants) that may be settled in ordinary shares or cash at the entity's option when such a contract is presented for accounting purposes as an asset or a liability, or has an equity component and a liability component. In such a case, the standard requires that 'the entity shall adjust the numerator for any changes in profit or loss that would have resulted during the period if the contract had been classified wholly as an equity instrument'. For contracts that may be settled in ordinary shares or cash at the holder's option, 'the more dilutive of cash settlement and share settlement shall be used in calculating diluted earnings per share'; *[IAS 33.59-60]*

(b) where an option agreement requires or permits the tendering of debt in payment of the exercise price (and, if the holder could choose to pay cash, that tendering debt is more advantageous to him) the numerator should be adjusted for the after tax amount of any such debt assumed to be tendered (see 6.4.2.E below); *[IAS 33.A7]* and

(c) where option proceeds are required to be applied to redeem debt or other instruments of the entity (see 6.4.2.F below). *[IAS 33.A9]*.

For situations covered by (b) and (c) above the specific requirements of the standard for adjusting the numerator should be followed. In other circumstances, the interaction of these complex and conflicting requirements with each other and with IFRS 2 and IAS 32 lead to the following requirements when computing the numerator for diluted EPS:

(a) for instruments accounted for under IAS 32:
    (i) for a contract classified wholly as an equity instrument, no adjustment to the numerator will be necessary; and
    (ii) for a contract not classified wholly as an equity instrument, the numerator should be adjusted for any changes in profit or loss that would have resulted if it had been classified wholly as an equity instrument; and
(b) for instruments accounted for under IFRS 2:
    (i) for those treated as equity-settled, the IFRS 2 charge should not be adjusted for; and
    (ii) for those treated as cash-settled, the numerator should be adjusted for any changes in profit or loss that would have resulted if the instrument had been classified wholly as an equity instrument.

In respect of (b), part (i) is supported by the IASB's view regarding share-based payments as follows.

'Some argue that any cost arising from share-based payment transactions is already recognised in the dilution of earnings per share (EPS). If an expense were recognised in the income statement, EPS would be "hit twice".

'However, the Board noted that this result is appropriate. For example, if the entity paid the employees in cash for their services and the cash was then returned to the entity, as consideration for the issue of share options, the effect on EPS would be the same as issuing those options direct to the employees.

'The dual effect on EPS simply reflects the two economic events that have occurred: the entity has issued shares or share options, thereby increasing the number of shares included in the EPS calculation – although, in the case of options, only to the extent that the options are regarded as dilutive – and it has also consumed the resources it received for those options, thereby decreasing earnings. ...

'In summary, the Board concluded that the dual effect on diluted EPS is not double-counting the effects of a share or share option grant – the same effect is not counted twice. Rather, two different effects are each counted once.' *[IFRS 2.BC54-BC57]*.

As for part (ii) of (b) above, this is the explicit requirement of IAS 33 when the entity can choose cash or share settlement. It is also implicit in the requirement of the standard that for contracts that may be settled in ordinary shares or cash at the holder's option, the more dilutive of cash settlement and share settlement should be used in calculating diluted earnings per share. This would also explain why IFRS 2 requires the computation of grant date fair values for cash-settled share-based payments when that information is not actually required for accounting purposes (see Chapter 34 at 9.3.2).

6.4.2.B Written call options

Entities may issue options or warrants which give holders the right to subscribe for shares at fixed prices on specified future dates. If the options or warrants are exercised then:

(a) the number of shares in issue will be increased; and

(b) funds will flow into the company and these will produce income.

For calculating diluted EPS, IAS 33 requires the exercise of all dilutive options and warrants to be assumed. *[IAS 33.45]*. Options and warrants are considered dilutive when they would result in the issue of ordinary shares for less than the average market price of ordinary shares during the period. The amount of the dilution is taken to be the average market price of ordinary shares during the period minus the issue price. *[IAS 33.46]*.

Under IAS 33 the effects of such potential ordinary shares on the diluted EPS are reflected in the computation of the denominator using a method sometimes called the 'treasury stock method'.

For this purpose, the weighted average number of shares used in calculating the basic EPS is increased, but not by the full number of shares that would be issued on exercise of the instruments. To determine how many additional shares to include in the denominator, the assumed proceeds from these issues are to be treated as having been received in exchange for:

- a certain number of shares at their average market price for the period (i.e. no EPS impact); and
- the remainder for no consideration (i.e. full dilution). *[IAS 33.45-46]*.

This means that the excess of the total number of potential shares over the number that could be issued at their average market price for the period out of the issue proceeds is included within the denominator; the calculation is illustrated as follows: *[IAS 33.IE5]*

Example 37.11: Effects of share options on diluted earnings per share

Profit attributable to ordinary equity holders of the parent entity for year	₹1,200,000
Weighted average number of ordinary shares outstanding during year	500,000 shares
Average market price of one ordinary share during year	₹20.00
Weighted average number of shares under option during year	100,000 shares
Exercise price for shares under option during year	₹15.00

Calculation of earnings per share

	Earnings	*Shares*	*Per share*
Profit attributable to ordinary equity holders of the parent entity for year	₹1,200,000		
Weighted average shares outstanding during year		500,000	
Basic earnings per share			₹2.40
Weighted average number of shares under option		100,000	
Weighted average number of shares that would have been issued at average market price: (100,000 × ₹15.00) ÷ ₹20.00	*	(75,000)	
Diluted earnings per share	₹1,200,000	525,000	₹2.29

* Earnings have not increased because the total number of shares has increased only by the number of shares (25,000) deemed to have been issued for no consideration.

The number of shares viewed as fairly priced (and hence neither dilutive nor antidilutive) for this purpose is calculated on the basis of the average price of the ordinary shares during the reporting period. *[IAS 33.46]*. The standard observes that, in theory, calculating an average share price for the period could include every market transaction in the shares. However, it notes that as a practical matter an average (weekly or monthly) will usually be adequate. *[IAS 33.A4]*. The individual prices used should generally be the closing market price unless prices fluctuate widely, in which case the average of high and low prices may be more representative. Whatever method is adopted, it should be used consistently unless it ceases to yield a representative price. For example, closing prices may have been used consistently in a series of relatively stable periods then a change to high/low average could be appropriate when prices begin to fluctuate more widely. *[IAS 33.A5]*.

The shares would be deemed to have been issued at the beginning of the period or, if later, the date of issue of the warrants or options. Options which are exercised or lapse in the period are included for the portion of the period during which they were outstanding. *[IAS 33.36, 38]*.

Although the standard seems to require that the fair value used should be the average for the reporting period for all outstanding options or warrants, in our view, for instruments issued, lapsed or exercised during the period a credible case could be made for using an average price for that part of the reporting period that the instrument was outstanding. Indeed, this view is supported by the comprehensive example included in the standard (see the appendix to this chapter), where in computing the number of warrants to be included in calculating the diluted EPS for the full year, the average price used was not that for the full year, but only for the period that the warrants were outstanding.

One practical problem with this requirement is that the average market price of ordinary shares for the reporting period may not be available. Examples would include an entity only listed for part of the period, or an unlisted entity giving voluntary disclosures. In such cases estimates of the market price would need to be made.

6.4.2.C Written put options and forward purchase agreements

Contracts that require the entity to repurchase its own shares, such as written put options and forward purchase contracts, should be reflected in the calculation of diluted earnings per share if the effect is dilutive. If these contracts are 'in the money' during the period (i.e. the exercise or settlement price is above the average market price for that period), IAS 33 requires the potential dilutive effect on EPS to be calculated as follows:

- it should be assumed that at the beginning of the period sufficient ordinary shares are issued (at the average market price during the period) to raise proceeds to satisfy the contract;
- the proceeds from the issue are then assumed to be used to satisfy the contract (i.e. to buy back ordinary shares); and
- the incremental ordinary shares (the difference between the number of ordinary shares assumed issued and the number of ordinary shares received from satisfying the contract) should be included in the calculation of diluted earnings per share. *[IAS 33.63]*.

The standard illustrates this methodology as follows: '... assume that an entity has outstanding 120 written put options on its ordinary shares with an exercise price of CU 35. The average market price of its ordinary shares for the period is CU 28. In calculating diluted earnings per share, the entity assumes that it issued 150 shares at CU 28 per share at the beginning of the period to satisfy its put obligation of CU 4,200. The difference between the 150 ordinary shares issued and the 120 ordinary shares received from satisfying the put option (30 incremental ordinary shares) is added to the denominator in calculating diluted earnings per share.' *[IAS 33.A10]*.

6.4.2.D Options over convertible instruments

Although not common, it is possible that an entity grants options or warrants to acquire not ordinary shares directly but other instruments convertible into them (such as convertible preference shares or debt). In this scenario, IAS 33 sets a dual test:

- exercise is assumed whenever the average prices of both the convertible instrument and the ordinary shares obtainable upon conversion are above the exercise price of the options or warrants; but
- exercise is not assumed unless conversion of similar outstanding convertible instruments, if any, is also assumed. *[IAS 33.A6]*.

6.4.2.E Settlement of option exercise price with debt or other instruments of the entity

The standard notes that options or warrants may permit or require the tendering of debt or other instruments of the entity (or its parent or a subsidiary) in payment of all or a portion of the exercise price. In the calculation of diluted earnings per share, those options or warrants have a dilutive effect if (a) the average market price of the related ordinary shares for the period exceeds the exercise price or (b) the selling price of the instrument to be tendered is below that at which the instrument may be tendered under the option or warrant agreement and the resulting discount establishes an effective exercise price below the market price of the ordinary shares obtainable upon exercise. In the calculation of diluted EPS, those options or warrants should be assumed to be exercised and the debt or other instruments assumed to be tendered. If tendering cash is more advantageous to the option or warrant holder and the contract permits it, tendering of cash should be assumed. Interest (net of tax) on any debt assumed to be tendered is added back as an adjustment to the numerator. *[IAS 33.A7]*.

Similar treatment is given to preference shares that have similar provisions or to other instruments that have conversion options that permit the investor to pay cash for a more favourable conversion rate. *[IAS 33.A8]*.

6.4.2.F Specified application of option proceeds

IAS 33 observes that the underlying terms of certain options or warrants may require the proceeds received from the exercise of those instruments to be applied to redeem debt or other instruments of the entity (or its parent or a subsidiary). In which case it requires that in 'the calculation of diluted earnings per share, those options or warrants are assumed to be exercised and the proceeds applied to purchase the debt at its average market price rather than to purchase ordinary shares. However, the excess proceeds received from the assumed exercise over the amount used for the assumed purchase of debt are considered (i.e. assumed to be used to buy back ordinary shares) in the diluted earnings per share calculation. Interest (net of tax) on any debt assumed to be purchased is added back as an adjustment to the numerator.' *[IAS 33.A9]*.

6.4.3 *Purchased options and warrants*

IAS 33 states that a holding by an entity of options over its own shares will always be antidilutive because:

- put options would only be exercised if the exercise price were higher than the market price; and
- call options would only be exercised if the exercise price were lower than the market price.

Accordingly, the standard requires that such instruments are not included in the calculation of diluted EPS. *[IAS 33.62]*.

However, depending upon the settlement mechanism and the share price at the beginning and end of the period, the option could have resulted in a gain being reported (see Chapter 47 at 5). It is therefore possible that the removal of any such gain from the numerator could have a greater dilutive effect than the reduction in the denominator and hence render the option dilutive. In that circumstance, the option should be included in the diluted EPS calculation.

6.4.4 *Partly paid shares*

As noted at 3.2 above, shares issued in partly paid form are to be included in the basic EPS as a fraction of a share, based on dividend participation. As regards diluted EPS they are to be treated, to the extent that they are not entitled to participate in dividends, as the equivalent of options or warrants. The unpaid balance is assumed to represent proceeds used to purchase ordinary shares. The number of shares included in diluted earnings per share is the difference between the number of shares subscribed and the number of shares assumed to be purchased. *[IAS 33.A16]*. The mechanics of this treatment are not further spelt out in the standard, but the phrase 'treated as a fraction of an ordinary share' is not repeated. Instead, it is 'the number of shares subscribed' which the standard says should be compared to the number assumed purchased to measure dilution. However, 'the number of shares subscribed' is not defined. Whilst this could be read to mean that the remaining unpaid consideration is to be treated as the exercise price for options over all of the shares issued in partly paid form, we believe the better interpretation is that the unpaid capital should be viewed as the exercise price for options over the proportion of the shares not reflected in the basic EPS. This would mean that if the average share price for the period were the same as the total issue price, then no dilution would be reported. Furthermore, an issue of partly paid shares, say 50% paid with 50% dividend entitlement is economically identical to an issue of half the quantity as fully paid (with full dividend entitlement) and a forward contract for the remaining half. In that scenario, the issued shares would be incorporated into the basic and diluted EPS in full from the date of issue. The forward contract would be included in diluted EPS calculation by comparing the contracted number of shares with the number of shares that could be bought out of proceeds based on the average share price for the period. In our view, these economically identical transactions should produce the same diluted EPS – that would be achieved by interpreting 'the number of shares subscribed' as the number economically subscribed, i.e. the proportion of part-paid shares not already included in basic EPS.

An illustration of what the calculation would look like is as follows:

Example 37.12: Partly paid shares

Capital structure

Issued share capital as at 31 December 2020:
2,000,000 ordinary shares of 10c each

Issued on 1 January 2021:
500,000 part paid ordinary shares of 10c each. Full consideration of 50c per share (being fair value at 1 January 2021) paid up 50% on issue. Dividend participation 50% until fully paid. New shares remain part paid at 31 December 2021.

Average fair value of one ordinary share for the period 60c.

Trading results

Net profit attributable to ordinary shareholders for the year ended 31 December 2021: $100,000.

Computation of basic and diluted EPS

	Net profit attributable to ordinary shareholders $	*Ordinary shares* No.	*Per share*
Fully paid shares		2,000,000	
Partly paid shares (1)		250,000	
Basic EPS	100,000	2,250,000	4.44c
Dilutive effect of partly paid shares (2)		41,667	
Diluted EPS	100,000	2,291,667	4.36c

(1) 50% dividend rights for 500,000 shares.

(2) Outstanding consideration of $125,000 (500,000 × 25c), using fair value of 60c this equates to 208,333 shares, hence the number of dilutive shares deemed issued for free is 41,667 (250,000 – 208,333).

The example assumes the fair value of the shares over the year is higher than the issue price, which explains why some extra shares are included in the diluted EPS. If the average fair value remained at the issue price of 50c then no additional shares would be included for diluted EPS.

6.4.5 Share-based payments

Share options and other incentive schemes are a common feature of employee remuneration, and can come in many forms. For diluted EPS purposes, IAS 33 identifies two categories and specifies the diluted EPS treatment for each. The categories are:

(a) performance-based employee share options; and

(b) employee share options with fixed or determinable terms and non-vested ordinary shares. *[IAS 33.48]*.

Before moving on to the diluted EPS treatment, it is worth noting an issue that arises from the way IAS 33 phrases this categorisation and subsequent guidance. Although not clearly stated in the standard, we believe all schemes should be treated as either category (a) or category (b). Any arrangements where entitlement is subject to future performance would fall into category (a) with category (b) being the default for all other arrangements.

Schemes in the first category are to be treated as contingently issuable shares (see 6.4.6 below) because their issue is contingent upon satisfying specified conditions in addition to the passage of time. *[IAS 33.48]*.

Those in the second category are to be treated as options (see 6.4.2 above). They should be regarded as outstanding from the grant date, even if they vest, and hence can be realised by the employees, at some later date. *[IAS 33.48]*. An example would be an unexpired loyalty period. This means that some shares may be included in diluted EPS which never, in fact, get issued to employees because they fail to remain with the company for this period. Furthermore, for share options and other share-based payment arrangements to which IFRS 2 applies, the proceeds figure to be used in calculating the dilution under such schemes should include the fair value (as determined in accordance with IFRS 2) of any goods or services to be supplied to the entity in the future under the arrangement. *[IAS 33.47A]*. An example illustrating the latter point is as follows: *[IAS 33.IE5A]*

Example 37.13: Determining the exercise price of employee share options

Weighted average number of unvested share options per employee	1,000
Weighted average amount per employee to be recognised over the remainder of the vesting period for employee services to be rendered as consideration for the share options, determined in accordance with IFRS 2	£1,200.00
Cash exercise price of unvested share options	£15.00
Calculation of adjusted exercise price	
Fair value of services yet to be rendered per employee:	£1,200.00
Fair value of services yet to be rendered per option: (£1,200 ÷ 1,000)	£1.20
Total exercise price of share options: (£15.00 + £1.20)	£16.20

Whilst the standard requires that the additional deemed proceeds is the fair value of goods or services yet to be received, the example clarifies that it is the IFRS 2 expense yet to be charged to income.

What this requirement seeks to reflect is that for such options the issuer will receive not just the cash proceeds (if any) under the option when it is exercised but also valuable goods and services over its life. This will result in the dilutive effect of the options increasing over time as the deemed proceeds on exercise of the options reduces.

6.4.6 *Contingently issuable shares*

IAS 33 contains considerable detailed guidance, including a numerical worked example, on contingently issuable shares. Contingently issuable ordinary shares are defined as 'ordinary shares issuable for little or no cash or other consideration upon satisfaction of specified conditions in a contingent share agreement.' A contingent share agreement is defined by the standard as 'an agreement to issue shares that is dependent on the satisfaction of specified conditions.' *[IAS 33.5]*. The basic rule is that the number of contingently issuable shares to be included in the diluted EPS calculation is 'based on the number of shares that would be issuable if the end of the period were the end of the contingency period'. *[IAS 33.52]*. This requirement to look at the status of the contingency at the end of the reporting period, rather than to consider the most likely outcome, seems to have the overall result of reducing the amount of dilution disclosed.

The discussions in the standard cover three broad categories: earnings-based contingencies, share price-based contingencies, and other contingencies. These are discussed in turn below.

The number of shares contingently issuable may depend on future earnings and future prices of the ordinary shares. In such cases, the standard makes clear that the number of shares included in the diluted EPS calculation is based on both conditions (i.e. earnings to date and the current market price at the end of the reporting period). In other words, contingently issuable shares are not included in the diluted EPS calculation unless both conditions are met. *[IAS 33.55]*.

6.4.6.A Earnings-based contingencies

The standard discusses the scenario where shares would be issued contingent upon the attainment or maintenance of a specified amount of earnings for a period. In such a case the standard requires that 'if that amount has been attained at the end of the reporting period but must be maintained beyond the end of the reporting period for an additional period, then the additional ordinary shares are treated as outstanding, if the effect is dilutive, when calculating diluted earnings per share. In that case, the calculation of diluted earnings per share is based on the number of ordinary shares that would be issued if the amount of earnings at the end of the reporting period were the amount of earnings at the end of the contingency period'. *[IAS 33.53]*. As a result, earnings-based contingencies need to be viewed as an absolute cumulative hurdle which either is met or not met at the reporting date. Often, such contingencies may be contractually expressed in terms of annual performance over a number of years, say an average of $1million profit per year for three years. In our view, 'the attainment or maintenance of a specified amount of earnings for a period' in this scenario would mean generating a total of $3million of profits. If that is achieved by the end of a reporting period, the shares are outstanding for diluted EPS purposes and included in the computation if the effect is dilutive. It could, perhaps, be argued that the potential shares should be considered outstanding if profits of $1million were generated at the end of the first year. However, the requirement that the calculation be 'based on the number of ordinary shares that would be issued if the amount of earnings at the end of the reporting period were the amount of earnings at the end of the contingency period' means that the test must be: would shares be issued if the current earnings of $1million were all the profits earned by the end of the three year contingency period? In this example the answer is no, as that amount of earnings would fall short of averaging $1million per year. The standard then notes that, because earnings may change in a future period, the calculation of basic EPS does not include such contingently issuable shares until the end of the contingency period because not all necessary conditions have been satisfied. *[IAS 33.53]*.

An earnings-based contingency is illustrated in the following example: *[IAS 33.IE7]*

Example 37.14: Contingently issuable shares

Ordinary shares outstanding during 2021:	1,000,000 (there were no options, warrants or convertible instruments outstanding during the period)
An agreement related to a recent business combination provides for the issue of additional ordinary shares based on the following conditions:	5,000 additional ordinary shares for each new retail site opened during 2021 1,000 additional ordinary shares for each $1,000 of consolidated profit in excess of $2,000,000 for the year ended 31 December 2021
Retail sites opened during the year:	one on 1 May 2021 one on 1 September 2021
Consolidated year-to-date profit attributable to ordinary equity holders of the parent entity:	$1,100,000 as of 31 March 2021 $2,300,000 as of 30 June 2021 $1,900,000 as of 30 September 2021 (including a $450,000 loss from a discontinued operation) $2,900,000 as of 31 December 2021

Basic earnings per share	*First quarter*	*Second quarter*	*Third quarter*	*Fourth quarter*	*Full year*
Numerator ($)	1,100,000	1,200,000	(400,000)	1,000,000	2,900,000
Denominator:					
Ordinary shares outstanding	1,000,000	1,000,000	1,000,000	1,000,000	1,000,000
Retail site contingency	–	3,333 (a)	6,667 (b)	10,000	5,000 (c)
Earnings contingency (d)	–	–	–	–	–
Total shares	1,000,000	1,003,333	1,006,667	1,010,000	1,005,000
Basic earnings per share ($)	1.10	1.20	(0.40)	0.99	2.89

(a) 5,000 shares × 2/3

(b) 5,000 shares + (5,000 shares × 1/3)

(c) (5,000 shares × 8/12) + (5,000 shares × 4/12)

(d) The earnings contingency has no effect on basic earnings per share because it is not certain that the condition is satisfied until the end of the contingency period. The effect is negligible for the fourth-quarter and full-year calculations because it is not certain that the condition is met until the last day of the period.

Diluted earnings per share	*First quarter*	*Second quarter*	*Third quarter*	*Fourth quarter*	*Full year*
Numerator ($)	1,100,000	1,200,000	(400,000)	1,000,000	2,900,000
Denominator:					
Ordinary shares outstanding	1,000,000	1,000,000	1,000,000	1,000,000	1,000,000
Retail site contingency	–	5,000	10,000	10,000	10,000
Earnings contingency	– (e)	300,000 (f)	– (g)	900,000 (h)	900,000 (h)
Total shares	1,000,000	1,305,000	1,010,000	1,910,000	1,910,000
Diluted earnings per share ($)	1.10	0.92	(0.40) (i)	0.52	1.52

(e) Year-to-date profits do not exceed $2,000,000 at 31 March 2021. The Standard does not permit projecting future earnings levels and including the related contingent shares.

(f) [($2,300,000 – $2,000,000) ÷ 1,000] × 1,000 shares = 300,000 shares.

(g) Year-to-date profit is less than $2,000,000.

(h) [($2,900,000 – $2,000,000) ÷ 1,000] × 1,000 shares = 900,000 shares.

(i) Because the loss during the third quarter is attributable to a loss from a discontinued operation, the antidilution rules do not apply. The control number (i.e. profit or loss from continuing operations attributable to the equity holders of the parent entity) is positive. Accordingly, the effect of potential ordinary shares is included in the calculation of diluted earnings per share.

This example from IAS 33 illustrates quarterly financial reporting. However, the principles are the same whether the reporting period is illustrated as three months or one year. The example does illustrate that the earnings target is a cumulative hurdle over the entire contingency period (four reporting periods in the example) rather than including potential shares based on the assumption that the level of quarterly profit would be maintained for the four quarters.

The standard only discusses earnings criteria based on absolute measures; in the example above a cumulative profit in excess of $2,000,000. In our experience such criteria are rare. In practice criteria are often phrased in terms of relative performance against an external benchmark. Examples would be earnings growth targets of inflation plus 2% or EPS growth being in the top quartile of a group of competitors. For contingencies such as these it is impossible to establish an absolute target in order to ask whether it is met at the period end. For example, consider the earnings contingency in IAS 33, discussed above, to achieve profits in excess of $2,000,000 over four quarters. If this instead required the profits to be $2,000,000 adjusted in line with inflation, it would be impossible to know how many shares would be issued if the cumulative profit at the end of the second quarter of $2,300,000 were the amount of earnings at the end of the contingency period. Until the end of the year the absolute level of profit required would be unknown; it would be more or less than $2,000,000 depending on the level of inflation or deflation over the period.

There would seem to be (at least) two different ways of interpreting the requirements of IAS 33 in such a scenario, each resulting in a different diluted EPS figure. One approach would be to consider such criteria as being based on 'a condition other than earnings or market price'. That would mean (as discussed at 6.4.6.C below) that the number of shares brought into diluted EPS would be based on the status of the condition at the end of the reporting period. *[IAS 33.56]*. If the target was earnings for the year in excess of $2,000,000 adjusted in line with inflation and at the end of the second quarter inflation had been 4%, then the target would become $2,080,000 and hence 220,000 shares would be included for diluted EPS for the second quarter. An alternative approach would be to regard it as an earnings-based contingency and make an assumption as to future inflation over the contingency period. This would allow a cumulative hurdle to be calculated and compared with actual earnings to date. If at the end of the second quarter it was estimated that the annual inflation for the year was 5%, then the target would become $2,100,000 and hence 200,000 shares would be included for diluted EPS for the second quarter. Given the lack of clarity in the standard, it seems likely that either of the above approaches may be selected in practice.

6.4.6.B Share price-based contingencies

The provisions here are more straightforward. In these cases, if the effect is dilutive, the calculation of diluted EPS is based on the number of shares that would be issued if the market price at the end of the reporting period were the market price at the end of the contingency period. If the condition is based on an average of market prices over a period of time that extends beyond the end of the reporting period, the average for the period of time that has lapsed should be used. Again the standard explains that, because the market price may change in a future period, the calculation of basic earnings per share does not include such contingently issuable ordinary shares until the end of the contingency period because not all necessary conditions have been satisfied. *[IAS 33.54]*.

6.4.6.C Other contingencies

The requirement regarding contingencies not driven by earnings or share price is as follows: 'assuming that the present status of the condition remains unchanged until the end of the contingency period, the contingently issuable ordinary shares are included in the calculation of diluted earnings per share according to the status at the end of the reporting period.' *[IAS 33.56]*.

The standard illustrates the 'other contingency' rules by the example of shares being issued depending upon the opening of a specified number of retail sites, and such a contingency is included in the numerical example in the standard (see Example 37.14 at 6.4.6.A above). As is the case for earnings-based contingencies discussed above, it would seem that such conditions are always deemed to be expressed as a cumulative hurdle which may or may not be met by the end of the reporting period. Accordingly, the required treatment would be the same if the condition had been expressed in terms of achieving a certain average annual level of shop openings.

6.4.7 Potential ordinary shares of investees

A subsidiary, joint venture or associate may issue to parties other than the parent or investors with joint control of, or significant influence over the investee potential ordinary shares that are convertible into either ordinary shares of the subsidiary, joint venture or associate, or ordinary shares of the parent or investors with joint control of, or significant influence over the investee (the reporting entity). If these potential ordinary shares of the subsidiary, joint venture or associate have a dilutive effect on the basic EPS of the reporting entity, they should be included in the calculation of diluted earnings per share. *[IAS 33.40]*.

The standard requires that such potential ordinary shares should be included in the calculation of diluted EPS as follows:

(a) instruments issued by a subsidiary, joint venture or associate that enable their holders to obtain ordinary shares of the subsidiary, joint venture or associate should be included in calculating the diluted EPS data of the subsidiary, joint venture or associate. Those EPS are then included in the reporting entity's EPS calculations based on the reporting entity's holding of the instruments of the subsidiary, joint venture or associate; and

(b) instruments of a subsidiary, joint venture or associate that are convertible into the reporting entity's ordinary shares should be considered among the potential ordinary shares of the reporting entity for the purpose of calculating diluted EPS. Similarly, options or warrants issued by a subsidiary, joint venture or associate to purchase ordinary shares of the reporting entity should be considered among the potential ordinary shares of the reporting entity in the calculation of consolidated diluted EPS. *[IAS 33.A11]*.

For the purpose of determining the EPS effect of instruments issued by a reporting entity that are convertible into ordinary shares of a subsidiary, joint venture or associate, the standard requires that the instruments are assumed to be converted and the numerator (profit or loss attributable to ordinary equity holders of the parent entity) adjusted as necessary in accordance with the normal rules (see 6.2.1 above). In addition to those adjustments, the numerator is adjusted for any change in the profit or loss recorded by the reporting entity (such as dividend income or equity method income) that is attributable to the increase in the number of ordinary shares of the subsidiary, joint venture or associate outstanding as a result of the assumed conversion. The denominator of the diluted EPS calculation is not affected because the number of ordinary shares of the reporting entity outstanding would not change upon assumed conversion. *[IAS 33.A12]*.

The computation under (a) above is illustrated in the following example. *[IAS 33.IE10]*.

Example 37.15: Warrants issued by a subsidiary

Parent:

Profit attributable to ordinary equity holders of the parent entity	$12,000 (excluding any earnings of, or dividends paid by, the subsidiary)
Ordinary shares outstanding	10,000
Instruments of subsidiary owned by the parent	800 ordinary shares 30 warrants exercisable to purchase ordinary shares of subsidiary 300 convertible preference shares

Subsidiary:

Profit	$5,400
Ordinary shares outstanding	1,000
Warrants	150, exercisable to purchase ordinary shares of the subsidiary
Exercise price	$10
Average market price of one ordinary share	$20
Convertible preference shares	400, each convertible into one ordinary share
Dividends on preference shares	$1 per share

No inter-company eliminations or adjustments were necessary except for dividends.
For the purposes of this illustration, income taxes have been ignored.

Subsidiary's earnings per share

Basic EPS	$5.00	calculated:	$\dfrac{\$5{,}400^{(a)} - \$400^{(b)}}{1{,}000^{(c)}}$
Diluted EPS	$3.66	calculated:	$\dfrac{\$5{,}400^{(d)}}{1{,}000 + 75^{(e)} + 400^{(f)}}$

(a) Subsidiary's profit.
(b) Dividends paid by subsidiary on convertible preference shares.
(c) Subsidiary's ordinary shares outstanding.
(d) Subsidiary's profit attributable to ordinary equity holders ($5,000) increased by $400 preference dividends for the purpose of calculating diluted earnings per share.
(e) Incremental shares from warrants, calculated: [($20 – $10) ÷ $20] × 150.
(f) Subsidiary's ordinary shares assumed outstanding from conversion of convertible preference shares, calculated: 400 convertible preference shares × conversion factor of 1.

Consolidated earnings per share

Basic EPS	$1.63	calculated:	$\dfrac{\$12{,}000^{(g)} - \$4{,}300^{(h)}}{10{,}000^{(i)}}$
Diluted EPS	$1.61	calculated:	$\dfrac{\$12{,}000 + \$2{,}928^{(j)} + \$55^{(k)} + \$1{,}098^{(l)}}{10{,}000}$

(g) Parent's profit attributable to ordinary equity holders of the parent entity.
(h) Portion of subsidiary's profit to be included in consolidated basic earnings per share, calculated: (800 × $5.00) + (300 × $1.00)
(i) Parent's ordinary shares outstanding.
(j) Parent's proportionate interest in subsidiary's earnings attributable to ordinary shares, calculated: (800 ÷ 1,000) × (1,000 shares × $3.66 per share)

(k) Parent's proportionate interest in subsidiary's earnings attributable to warrants, calculated: (30 ÷ 150) × (75 incremental shares × $3.66 per share)

(l) Parent's proportionate interest in subsidiary's earnings attributable to convertible preference shares, calculated: (300 ÷ 400) × (400 shares from conversion × $3.66 per share)

This example does not illustrate the classification of the components of convertible financial instruments as liabilities and equity or the classification of related interest and dividends as expenses and equity as required by IAS 32.

6.4.8 Contingently issuable potential ordinary shares

The standard requires that contingently issuable potential ordinary shares (other than those covered by a contingent share agreement, such as contingently issuable convertible instruments) to be included in the diluted EPS calculation as follows:

(a) determine whether the potential ordinary shares may be assumed to be issuable on the basis of the conditions specified for their issue in accordance with the provisions of the standard for contingent ordinary shares (see 6.4.6 above); and

(b) if those potential ordinary shares should be reflected in diluted EPS, determine their impact on the calculation of diluted earnings per share by following the provisions of the standard for that type of potential ordinary share.

However, exercise or conversion is not to be assumed for the purpose of calculating diluted earnings per share unless exercise or conversion of similar outstanding potential ordinary shares that are not contingently issuable is assumed. *[IAS 33.57]*.

7 PRESENTATION, RESTATEMENT AND DISCLOSURE

7.1 Presentation

As discussed in Chapter 3 at 3.2.1, IAS 1 requires that all items of income and expense be presented either:

(a) in a single statement of profit or loss and comprehensive income; or

(b) in two separate statements:

  (i) a statement of profit or loss; and

  (ii) a statement, beginning with profit or loss, presenting items of other comprehensive income. *[IAS 1.10A]*.

If the approach in (b) is followed, the separate statement of profit or loss must be displayed immediately before the statement of comprehensive income. *[IAS 1.10A]*.

If (a) is adopted, the EPS presentational requirements below apply to that single statement. If (b) is chosen, the requirements apply to the separate statement of profit or loss only and not the separate statement of comprehensive income. *[IAS 33.4A, 67A, 68A]*.

IAS 33 requires the presentation of basic and diluted EPS (with equal prominence and even if the amounts are negative – i.e. a loss per share) for each period for which a statement of comprehensive income (or separate income statement) is presented. *[IAS 33.66, 69]*. This is required for the profit or loss attributable to ordinary equity holders for:

(a) overall profit;

(b) profit or loss from continuing operations; and

(c) profit or loss from discontinued operations, if any. *[IAS 33.66, 68]*.

In the case of (a) and (b), separate figures are required for each class of ordinary shares with a different right to share in profits for the period. The figures for (a) and (b) must be displayed on the face of the statement. *[IAS 33.66]*. Those for (c) may be either on the face or in the notes. *[IAS 33.68]*. The standard states that if diluted EPS is given for at least one period it must be given for all periods presented. IAS 33 notes that if basic and diluted EPS are equal, dual presentation can be accomplished in one line in the statement. *[IAS 33.67]*.

Regarding (c), the wording of the standard is not very clear. In particular, if an entity has more than one discontinued operation it does not specify whether separate EPS disclosures are required for each or whether one aggregate figure is needed. The wording leans to the former, as it uses the singular – 'An entity that reports a discontinued operation shall disclose the basic and diluted amounts per share for the discontinued operation ...'. However, IFRS 5 – *Non-current Assets Held for Sale and Discontinued Operations* – only requires the statement of comprehensive income (or separate income statement) to identify the total result from all discontinued operations. *[IFRS 5.33]*. In light of this, we believe aggregate figures are acceptable.

The presentation of EPS data in addition to that required by IAS 33 is discussed at 5.5 above.

7.2 Restatement

IAS 33 contains requirements to restate prior periods' EPS for events that change the number of shares outstanding without a corresponding change in resources. Additionally it specifies circumstances when EPS should not be restated.

Basic and diluted EPS for all periods presented should be adjusted for:

- events (other than the conversion of potential ordinary shares) which change the number of ordinary shares without a corresponding change in resources (discussed at 4.3 above); *[IAS 33.26, 64]*
- the effects of errors and adjustments resulting from changes in accounting policies accounted for retrospectively (see 5.3 above); *[IAS 33.64]* and
- the effects of group reorganisations that are accounted for as a pooling of interests (discussed at 4.6 above).

No adjustment should be made:

- to basic or diluted EPS when a share consolidation is combined with a special dividend where the overall commercial effect is that of a share repurchase at fair value (discussed at 4.3.2 above); *[IAS 33.29]*
- to previously reported diluted EPS due to changes in the prices of ordinary shares which would have given a different dilutive effect for options and warrants; *[IAS 33.47]*
- to prior period diluted EPS as a result of a contingency period coming to an end without the conditions attaching to contingently issuable shares being met; *[IAS 33.52]* or
- to prior period diluted EPS for changes in the assumptions used in the calculations or for the conversion of potential ordinary shares into ordinary shares. *[IAS 33.65]*.

7.3 Disclosure

IAS 33 requires disclosure of the following:

(a) the amounts used as the numerators in calculating basic and diluted EPS, and a reconciliation of those amounts to profit or loss attributable to the parent entity for the period. The reconciliation should include the individual effect of each class of instruments that affects EPS;

(b) the weighted average number of ordinary shares used as the denominator in calculating basic and diluted earnings per share, and a reconciliation of these denominators to each other. The reconciliation should include the individual effect of each class of instruments that affects EPS;

(c) instruments (including contingently issuable shares) that could potentially dilute basic EPS in the future, but were not included in the calculation because they were antidilutive for the period(s) presented; and

(d) a description of ordinary share transactions or potential ordinary share transactions (other than those accounted for in EPS for the year – see 4.3 above – in which case that fact should be stated), that occur after the end of the reporting period and that would have changed significantly the number of ordinary shares or potential ordinary shares outstanding at the end of the period if those transactions had occurred before the end of the reporting period. *[IAS 33.70]*.

Examples of transactions in (d) include:

(a) an issue of shares for cash;

(b) an issue of shares when the proceeds are used to repay debt or preference shares outstanding at the end of the reporting period;

(c) the redemption of ordinary shares outstanding;

(d) the conversion or exercise of potential ordinary shares outstanding at the end of the reporting period into ordinary shares;

(e) an issue of options, warrants, or convertible instruments; and

(f) the achievement of conditions that would result in the issue of contingently issuable shares.

The standard observes that EPS amounts are not adjusted for such transactions occurring after the reporting period because such transactions do not affect the amount of capital used to produce profit or loss for the period. *[IAS 33.71]*. Changes in ordinary shares are discussed at 4 above.

The standard observes that financial instruments and other contracts generating potential ordinary shares may incorporate terms and conditions that affect the measurement of basic and diluted earnings per share. These terms and conditions may determine whether any potential ordinary shares are dilutive and, if so, the effect on the weighted average number of shares outstanding and any consequent adjustments to profit or loss attributable to ordinary equity holders. The disclosure of the terms and conditions of such financial instruments and other contracts is encouraged by IAS 33, if not otherwise required by IFRS 7 – *Financial Instruments: Disclosures* (discussed in Chapter 54). *[IAS 33.72]*.

8 APPENDIX

Reproduced below is the comprehensive worked example in IAS 33 of the computation and presentation of EPS. *[IAS 33.IE12]*. It illustrates four quarters and then the full year, but the principles and calculations would be the same whatever the length of the periods considered.

CALCULATION AND PRESENTATION OF BASIC AND DILUTED EARNINGS PER SHARE (COMPREHENSIVE EXAMPLE)

This example illustrates the quarterly and annual calculations of basic and diluted earnings per share in the year 20X1 for Company A, which has a complex capital structure. The control number is profit or loss from continuing operations attributable to the parent entity. Other facts assumed are as follows:

Average market price of ordinary shares: The average market prices of ordinary shares for the calendar year 20X1 were as follows:

First quarter	CU 49
Second quarter	CU 60
Third quarter	CU 67
Fourth quarter	CU 67

The average market price of ordinary shares from 1 July to 1 September 20X1 was CU 65.

Ordinary shares: The number of ordinary shares outstanding at the beginning of 20X1 was 5,000,000. On 1 March 20X1, 200,000 ordinary shares were issued for cash.

Convertible bonds: In the last quarter of 20X0, 5 per cent convertible bonds with a principal amount of CU 12,000,000 due in 20 years were sold for cash at CU 1,000 (par). Interest is payable twice a year, on 1 November and 1 May. Each CU 1,000 bond is convertible into 40 ordinary shares. No bonds were converted in 20X0. The entire issue was converted on 1 April 20X1 because the issue was called by Company A.

Convertible preference shares: In the second quarter of 20X0, 800,000 convertible preference shares were issued for assets in a purchase transaction. The quarterly dividend on each convertible preference share is CU 0.05, payable at the end of the quarter for shares outstanding at that date. Each share is convertible into one ordinary share. Holders of 600,000 convertible preference shares converted their preference shares into ordinary shares on 1 June 20X1.

Warrants: Warrants to buy 600,000 ordinary shares at CU 55 per share for a period of five years were issued on 1 January 20X1. All outstanding warrants were exercised on 1 September 20X1.

Options: Options to buy 1,500,000 ordinary shares at CU 75 per share for a period of 10 years were issued on 1 July 20X1. No options were exercised during 20X1 because the exercise price of the options exceeded the market price of the ordinary shares.

Tax rate: The tax rate was 40 per cent for 20X1.

20X1	*Profit (loss) from continuing operations attributable to the parent entity (a)*	*Profit (loss) attributable to the parent entity*	
	CU	*CU*	
First quarter	5,000,000	5,000,000	
Second quarter	6,500,000	6,500,000	
Third quarter	1,000,000	(1,000,000)	(b)
Fourth quarter	(700,000)	(700,000)	
Full year	11,800,000	9,800,000	

(a) This is the control number (before adjusting for preference dividends).

(b) Company A had a CU 2,000,000 loss (net of tax) from discontinued operations in the third quarter.

First Quarter 20X1

Basic EPS calculation	*CU*	
Profit from continuing operations attributable to the parent entity	5,000,000	
Less: preference shares dividends	(40,000)	(c)
Profit attributable to ordinary equity holders of the parent entity	4,960,000	

Dates	*Shares Outstanding*	*Fraction of period*	*Weighted-average shares*
1 January 28 February	5,000,000	2/3	3,333,333
Issue of ordinary shares on 1 March	200,000		
1 March 31 March	5,200,000	1/3	1,733,333
Weighted-average shares			5,066,666
Basic EPS			**CU 0.98**

(c) 800,000 shares × CU 0.05

Diluted EPS calculation			
Profit attributable to ordinary equity holders of the parent entity			CU 4,960,000
Plus: profit impact of assumed conversions			
Preference share dividends	CU 40,000	(d)	
Interest on 5% convertible bonds	CU 90,000	(e)	
Effect of assumed conversions			CU 130,000
Profit attributable to ordinary equity holders of the parent entity including assumed conversions			CU 5,090,000
Weighted-average shares			5,066,666
Plus: incremental shares from assumed conversions			
Warrants	0	(f)	
Convertible preference shares	800,000		
5% convertible bonds	480,000		
Dilutive potential ordinary shares			1,280,000
Adjusted weighted-average shares			6,346,666
Diluted EPS			**CU 0.80**

(d) 800,000 shares × CU 0.05

(e) (CU 12,000,000 × 5%) ÷ 4; less taxes at 40%

(f) The warrants were not assumed to be exercised because they were antidilutive in the period (CU 55 [exercise price] > CU 49 [average price]).

Second Quarter 20X1

Basic EPS calculation	*CU*	
Profit from continuing operations attributable to the parent entity	6,500,000	
Less: preference shares dividends	(10,000)	(g)
Profit attributable to ordinary equity holders of the parent entity	6,490,000	

Dates	*Shares outstanding*	*Fraction of period*	*Weighted-average shares*
1 April	5,200,000		
Conversion of 5% bonds on 1April	480,000		
1 April-31 May	5,680,000	2/3	3,786,666
Conversion of preference shares on 1June	600,000		
1 June-30 June	6,280,000	1/3	2,093,333
Weighted-average shares			5,880,000
Basic EPS			**CU 1.10**

(g) 200,000 shares × CU 0.05

Diluted EPS calculation			
Profit attributable to ordinary equity holders of the parent entity			CU 6,490,000
Plus: profit impact of assumed conversions			
Preference share dividends	CU 10,000	(h)	
Effect of assumed conversions			CU 10,000
Profit attributable to ordinary equity holders of the parent entity including assumed conversions			CU 6,500,000
Weighted-average shares			5,880,000
Plus: incremental shares from assumed conversions			
Warrants	50,000	(i)	
Convertible preference shares	600,000	(j)	
Dilutive potential ordinary shares			650,000
Adjusted weighted-average shares			6,530,000
Diluted EPS			**CU 1.00**

(h) 200,000 shares × CU 0.05

(i) CU 55 × 600,000 = CU 33,000,000; CU 33,000,000 ÷ CU 60 = 550,000;
600,000 – 550,000 = 50,000 shares *or*
[(CU 60 – CU 55) ÷ CU 60] × 600,000 shares = 50,000 shares

(j) (800,000 shares × 2/3) + (200,000 shares × 1/3)

Third Quarter 20X1

Basic EPS calculation	*CU*
Profit from continuing operations attributable to the parent entity	1,000,000
Less: preference shares dividends	(10,000)
Profit from continuing operations attributable to ordinary equity holders of the parent entity	990,000
Loss from discontinued operations attributable to the parent entity	(2,000,000)
Loss attributable to ordinary equity holders of the parent entity	(1,010,000)

Dates	*Shares outstanding*	*Fraction of period*	*Weighted-average shares*
1 July-31 August	6,280,000	2/3	4,186,666
Exercise of warrants on 1 September	600,000		
1 September-30 September	6,880,000	1/3	2,293,333
Weighted-average shares			6,480,000
Basic EPS			
Profit from continuing operations			**CU 0.15**
Loss from discontinued operations			**(CU 0.31)**
Loss			**(CU 0.16)**

Diluted EPS calculation			
Profit from continuing operations attributable to ordinary equity holders of the parent entity		CU 990,000	
Plus: profit impact of assumed conversions			
Preference shares dividends	CU 10,000		
Effect of assumed conversions		CU 10,000	
Profit from continuing operations attributable to ordinary equity holders of the parent entity including assumed conversions		CU 1,000,000	
Loss from discontinued operations attributable to the parent entity		(CU 2,000,000)	
Loss attributable to ordinary equity holders of the parent entity including assumed conversions		(CU 1,000,000)	
Weighted-average shares		6,480,000	
Plus: incremental shares from assumed conversions			
Warrants	61,538		(k)
Convertible preference shares	200,000		
Dilutive potential ordinary shares		261,538	
Adjusted weighted-average shares		6,741,538	
Diluted EPS			
Profit from continuing operations		**CU 0.15**	
Loss from discontinued operations		**(CU 0.30)**	
Loss		**(CU 0.15)**	

(k) [(CU 65 – CU 55) ÷ CU 65] × 600,000 = 92,308 shares; 92,308 × 2/3 = 61,538 shares

Note: The incremental shares from assumed conversions are included in calculating the diluted per-share amounts for the loss from discontinued operations and loss even though they are antidilutive. This is because the control number (profit from continuing operations attributable to ordinary equity holders of the parent entity, adjusted for preference dividends) was positive (i.e. profit, rather than loss).

Fourth Quarter 20X1

Basic and diluted EPS calculation	*CU*
Loss from continuing operations attributable to the parent entity	(700,000)
Add: preference shares dividends	(10,000)
Loss attributable to ordinary equity holders of the parent entity	(710,000)

Dates	*Shares outstanding*	*Fraction of period*	*Weighted-average shares*
1October-31 December	6,880,000	3/3	6,880,000
Weighted-average shares			6,880,000

Basic and diluted EPS	
Loss attributable to ordinary equity holders of the parent entity	**(CU 0.10)**

Note: The incremental shares from assumed conversions are not included in calculating the diluted per-share amounts because the control number (loss from continuing operations attributable to ordinary equity holders of the parent entity adjusted for preference dividends) was negative (i.e. a loss, rather than profit).

Full Year 20X1

Basic EPS calculation	*CU*
Profit from continuing operations attributable to the parent entity	11,800,000
Less: preference shares dividends	(70,000)
Profit from continuing operations attributable to ordinary equity holders of the parent entity	11,730,000
Loss from discontinued operations attributable to the parent entity	(2,000,000)
Profit attributable to ordinary equity holders of the parent entity	9,730,000

Dates	*Shares Outstanding*	*Fraction of period*	*Weighted-average shares*
1 January-28 February	5,000,000	2/12	833,333
Issue of ordinary shares on 1March	200,000		
1 March-31 March	5,200,000	1/12	433,333
Conversion of 5% bonds on 1April	480,000		
1 April-31 May	5,680,000	2/12	946,667
Conversion of preference shares on 1June	600,000		
1 June-31 August	6,280,000	3/12	1,570,000
Exercise of warrants on 1September	600,000		
1 September-31 December	6,880,000	4/12	2,293,333
Weighted-average shares			6,076,667

Basic EPS	
Profit from continuing operations	**CU 1.93**
Loss from discontinued operations	**(CU 0.33)**
Profit	**CU 1.60**

Diluted EPS calculation			
Profit from continuing operations attributable to ordinary equity holders of the parent entity			CU 11,730,000
Plus: profit impact of assumed conversions			
Preference share dividends	CU 70,000		
Interest on 5% convertible bonds	CU 90,000	(1)	
Effect of assumed conversions			CU 160,000
Profit from continuing operations attributable to ordinary equity holders of the parent entity including assumed conversions			CU 11,890,000
Loss from discontinued operations attributable to the parent entity			(CU 2,000,000)
Profit attributable to ordinary equity holders of the parent entity including assumed conversions			CU 9,890,000

Weighted-average shares			6,076,667
Plus: incremental shares from assumed conversions			
Warrants	14,880	(m)	
Convertible preference shares	450,000	(n)	
5% convertible bonds	120,000	(o)	
Dilutive potential ordinary shares			584,880

Diluted EPS			
Profit from continuing operations			**CU 1.78**
Loss from discontinued operations			**(CU 0.30)**
Profit			**CU 1.48**

(l) (CU 12,000,000 × 5%) ÷ 4; less taxes at 40%

(m) [(CU 57.125† – CU 55) ÷ CU 57.125] × 600,000 = 22,320 shares; 22,320 × 8/12 = 14,880 shares
†The average market price from 1 January 20X1 to 1 September 20X1

(n) (800,000 shares × 5/12) + (200,000 shares × 7/12)

(o) 480,000 shares × 3/12

The following illustrates how Company A might present its earnings per share data in its statement of comprehensive income. Note that the amounts per share for the loss from discontinued operations are not required to be presented on the face of the statement of comprehensive income.

	For the year ended 20X1 CU
Earnings per ordinary share	
Profit from continuing operations	1.93
Loss from discontinued operations	(0.33)
Profit	1.60
Diluted earnings per ordinary share	
Profit from continuing operations	1.78
Loss from discontinued operations	(0.30)
Profit	1.48

The following table includes the quarterly and annual earnings per share data for Company A. The purpose of this table is to illustrate that the sum of the four quarters' earnings per share data will not necessarily equal the annual earnings per share data. The Standard does not require disclosure of this information.

	First quarter CU	*Second quarter CU*	*Third quarter CU*	*Fourth quarter CU*	*Full year CU*
Basic EPS					
Profit (loss) from continuing operations	0.98	1.10	0.15	(0.10)	1.93
Loss from discontinued operations	–	–	(0.31)	–	(0.33)
Profit (loss)	0.98	1.10	(0.16)	(0.10)	1.60
Diluted EPS					
Profit (loss) from continuing operations	0.80	1.00	0.15	(0.10)	1.78
Loss from discontinued operations	–	–	(0.30)	–	(0.30)
Profit (loss)	0.80	1.00	(0.15)	(0.10)	1.48

This example does not illustrate the classification of the components of convertible financial instruments as liabilities and equity or the classification of related interest and dividends as expenses and equity as required by IAS 32.

Chapter 38 Events after the reporting period

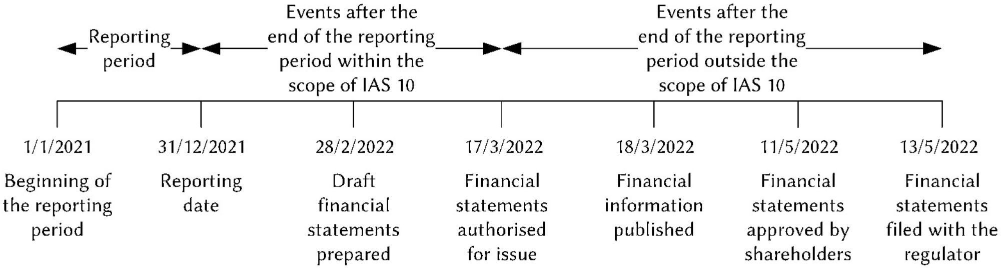
1 INTRODUCTION

IAS 10 – *Events after the Reporting Period* – deals with accounting for, and disclosure of: 'those events, favourable and unfavourable, that occur between the end of the reporting period and the date when the financial statements are authorised for issue'. *[IAS 10.2, 3].* This definition, therefore, includes all events occurring between those dates – irrespective of whether they relate to conditions that existed at the end of the reporting period. The principal issue is determining which events after the reporting period are required to be reflected in the financial statements as adjustments, which are material enough to require additional disclosure, and which require neither adjustment nor disclosure.

The following timeline illustrates events after the end of the reporting period that are within the scope of IAS 10 for an entity with a 31 December year-end:



Reporting period
Events after the end of the reporting period within the scope of IAS 10
Events after the end of the reporting period outside the scope of IAS 10
1/1/2021
Beginning of the reporting period
31/12/2021
Reporting date
28/2/2022
Draft financial statements prepared
17/3/2022
Financial statements authorised for issue
18/3/2022
Financial information published
11/5/2022
Financial statements approved by shareholders
13/5/2022
Financial statements filed with the regulator

The financial statements of an entity present, among other things, its financial position at the end of the reporting period. Therefore, it is appropriate to adjust the financial statements for all events that offer greater clarity concerning the conditions that existed at the end of the reporting period, that occur prior to the date the financial statements are authorised for issue. The standard requires entities to adjust the amounts recognised in the financial statements for 'adjusting events' that provide evidence of conditions that existed at the end of the reporting period. *[IAS 10.3(a), 8].* An entity does not recognise in the financial statements those events that relate to conditions that arose after the reporting period ('non-adjusting events'). However, if non-adjusting events are material (that is, non-disclosure of the event could reasonably be expected to influence decisions that the primary users of general purpose financial statements make on the basis of those financial statements), the standard requires certain disclosures about them. *[IAS 10.3(b), 10, 21]*.

One exception to the general rule of the standard for non-adjusting events is when the going concern basis becomes inappropriate. This is treated as an adjusting event. *[IAS 10.1, 14]*.

The requirements of IAS 10 and some practical issues resulting from these requirements are dealt with, respectively, at 2 and 3 below.

2 REQUIREMENTS OF IAS 10

2.1 Objective, scope and definitions

The objective of IAS 10 is to prescribe:

- when an entity should adjust its financial statements for events after the reporting period; and
- the disclosures that an entity should give about the date when the financial statements were authorised for issue and about events after the reporting period. *[IAS 10.1]*.

The standard does not permit an entity to prepare its financial statements on a going concern basis if events after the reporting period indicate that the going concern assumption is not appropriate. *[IAS 10.1]*. This requirement is discussed further at 2.2.2 below. The going concern basis is discussed in Chapter 3 at 4.1.2.

IAS 10 defines events after the reporting period as 'those events, favourable and unfavourable, that occur between the end of the reporting period and the date when the financial statements are authorised for issue'. *[IAS 10.3]*. This definition therefore includes events that provide additional evidence about conditions that existed at the end of the reporting period, as well as those that do not. The former are adjusting events, the latter are non-adjusting events. *[IAS 10.3]*. Adjusting and non-adjusting events are discussed further at 2.1.2 and 2.1.3 below, respectively.

2.1.1 Date when financial statements are authorised for issue

Given the definition above, the meaning of 'the date when the financial statements are authorised for issue' is clearly important. The standard observes that the process for authorising financial statements for issue varies depending upon the management structure, statutory requirements and procedures followed in preparing and finalising the financial statements. *[IAS 10.4]*.

The standard identifies two particular instances of the different meaning of 'authorised for issue' as follows:

(a) an entity may be required to submit its financial statements to its shareholders for approval after the financial statements have been issued. In such cases, the financial statements are authorised for issue on the date of issue, not the date when shareholders approve them; *[IAS 10.5]* and

(b) the management of an entity may be required to issue its financial statements to a supervisory board (made up solely of non-executives) for approval. Such financial statements are authorised for issue when management authorises them for issue to the supervisory board. *[IAS 10.6]*.

These two meanings are illustrated by the following two examples, which are based on the illustrative examples contained in IAS 10. *[IAS 10.5-6]*.

Example 38.1: Financial statements required to be approved by shareholders

The management of an entity completes draft financial statements for the year to 31 December 2021 on 28 February 2022. On 17 March 2022, the board of directors reviews the financial statements and authorises them for issue. The entity announces its profit and certain other financial information on 18 March 2022. The financial statements are made available to shareholders and others on 1 April 2022. The shareholders approve the financial statements at their annual meeting on 11 May 20221 and the approved financial statements are then filed with a regulatory body on 13 May 2022.

The financial statements are authorised for issue on 17 March 2022 (date of board authorisation for issue).

Example 38.2: Financial statements required to be approved by supervisory board

On 17 March 2022, the management of an entity authorises for issue to its supervisory board financial statements for the year ended 31 December 2021. The supervisory board consists solely of non-executives and may include representatives of employees and other outside interests. The supervisory board approves the financial statements on 25 March 2022. The financial statements are made available to shareholders and others on 1 April 2022. The shareholders approve the financial statements at their annual meeting on 11 May 2022 and the financial statements are filed with a regulatory body on 13 May 2022.

The financial statements are authorised for issue on 17 March 2022 (date of management authorisation for issue to the supervisory board).

An uncommon, but possible, situation that may occur is that the financial statements are changed after they are authorised for issue to the supervisory board. The following example illustrates such a situation.

Example 38.3: Financial statements required to be approved by supervisory board – changes are made by supervisory board

Same facts as in Example 38.2 above, except that the supervisory board reviews the financial statements on 25 March 2022 and proposes changes to certain note disclosures. The management of the entity incorporates the suggested changes and re-authorises those financial statements for issue to the supervisory board on 27 March 2022. The supervisory board then approves the financial statements on 30 March 2022.

The financial statements are authorised for issue on 27 March 2022 (date of management re-authorisation for issue to the supervisory board).

As governance structures vary by jurisdiction, entities may be allowed to organise their procedures differently and adjust the financial reporting process accordingly.

An example of a company which is required to submit its financial statements to its shareholders for approval is LafargeHolcim Ltd, as illustrated in the following extract:

Extract 38.1: LafargeHolcim Ltd (2019)

Notes to the consolidated financial statements [extract]

22. Authorization of the financial statements for issuance

The consolidated financial statements were authorized for issuance by the Board of Directors of LafargeHolcim Ltd on 26 February 2020 and are subject to shareholder approval at the Annual General Meeting of shareholders scheduled for 12 May 2020.

As discussed above, an entity may be required to issue its financial statements to a supervisory board (made up solely of non-executives) for approval. For such instances, the phrase 'made up solely of non-executives' is not defined by the standard, although it contemplates that a supervisory board may include representatives of employees and other outside interests. However, it seems to draw a distinction between those responsible for the executive management of an entity (and the preparation of its financial statements) and those in a position of high-level oversight (including reviewing and approving the financial statements). This situation seems to describe the typical two-tier board system seen in some jurisdictions. An example of a company with this structure is Bayer AG, as illustrated in the following extract.

Extract 38.2: Bayer Aktiengesellschaft (2019)

Combined Management Report [extract]

4. **Corporate Governance Report** [extract]

4.1 **Declaration by Corporate Management Pursuant to Sections 289f and 315d of the German Commercial Code** [extract]

Supervisory Board [extract]

Composition and objectives (diversity concept and expertise profile) [extract]

Under the German Codetermination Act, half of the Supervisory Board's 20 members are elected by the stockholders, and half by the company's employees.

[...]

Procedure and committees

The role of the Supervisory Board is to oversee and advise the Board of Management. The Supervisory Board is directly involved in decisions on matters of fundamental importance to the company, regularly conferring with the Board of Management on the company's strategic alignment and the implementation status of the business strategy. The Report of the Supervisory Board in this Annual Report provides details about the work of the Supervisory Board and its committees. In 2019, the Supervisory Board established a special committee to address the glyphosate litigations.

[...]

Report of the Supervisory Board [extract]

Financial statements and audits [extract]

We have approved the financial statements of Bayer AG and the consolidated financial statements of the Bayer Group prepared by the Board of Management. The financial statements of Bayer AG are thus confirmed.

2.1.1.A Impact of preliminary reporting

The example below illustrates when the entity releases preliminary information, but not complete financial statements, before the date of the authorisation for issue.

Example 38.4: Release of financial information before date of authorisation for issue

The management of an entity completes the primary financial statements for the year to 31 December 2021 on 21 January 2022, but has not yet completed the explanatory notes. On 26 January 2022, the board of directors (which includes management and non-executives) reviews the primary financial statements and authorises them for public media release. The entity announces its profit and certain other financial information on 28 January 2022. On 11 February 2022, management issues the financial statements (with full explanatory notes) to the board of directors, which approves the financial statements for filing on 18 February 2022. The entity files the financial statements with a regulatory body on 21 February 2022.

The financial statements are authorised for issue on 18 February 2022 (date the board of directors, approves the financial statements for filing).

Example 38.4 illustrates that events after the reporting period include all events up to the date when the financial statements are authorised for issue, even if those events occur after the public announcement of profit or of other selected financial information. *[IAS 10.7]*. Accordingly, the information in the financial statements might differ from the equivalent information in a preliminary announcement.

2.1.1.B Re-issuing (dual dating) financial statements

IFRSs do not address whether and how an entity may amend its financial statements after they have been authorised for issue. Generally, such matters are dealt with in local laws or regulations.

If an entity re-issues financial statements (whether to correct an error or to include events that occurred after the financial statements were originally authorised for issue), there is a new date of authorisation for issue. The financial statements should then appropriately reflect all adjusting events, by updating the amounts recognised in the financial statements, and non-adjusting events, through additional disclosure, up to the new date of authorisation for issue.

However, in certain circumstances, the re-issuing of previously issued financial statements is required by local regulators particularly for inclusion in public offering and similar documents. Consequently, in November 2012, the Interpretations Committee was asked to clarify the accounting implications of applying IAS 10 when previously issued financial statements are re-issued in connection with an offering document.[1]

In May 2013, the Interpretations Committee responded that:

- the scope of IAS 10 is the accounting for, and disclosure of, events after the reporting period and that the objective of this Standard is to prescribe:
  - (a) when an entity should adjust its financial statements for events after the reporting period; and
  - (b) the disclosures that an entity should give about the date when the financial statements were authorised for issue and about events after the reporting period;
- financial statements prepared in accordance with IAS 10 should reflect all adjusting and non-adjusting events up to the date that the financial statements were authorised for issue; and
- IAS 10 does not address the presentation of re-issued financial statements in an offering document when the originally issued financial statements have not been withdrawn, but the re-issued financial statements are provided either as supplementary information or a re-presentation of the original financial statements in an offering document in accordance with regulatory requirements.

The Interpretations Committee decided not to add this issue to its agenda on the basis of the above and because the issue arises in multiple jurisdictions, each with particular securities laws and regulations which may dictate the form for re-presentations of financial statements.[2]

Accordingly, depending on the particular regulatory requirements in a given jurisdiction, there may be variations in how re-issued financial statements are presented.

2.1.2 *Adjusting events*

Adjusting events are 'those that provide evidence of conditions that existed at the end of the reporting period.' *[IAS 10.3(a)]*.

Examples of adjusting events are as follows:

(a) the settlement after the reporting period of a court case that confirms that the entity had a present obligation at the end of the reporting period. In this situation, an entity adjusts any previously recognised provision related to this court case in accordance with IAS 37 – *Provisions, Contingent Liabilities and Contingent Assets* – or recognises a new provision. Mere disclosure of a contingent liability is not sufficient because the settlement provides additional evidence of conditions that existed at the end of the reporting period that would give rise to a provision in accordance with IAS 37 (see Chapter 26 at 3.1.1 and 3.2.1);

(b) the receipt of information after the reporting period indicating that an asset was impaired at the end of the reporting period, or that the amount of a previously recognised impairment loss for that asset needs to be adjusted. For example:

   (i) the bankruptcy of a customer that occurs after the reporting period usually confirms that the customer was credit-impaired at the end of the reporting period (this is discussed further at 3.3 below); and

   (ii) the sale of inventories after the reporting period may give evidence about their net realisable value at the end of the reporting period;

(c) the determination after the reporting period of the cost of assets purchased, or the proceeds from assets sold, before the end of the reporting period;

(d) the determination after the reporting period of the amount of profit-sharing or bonus payments, if the entity had a present legal or constructive obligation at the end of the reporting period to make such payments as a result of events before that date (see Chapter 35 at 12.3); and

(e) the discovery of fraud or errors that show that the financial statements are incorrect (see 3.5 below). *[IAS 10.9]*.

In addition, IFRIC 23 – *Uncertainty over Income Tax Treatments* – requires entities to apply IAS 10 to determine whether changes in facts and circumstances or new information after the reporting period gives rise to an adjusting or non-adjusting event for reassessing a judgement or estimate of an uncertain tax position. *[IFRIC 23.14]*. An event would be considered adjusting if the change in facts and circumstances or new information after the reporting period provided evidence of conditions that existed at the end of the reporting period (see 3.6 below).

IAS 33 – *Earnings per Share* – is another standard that requires an adjustment for certain transactions after the reporting period. IAS 33 requires an adjustment to earnings per share for certain share transactions after the reporting period (such as bonus issues, share splits or reverse share splits (share consolidations) as discussed in

Chapter 37 at 4.3 and 4.5) even though the transactions themselves are non-adjusting events (see 2.1.3 below). *[IAS 10.22(f)]*.

2.1.3 Non-adjusting events

The standard states that non-adjusting events are 'those that are indicative of conditions that arose after the reporting period'. *[IAS 10.3(b)]*.

Examples of non-adjusting events after the reporting period are as follows:

(a) a major business combination (IFRS 3 – *Business Combinations* – requires specific disclosures in such cases, see Chapter 9 at 16.1.2) or disposing of a major subsidiary;

(b) announcing a plan to discontinue an operation;

(c) major purchases of assets, classification of assets as held for sale in accordance with IFRS 5 – *Non-current Assets Held for Sale and Discontinued Operations*, other disposals of assets, or expropriation of major assets by government (see Chapter 4 at 5.1 for certain disclosures that are required to be made);

(d) the destruction of a major production plant by a fire;

(e) announcing, or commencing the implementation of, a major restructuring (discussed in Chapter 26 at 6.1.2);

(f) major ordinary share transactions and potential ordinary share transactions (although as noted at 2.1.2 above, some transactions in ordinary shares are adjusting events for the purposes of computing earnings per share);

(g) abnormally large changes in asset prices or foreign exchange rates;[3]

(h) changes in tax rates or the enactment or announcement of tax laws that significantly affect current and deferred tax assets and liabilities (discussed in Chapter 33 at 5.1.3 and 8.1.2);

(i) entry into significant commitments or contingent liabilities, for example, by issuing significant guarantees;

(j) start of major litigation arising solely out of events that occurred after the reporting period;

(k) a decline in fair value of investments;

(l) a declaration of dividends to holders of equity instruments (as defined in IAS 32 – *Financial Instruments: Presentation* – discussed in Chapter 47 at 8);

(m) a subsequent rectification of a breach in a long debt term covenant; and

(n) a contingent asset becoming virtually certain after the end of the reporting period (discussed in Chapter 26 at 3.2.2). *[IAS 10.11, 12, 22, IAS 1.76, IAS 37.35]*.

The reference in (a) and (c) above to asset disposals as examples of non-adjusting events is not quite the whole story as these may indicate an impairment of assets, which may be an adjusting event. In addition, (b) and (e) above regarding announcements of plans to discontinue an operation or to restructure a business, respectively, may also lead to an impairment charge (see Chapter 20 at 5.1).

IFRS 5 makes it clear that the held for sale criteria must be met at the reporting date for a non-current asset (or disposal group) to be classified as held for sale in those financial statements. However, if those criteria are met after the reporting date but before the authorisation of the financial statements for issue, IFRS 5 requires certain additional disclosures (see Chapter 4 at 2.1.2 and 5.1). *[IFRS 5.12]*.

Information provided under (i) above, will be in addition to the disclosure of commitments that exist at the reporting date which other standards require. For example, IAS 16 – *Property, Plant and Equipment* – and IAS 38 – *Intangible Assets* – require commitments for the acquisition of property, plant and equipment and intangible assets to be disclosed (see Chapter 18 at 8.1 and Chapter 17 at 10.1). *[IAS 16.74(c), IAS 38.122(e)]*. IFRS 16 – *Leases* – requires a lessee to disclose the amount of its lease commitments for short-term leases if the portfolio of short-term leases to which it is committed at the end of the reporting period is dissimilar to the portfolio of short-term leases for which current period short-term lease expense disclosure was provided (see Chapter 23 at 5.8.2). *[IFRS 16.55]*.

For declines in fair value of investments, as in (k) above, the standard notes that the decline in fair value does not normally relate to the condition of the investments at the end of the reporting period, but reflects circumstances that arose subsequently. Therefore, in those circumstances the amounts recognised in financial statements for the investments are not adjusted. Similarly, the standard states that an entity does not update the amounts disclosed for the investments as at the end of the reporting period, although it may need to give additional disclosure, if material, as discussed at 2.3 below. *[IAS 10.11]*.

However, the assertion that a decline in fair value of investments does not normally relate to conditions at the end of the reporting period is similar wording to that used for bankruptcy and the sale of inventories (see 2.1.2(b) above). Therefore, it requires an assessment of the circumstances in order to determine which conditions actually existed at the end of the reporting period – although this can be difficult in practice, particularly when fraud is involved (see 3.5 below).

In addition to the examples of non-adjusting events the standard provides, IFRIC 23 requires entities to apply IAS 10 to determine whether changes in facts and circumstances or new information after the reporting period gives rise to an adjusting or non-adjusting event when reassessing a judgement or estimate of an uncertain tax position. *[IFRIC 23.14]*. An event would only be considered non-adjusting if the change in facts and circumstances or new information after the reporting period was indicative of conditions that arose after the reporting period (see 3.6 below).

The subsequent rectification of a breach in a long debt term covenant is not an adjusting event and therefore does not change the classification of the liability in the statement of financial position from current to non-current (see 2.3.2 below). *[IAS 1.76]*.

Another example of a non-adjusting event not mentioned by IAS 10 is where a contingent asset becomes virtually certain after the end of the reporting period. If the inflow of economic benefits from a contingent asset has become virtually certain, IAS 37 indicates that the asset and the related income should be recognised in the period in which the change occurs. The requirement to recognise the effect of changing circumstances in the period in which the change occurs extends to the analysis of information available after the end of the reporting period but before the date when the financial statements are authorised for issue. In contrast to contingent liabilities, no adjustment should be made to reflect the subsequent settlement of a legal claim in favour of the entity since the period in which the change occurs is after the end of the reporting period. An asset could only be recognised if, at the end of the reporting period, the entity could show that it was virtually certain that its claim would succeed (see Chapter 26 at 3.2.2). *[IAS 37.35]*.

2.1.3.A Dividend declaration

In respect of dividend declarations, as in (l) at 2.1.3 above, dividends are only recognised as a liability if declared on or by the end of the reporting period. If an entity declares dividends to holders of equity instruments (as defined in IAS 32) after the reporting period, the entity shall not recognise those dividends as a liability at the end of the reporting period. *[IAS 10.13]*. While an entity may have a past practice of paying dividends, such dividends are not declared and, therefore, not recognised as an obligation. *[IAS 10.BC4]*.

As a consequential amendment to IAS 10, the definition of 'declared' in this context was moved to IFRIC 17 – *Distributions of Non-cash Assets to Owners*. IFRIC 17 did not change the principle regarding the appropriate timing for the recognition of dividends payable. *[IFRIC 17.BC18-20]*. It states that an entity recognises a liability to pay a dividend when the dividend is appropriately authorised and is no longer at the discretion of the entity, which is the date:

- when declaration of the dividend, e.g. by management or the board of directors, is approved by the relevant authority, e.g. the shareholders, if the jurisdiction requires such approval; or
- when the dividend is declared, e.g. by management or the board of directors, if the jurisdiction does not require further approval. *[IFRIC 17.10]*.

In many jurisdictions, the directors may keep discretion to cancel an interim dividend until such time as it is paid. In this case, the interim dividend is not declared (within the meaning described above), and is, therefore, not recognised until paid. Final dividends proposed by directors, in many jurisdictions, are only binding when approved by shareholders in general meeting or by the members passing a written resolution. Therefore, such a final dividend is only recognised as a liability when declared, i.e. approved by the shareholders at the annual general meeting or through the passing of a resolution by the members of an entity.

IAS 10 contains a reminder that an entity discloses dividends, both proposed and declared after the reporting period but before the financial statements are authorised for issue, in the notes to the financial statements in accordance with IAS 1 – *Presentation of Financial Statements* (see Chapter 3 at 5.5). *[IAS 1.137, IAS 10.13]*.

Similar issues arise regarding the declaration of dividends by subsidiaries, associates and other equity investments. Although IAS 10 does not specifically address such items, IFRS 9 – *Financial Instruments* – requires a shareholder to recognise dividends when the shareholder's right to receive payment is established, it is probable that the economic benefits associated with the dividend will flow to the shareholder and the dividend can be measured reliably (see Chapter 50 at 2.5). *[IFRS 9.5.7.1A]*.

Similarly, IAS 27 – *Separate Financial Statements* – also contains this general principle in recognising in an entity's separate financial statements those dividends received from subsidiaries, joint ventures or associates when its right to receive the dividend is established (see Chapter 8 at 2.4.1). *[IAS 27.12]*. Accordingly, a shareholder does not recognise such dividend income until the period in which the dividend is declared.

2.2 The treatment of adjusting events

2.2.1 Events requiring adjustment to the amounts recognised, or disclosures, in the financial statements

IAS 10 requires that the amounts recognised in the financial statements be adjusted to take account of an adjusting event. *[IAS 10.8]*.

The standard also notes that an entity may receive information after the reporting period about conditions existing at the end of the reporting period relating to disclosures made in the financial statements but not affecting the amounts recognised in them. *[IAS 10.20]*. In such cases, the standard requires the entity to update the disclosures that relate to those conditions for the new information. *[IAS 10.19]*.

For example, evidence may become available after the reporting period about a contingent liability that existed at the end of the reporting period. In addition to considering whether to recognise or change a provision under IAS 37, IAS 10 requires an entity to update its disclosures about the contingent liability for that evidence. *[IAS 10.20]*.

2.2.2 Events indicating that the going concern basis is not appropriate

If management determines after the reporting period (but before the financial statements are authorised for issue) either that it intends to liquidate the entity or to cease trading, or that it has no realistic alternative but to do so, the financial statements should not be prepared on the going concern basis. *[IAS 10.14]*.

Deterioration in operating results and financial position after the reporting period may indicate a need to consider whether the going concern assumption is still appropriate. If the going concern assumption is no longer appropriate, the standard states that the effect is so pervasive that it results in a fundamental change in the basis of accounting, rather than an adjustment to the amounts recognised within the original basis of accounting. *[IAS 10.15]*. As discussed in Chapter 3 at 4.1.2, IFRS contains no guidance on this 'fundamental change in the basis of accounting'. Accordingly, entities will need to consider carefully their individual circumstances to arrive at an appropriate basis.

The standard also contains a reminder of the specific disclosure requirements under IAS 1:

(a) when the financial statements are not prepared on a going concern basis, that fact should be disclosed, together with the basis on which the financial statements have been prepared and the reason why the entity is not regarded as a going concern; or

(b) when management is aware of material uncertainties related to events or conditions that may cast significant doubt upon the entity's ability to continue as a going concern, disclosure of those uncertainties should be made. *[IAS 10.16(a), 16(b), IAS 1.25]*.

While IFRSs are generally written from the perspective that an entity is a going concern, they are also applicable when another basis of accounting is used to prepare financial statements. Various IFRSs acknowledge that financial statements may be prepared on either a going concern basis or an alternative basis of accounting. *[IAS 1.25, IAS 10.14, CF 3.9]*. Such IFRSs do not specifically exclude the application of IFRS when an alternative basis of accounting is used. As a result, financial statements prepared on a 'non-going concern' basis of accounting may be described as complying with IFRS as long as that other basis of preparation is sufficiently described in accordance with paragraph 25 of IAS 1. This is further discussed in Chapter 3 at 4.1.2.

Regarding the requirement in (b) above, the events or conditions requiring disclosure may arise after the reporting period. *[IAS 10.16(b)]*.

2.3 The treatment of non-adjusting events

IAS 10 prohibits the adjustment of amounts recognised in financial statements to reflect non-adjusting events. *[IAS 10.10]*. It indicates that if non-adjusting events are material, non-disclosure could reasonably be expected to influence decisions that the primary users of general purpose financial statements make on the basis of those financial statements. Accordingly, an entity should disclose the following for each material category of non-adjusting event:

(a) the nature of the event; and

(b) an estimate of its financial effect, or a statement that such an estimate cannot be made. *[IAS 10.21]*.

To illustrate how these requirements have been applied in practice, two examples of disclosure for certain types of non-adjusting events are given below.

Possibly the non-adjusting events that appear most regularly in financial statements are the acquisition/disposal of a non-current asset, such as an investment in a subsidiary or a business, subsequent to the end of the reporting period.

Extract 38.3 contains an example of the disclosures required for 2.1.3(a) above related to a business combination:

Extract 38.3: Cranswick plc (2016)

Notes to the accounts [extract]

30. Events after the balance sheet date

On 8 April 2016, the Group acquired 100 per cent of the issued share capital of CCL Holdings Limited and its wholly owned subsidiary Crown Chicken Limited ('Crown') for net cash consideration of £39.3 million. The principal activities of Crown Chicken Limited are the breeding, rearing and processing of fresh chicken, as well as the milling of grain for the production of animal feed. The acquisition provides the Group with a fully integrated supply chain for its growing poultry business.

Fair values of the net assets at the date of acquisition were as follows:

	Provisional fair value £'000
Net assets acquired:	
Property, plant and equipment	17,501
Biological assets	4,805
Inventories	1,865
Trade and other receivables	9,845
Bank and cash balances	3,946
Trade and other payables	(7,900)
Corporation tax liability	(541)
Deferred tax liability	(1,815)
Finance lease obligations	(370)
	27,336
Goodwill arising on acquisition	15,878
Total consideration	43,214
Satisfied by:	
Cash	43,214
Net cash outflow arising on acquisition:	
Cash consideration paid	43,214
Cash and cash equivalents acquired	(3,946)
	39,268

The fair values on acquisition are provisional due to the timing of the transaction and will be finalised within twelve months of the acquisition date.

Included in the £15,878,000 of goodwill recognised above, are certain intangible assets that cannot be individually separated from the acquiree and reliably measured due to their nature. These items include the expected value of synergies and an assembled workforce and the strategic benefits of vertical integration including security of supply.

Transaction costs in relation to the acquisition are expected to total £0.4 million, expensed within administrative expenses.

All of the trade receivables acquired are expected to be collected in full.

Extract 38.4 contains an example of the disclosure of major ordinary share transactions after the reporting period as described at 2.1.3(f) above:

> *Extract 38.4: PGS ASA (2019)*
>
> **Notes** [extract]
>
> 31. **SUBSEQUENT EVENTS** [extract]
>
> On February 13, 2020, an extraordinary general meeting of PGS ASA approved to increase the share capital in the Company by issuing new shares following a private placement of equity.

It is important to note that the list of examples of non-adjusting events in IAS 10, and summarised at 2.1.3 above, is not an exhaustive one; IAS 10 requires disclosure of any material non-adjusting event.

2.3.1 Declaration to distribute non-cash assets to owners

When an entity declares a dividend to distribute a *non-cash asset* to owners after the end of a reporting period but before the financial statements are authorised for issue, IFRIC 17 requires an entity to disclose: *[IFRIC 17.17]*

(a) the nature of the asset to be distributed;

(b) the carrying amount of the asset to be distributed as of the end of the reporting period; and

(c) the fair value of the asset to be distributed as of the end of the reporting period, if it is different from its carrying amount, and the following information about the method(s) used to measure that fair value:

  (i) the level of the fair value hierarchy within which the fair value measurement is categorised (Level 1, 2 or 3); *[IFRS 13.93(b)]*

  (ii) for fair value measurement categorised within Level 2 and Level 3 of the fair value hierarchy, a description of the valuation technique(s) and the inputs used in the fair value measurement. If there has been a change in valuation technique (e.g. changing from a market approach to an income approach or the use of an additional valuation technique), the entity should disclose that change and the reason(s) for making it. For fair value measurement categorised within Level 3 of the fair value hierarchy, quantitative information about the significant unobservable inputs used in the fair value measurement should be provided. An entity is not required to create quantitative information to comply with this disclosure requirement if quantitative unobservable inputs are not developed by the entity when measuring fair value (e.g. when an entity uses prices from prior transactions or third-party pricing information without adjustment). However, when providing this disclosure the quantitative unobservable inputs that are significant to the fair value measurement and are reasonably available to the entity should not be ignored; *[IFRS 13.93(d)]*

  (iii) for fair value measurement categorised within Level 3 of the fair value hierarchy, a description of the valuation processes used by the entity (including, for example, how an entity decides its valuation policies and procedures and analyses changes in fair value measurements from period to period); *[IFRS 13.93(g)]* and

(iv) if the highest and best use of the non-financial asset differs from its current use, an entity should disclose that fact and why the non-financial asset is being used in a manner that differs from its highest and best use. *[IFRS 13.93(i)]*.

In the case of (c) above, any quantitative disclosures are required to be presented in a tabular format, unless another format is more appropriate. *[IFRS 13.99]*. Fair value measurement is further discussed in Chapter 14.

2.3.2 Breach of a long-term loan covenant and its subsequent rectification

When an entity breaches a provision[4] of a long-term loan arrangement on or before the end of the reporting period with the effect that the liability becomes payable on demand, it classifies the liability as current in its statement of financial position (see Chapter 3 at 3.1.4.A and 3.1.4.B). *[IAS 1.74]*. This may also give rise to going concern uncertainties (see 2.2.2 above).

It is not uncommon that such covenant breaches are subsequently rectified; however, a subsequent rectification is not an adjusting event and therefore does not change the classification of the liability in the statement of financial position from current to non-current.

IAS 1 requires disclosure of the following[5] remedial arrangements if such events occur between the end of the reporting period and the date the financial statements are authorised for issue:

- refinancing on a long-term basis;
- rectification of a breach of a long-term loan arrangement; and
- the granting by the lender of a period of grace to rectify a breach of a long-term loan arrangement ending at least twelve months after the reporting period (see Chapter 3 at 5.5). *[IAS 1.76]*.

2.4 Other disclosure requirements

The disclosures required in respect of non-adjusting events are discussed at 2.3 above. As IAS 10 only requires consideration to be given to events that occur up to the date when the financial statements are authorised for issue, it is important for users to know that date, since the financial statements do not reflect events after that date. *[IAS 10.18]*. Accordingly, IAS 10 requires disclosure of the date the financial statements were authorised for issue. Furthermore, it requires: disclosure of who authorised the financial statements for issue and, if the owners of the entity or others have the power to amend them after issue, disclosure of that fact. *[IAS 10.17]*. In practice, this information can be presented in a number of ways:

(a) on the face of a primary statement (for example, entities that are required to have the statement of financial position signed could include the information at that point);

(b) in the note dealing with other IAS 10 disclosures or another note (such as the summary of significant accounting policies); or

(c) in a separate statement such as a statement of directors' responsibilities for the financial statements (that is, outside of the financial statements as permitted in certain jurisdictions).

Strictly speaking, this information is required to be presented within the financial statements. So, if (c) above were chosen, either the whole report would need to be part of the financial statements or the information could be incorporated into them by way of a cross-reference.

In addition to the IAS 10 disclosure requirements, other standards may require disclosures to be provided about future events, for example, IAS 8 – *Accounting Policies, Changes in Accounting Estimates and Errors* – requires disclosure of the expected impact of new standards that are issued but are not yet effective at the reporting date (see Chapter 3 at 5.1.2.C). *[IAS 8.30]*.

3 PRACTICAL ISSUES

The standard alludes to practical issues such as those discussed below. It states that a decline in fair value of investments after the reporting period does not normally relate to conditions at the end of the reporting period and therefore would be a non-adjusting event (see 2.1.3 above). At the same time, the standard asserts that the bankruptcy of a customer that occurs after the reporting period would usually be an adjusting event (see 2.1.2 above). Judgement of the facts and circumstances is required to determine whether an event that occurs after the reporting period provides evidence about a condition that existed at the end of the reporting period, or whether the condition arose subsequent to the reporting period.

3.1 Valuation of inventory

The sale of inventories after the reporting period is normally a good indicator of their net realisable value (NRV) at that date. IAS 10 states that such sales 'may give evidence about their net realisable value at the end of the reporting period'. *[IAS 10.9(b)(ii)]*. However, in some cases, NRV decreases because of conditions that did not exist at the end of the reporting period.

Therefore, the problem is determining why NRV decreased. Did it decrease because of circumstances that existed at the end of the reporting period, which subsequently became known, or did it decrease because of circumstances that arose subsequently? A decrease in price is merely a response to changing conditions so it is important to assess the reasons for, and timing of, these changes.

Some examples of changing conditions are as follows:

(a) Price reductions caused by a sudden increase in cheap imports

Whilst it is arguable that the 'dumping' of cheap imports after the reporting period is a condition that arises subsequent to that date, it is more likely that this is a reaction to a condition that already existed such as overproduction in other parts of the world. Thus, it might be more appropriate in such a situation to adjust the value of inventories based on its subsequent NRV.

(b) Price reductions caused by increased competition

The reasons for price reductions and increased competition do not generally arise overnight but normally occur over a period. For example, a competitor may have built up a competitive advantage by investing in machinery that is more efficient. In these circumstances, it is appropriate for an entity to adjust the valuation of its inventories because its own investment in production machinery is inferior to its competitor's and this situation existed at the end of the reporting period.

(c) Price reductions caused by the introduction of an improved competitive product

It is unlikely that a competitor developed and introduced an improved product overnight. Therefore, it is correct to adjust the valuation of inventories held at the end of the reporting period to their NRV after that introduction because the entity's failure to maintain its competitive position in relation to product improvements existed at the end of the reporting period.

Competitive pressures that caused a decrease in NRV after the reporting period are generally additional evidence of conditions that developed over a period and existed at the end of the reporting period. Consequently, their effects normally require adjustment in the financial statements.

However, for certain types of inventory, there is clear evidence of a price at the end of the reporting period and it is inappropriate to adjust the price of that inventory to reflect a subsequent decline. An example is inventories for which there is a price on an appropriate commodities market. In addition, inventory may be physically damaged or destroyed after the reporting period (e.g. by fire, flood, or other disaster). In these cases, the entity does not adjust the financial statements. However, the entity may be required to disclose the subsequent decline in NRV of the inventories if the impact is material (see 2.3 above).

3.2 Percentage of completion estimates

Events after the reporting period frequently give evidence about the profitability of revenue from contracts with customers, where revenue is measured over time, that are in progress at the end of the reporting period.

IFRS 15 – *Revenue from Contracts with Customers* – requires an assessment to be made of the progress towards complete satisfaction of performance obligations satisfied over time (see Chapter 30 at 3). *[IFRS 15.40]*. In such an assessment, consideration should be given to events that occur after the reporting period and a determination should be made as to whether they are adjusting or non-adjusting events for which the financial effect is included in the method used to measure progress over time or the percentage of completion method.

3.3 Insolvency of a debtor and IFRS 9 expected credit losses

The insolvency of a debtor or inability to pay debts usually builds up over a period. Consequently, if a debtor has an amount outstanding at the end of the reporting period and this amount is written off because of information received after the reporting period, the event is normally adjusting. IAS 10 states that the bankruptcy of a customer that occurs after the reporting period usually confirms that the customer was credit-impaired (Stage 3 under the IFRS 9 general approach – refer to Chapter 51 at 3.1) at the end of the reporting period. *[IAS 10.9(b)(i)]*. If, however, there is evidence to show that the insolvency of the debtor resulted solely from an event occurring after the reporting period, then the event is a non-adjusting event. If the impact is material, the entity will be required to disclose the nature and effect of the debtor's default (see 2.3 above).

In April 2015 the IFRS Transition Resource Group for Impairment of Financial Instruments (ITG) discussed whether, and if so how, to incorporate events and forecasts that occur between the reporting date and the date the financial statements are authorised for issue, when applying the impairment requirements of IFRS 9 at the reporting date. The ITG noted that if new information becomes available between the reporting date and the date of signing the financial statements, an entity needs to apply judgement, based on the specific facts and circumstances, to determine whether it is an adjusting or non-adjusting event in accordance with IAS 10. This is further discussed in Chapter 51 at 5.9.4.

3.4 Valuation of investment property at fair value and tenant insolvency

The fair value of investment property reflects, among other things, the quality of tenants' covenants and the expected future rental income from the property. If a tenant ceases to be able to meet its lease obligations due to insolvency after the reporting period, an entity considers how this event is reflected in the financial statements at the end of the reporting period.

IAS 40 – *Investment Property* – requires the fair value of investment property, when measured in accordance with IFRS 13 – *Fair Value Measurement*, to reflect, among other things, rental income from current leases and other assumptions that market participants would use when pricing investment property under current market conditions. *[IAS 40.40]*. In addition, professional valuations generally reference the state of the market at the date of valuation without the use of hindsight. Consequently, the insolvency of a tenant is not normally an adjusting event to the fair value of the investment property because the investment property still holds value in the market. However, it would generally be indicative of an adjusting event for any rent receivable from that tenant. This conclusion is consistent with the treatment of investment property measured using the alternative cost model.

IAS 10 states that a decline in fair value of investments after the reporting period and before the date the financial statements are authorised for issue is a non-adjusting event, as the decline does not normally relate to a condition at the end of the reporting period (see 2.1.3 above). This decline in fair value, however, may be required to be disclosed if material (see 2.3 above). *[IAS 10.11]*.

3.5 Discovery of fraud after the reporting period

When fraud is discovered after the reporting date the implications on the financial statements should be considered. *[IAS 10.9(e)]*. In particular, it should be determined whether the fraud is indicative of a prior period error, and that financial information should be restated, or merely a change in estimate requiring prospective adjustment. Application of the IAS 8 definitions of a 'prior period error' and a 'change in accounting estimate' (see Chapter 3 at 4.5 and 4.6) in the case of a fraud requires the exercise of judgement. The facts and circumstances are evaluated to determine if the discovery of the fraud resulted from a previous failure to use, or misuse of, reliable information; or from new information. If the fraud meets the definition of a prior period error, the fraud would be an adjusting event as it relates to conditions that existed at the end of the reporting period. However, if the fraud meets the definition of a change in estimate, the facts and circumstances are evaluated to determine if the discovery of the fraud provides evidence of circumstances that existed at the end of the reporting period (i.e. an adjusting event) or circumstances that arose after that date (i.e. a non-adjusting event). Determining this is a complex task and requires judgement and careful consideration of the specifics to each case.

3.6 Changes to estimates of uncertain tax treatments

IFRIC 23 addresses how to reflect uncertainty in accounting for income taxes. It requires an entity to reassess any judgement or estimate relating to an uncertain tax treatment if the facts and circumstances on which the judgement or estimate was based change, or as a result of new information that affects the judgement or estimate. In cases where the change in facts and circumstances or new information occurs after the reporting period, the Interpretation requires an entity to apply IAS 10 to determine whether the change gives rise to an adjusting or non-adjusting event, as set out above at 2.1.2 and 2.1.3. *[IFRIC 23.13, 14]*.

Examples of changes in facts and circumstances or new information that could result in the reassessment of a judgement or estimate required by IFRIC 23 include, but are not limited to, the following:

(a) examinations or actions by a taxation authority. For example:
   (i) agreement or disagreement by the taxation authority with the tax treatment or a similar tax treatment used by the entity;
   (ii) information that the taxation authority has agreed or disagreed with a similar tax treatment used by another entity; and
   (iii) information about the amount received or paid to settle a similar tax treatment;

(b) changes in rules established by a taxation authority; and

(c) the expiry of a taxation authority's right to examine or re-examine a tax treatment. *[IFRIC 23.A2]*.

A change in rules established by a taxation authority after the reporting period constitutes a non-adjusting event. *[IAS 10.22(h)]*. An entity should apply IAS 10 to determine whether any other change that occurs after a reporting period is an adjusting or non-adjusting event. The requirements of IFRIC 23 are further discussed in Chapter 33 at 9.

Chapter 39 Related party disclosures

1 INTRODUCTION

Related party relationships and transactions between related parties are a normal feature of commerce and business. Many entities carry on their business activities through subsidiaries, joint ventures, and associates and there are inevitably transactions between these parties. The investor, in these circumstances, has the ability to affect the financial and operating policies of the investee. *[IAS 24.5]*. It is also common for entities under common control, which are not a group for financial reporting purposes, to transact with each other. The disclosures considered necessary in such circumstances are addressed by IAS 24 – *Related Party Disclosures*.

1.1 The related party issue

The problems posed by related party relationships and transactions are described in IAS 24 as follows:

> 'A related party relationship could have an effect on the profit or loss and financial position of an entity. Related parties may enter into transactions that unrelated parties would not. For example, an entity that sells goods to its parent at cost might not sell on those terms to another customer. Also, transactions between related parties may not be made at the same amounts as between unrelated parties.
>
> The profit or loss and financial position of an entity may be affected by a related party relationship even if related party transactions do not occur. The mere existence of the relationship may be sufficient to affect the transactions of the entity with other parties. For example, a subsidiary may terminate relations with a trading partner on acquisition by the parent of a fellow subsidiary engaged in the same activity as the former trading partner. Alternatively, one party may refrain from acting because of the significant influence of another – for example, a subsidiary may be instructed by its parent not to engage in research and development.' *[IAS 24.6-7]*.

1.2 Possible solutions

1.2.1 Remeasurement of related party transactions at fair values

In response to the problem posed by related party transactions, IAS 24 requires disclosure of those transactions, rather than an adjustment to the financial statements.

IAS 24 is purely a disclosure standard and does not establish any recognition or measurement requirements. Related party transactions are accounted for in accordance with the requirements of the IFRS applicable to the transaction. The disclosures required by IAS 24 are in addition to those required by other IFRSs. For example, a loan to a related party will also be subject to the disclosure requirements of IFRS 7 – *Financial Instruments: Disclosures.* This treatment of related party transactions and relationships using disclosure, rather than requiring adjustment, is in line with accounting standards internationally.

The purpose of disclosing information required by IAS 24 is to give users of the financial statements knowledge about transactions (for example, whether they are at fair value), outstanding balances, including commitments, and relationships with related parties that may affect their assessment of an entity's operations, including assessments of the risks and opportunities facing an entity. *[IAS 24.8].*

An alternative solution to the problems posed by related party relationships and transactions would be to adjust the financial statements to value related party transactions as if they occurred with an independent third party and recognise any such transactions at an arm's length price (i.e. fair value). However, although it may be possible to do this, it is often not possible to establish what would have been the terms of any non-arm's length transaction, had it been negotiated on an arm's length basis. This is because no comparable transactions may have taken place and, in any event, the transaction might never have taken place at all if it had been negotiated at a different value.

2 REQUIREMENTS OF IAS 24

2.1 Objective and scope

2.1.1 Objective

IAS 24 states that its objective 'is to ensure that an entity's financial statements contain the disclosures necessary to draw attention to the possibility that its financial position and profit or loss may have been affected by the existence of related parties and by transactions and outstanding balances, including commitments, with such parties'. *[IAS 24.1].*

Accordingly, IAS 24 requires disclosure of related party transactions and outstanding balances, including commitments, together with the names of any parties who control the reporting entity.

2.1.2 Scope

IAS 24 applies in:

(a) identifying related party relationships and transactions;

(b) identifying outstanding balances, including commitments, between an entity and its related parties;

(c) identifying the circumstances in which disclosure of the items in (a) and (b) is required; and

(d) determining the disclosures to be made about those items. *[IAS 24.2].*

IAS 24 explicitly requires disclosure of related party relationships, transactions and outstanding balances, including commitments, in both the consolidated and separate financial statements of a parent or investors with joint control of, or significant influence over, an investee presented in accordance with IFRS 10 – *Consolidated Financial Statements* – or IAS 27 – *Separate Financial Statements*. The standard also applies to individual financial statements. *[IAS 24.3]*.

All entities within a group that prepare their financial statements under IFRS must disclose related party transactions and outstanding balances with other entities in the group in the entity's own financial statements. *[IAS 24.4]*. There are no disclosure exemptions for subsidiaries, or for parent companies that produce separate financial statements even where those separate financial statements are issued with the consolidated financial statements of the group of which they are a part. The IASB considers that the financial statements of an entity that is part of a consolidated group may include the effects of extensive intragroup transactions. Therefore, it concluded that the disclosures required by IAS 24 are essential to understanding the financial position and financial performance of such an entity and should be required for separate financial statements presented in accordance with IAS 27. The IASB also believes that disclosure of intragroup transactions is essential because external users of the financial statements need to be aware of the interrelationships between related parties, including the level of support provided by related parties, to assist in their economic decisions. *[IAS 24.BC16-17]*.

IAS 24 notes that 'intragroup related party transactions and outstanding balances are eliminated in the preparation of consolidated financial statements of the group'. *[IAS 24.4]*. This implies that disclosure of such transactions and balances is not required in the group's consolidated financial statements since, so far as those financial statements are concerned, such items do not exist. This would also apply to the parts of a transaction which have been eliminated when applying equity accounting. However, transactions and balances between an investment entity and those of its subsidiaries, held as part of an investment portfolio that are measured at fair value through profit or loss and not consolidated in accordance with IFRS 10 should be disclosed in the consolidated financial statements. *[IAS 24.4]*.

Some jurisdictions may have local laws and regulations which require specific information to be disclosed about particular related party transactions. These local requirements should be seen as a complement to, and not a substitute for, the disclosure requirements of IAS 24.

2.2 Identification of a related party and related party transactions

A related party is defined as 'a person or entity that is related to the entity that is preparing its financial statements (the "reporting entity")'. *[IAS 24.9]*. The definition of related parties is reciprocal. The use of the word 'party' means that the disclosure applies to both individuals and to entities. The factors considered in the identification of a related party is consistent whether the controlling party is a person or an entity.

With regard to entities, IAS 24 defines related parties more widely than simply the members of a group (as defined in Appendix A of IFRS 10, i.e. a parent and its subsidiaries). The definition includes joint ventures and associates of the parent (that are related to the subsidiaries of the parent), joint ventures and associates of a parent's subsidiary (that are related to the subsidiaries of the parent) and subsidiaries of an associate or a joint venture (that are related to the parent).

IAS 24 contains a multi-part definition of 'related party' and the following are considered to be related parties of the reporting entity:

- certain persons or a close member of that person's family (see 2.2.1 below);
- entities that are members of the same group (see 2.2.2 below);
- entities that are associates or joint ventures (see 2.2.3 below);
- entities that are joint ventures of the same third party (see 2.2.4 below);
- entities that are joint ventures of a third party and associates of the same third entity (see 2.2.5 below);
- post-employment benefit plans (see 2.2.6 below);
- entities under control or joint control of certain categories of persons or close members of such a person's family (see 2.2.7 below);
- entities under significant influence of certain categories of persons or close members of such a person's family (including a person who is a member of a key management personnel of the entity or of a parent of the entity) (see 2.2.8 below);
- entities, or any member of the group of which they are a part, that provide key management personnel services (see 2.2.9 below); and
- government-related entities (see 2.2.10 below).

The standard emphasises that attention should be directed to the substance of the relationship and not merely the legal form. *[IAS 24.10]*.

A related party transaction is a transfer of resources, services or obligations between a reporting entity and a related party, regardless of whether a price is charged. *[IAS 24.9]*.

2.2.1 Persons or close members of a person's family that are related parties

A person or close member of that person's family is related to a reporting entity if that person:

(i) has control or joint control over the reporting entity;

(ii) has significant influence over the reporting entity; or

(iii) is a member of the key management personnel of the reporting entity or of a parent of the reporting entity. *[IAS 24.9]*.

Close members of a family of a person are defined as 'those family members who may be expected to influence, or be influenced by, that person in their dealings with the entity' and include:

(a) that person's children and spouse or domestic partner;

(b) children of that person's spouse or domestic partner; and

(c) dependants of that person or that person's spouse or domestic partner. *[IAS 24.9]*.

The Interpretations Committee confirmed in May 2015 that the definition appears to provide no scope to argue that there are circumstances in which the specific family members described in (a) to (c) above are not related parties. Dependants are not limited to children and may include other relatives depending on the facts and circumstances.

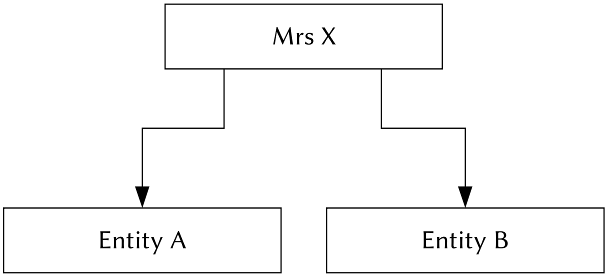
The Interpretations Committee observed that the definition of close members of the family of a person:

- is expressed in a principle-based manner and involves the use of judgement to determine whether members of the family of a person (including that person's parents) are related parties or not; and
- includes a list of family members that are always considered close members of the family of a person.

The Interpretations Committee further noted that the list of family members that are always considered 'close members' is non-exhaustive and does not preclude other family members from being considered as close members of the family of a person. Consequently, other family members, including parents or grandparents, could qualify as close members of the family depending on the assessment of specific facts and circumstances. Therefore, the Interpretations Committee determined that neither an Interpretation nor an amendment to IAS 24 was necessary and therefore decided not to add this issue to its agenda.[1]

Relationships involving a person or close family members as investors are illustrated in the following examples, which are based on illustrative examples published by the IASB, which accompany, but are not part of IAS 24.

Example 39.1: Person as investor



Mrs X has an investment in Entity A and Entity B.

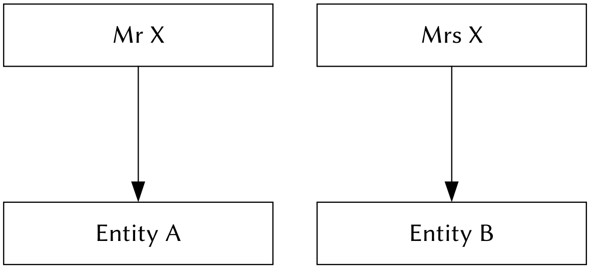
For Entity A's financial statements, if Mrs X controls or jointly controls Entity A, Entity B is related to Entity A when Mrs X has control, joint control or significant influence over Entity B or is a member of Entity B's key management personnel.

For Entity B's financial statements, if Mrs X controls or jointly controls Entity A, Entity A is related to Entity B when Mrs X has control, joint control or significant influence over Entity B, or is a member of Entity's A key management personnel.

However, if Mrs X has significant influence over both Entity A and Entity B, Entities A and B are not related to each other.

If Mrs X is a member of the key management personnel of both Entity A and Entity B, Entities A and B are not, in the absence of any other indicator of a related party relationship, related to each other (see 2.3 below).

Example 39.2: Close members of the family holding investments



Mr X is the spouse of Mrs X. Mr X has an investment in Entity A and Mrs X has an investment in Entity B.

For Entity A's financial statements, if Mr X controls or jointly controls Entity A, Entity B is related to Entity A when Mrs X has control, joint control or significant influence over Entity B, or is a member of Entity B's management personnel.

For Entity B's financial statements, if Mr X controls or jointly controls Entity A, Entity A is related to Entity B when Mrs X has control, joint control or significant influence over Entity B, or is a member of Entity A's key management personnel.

If Mr X has significant influence (but not control or joint control) over Entity A and Mrs X has significant influence (but not control or joint control) over Entity B, Entities A and B are not related to each other (see 2.3 below).

If Mr X is a member of the key management personnel of Entity A and Mrs X is a member of the key management personnel of Entity B, Entities A and B are not, in the absence of any other indicator of a related party relationship, related to each other (see 2.3 below).

2.2.1.A Control

The definition of 'control' in IAS 24 is a cross-reference to the definition in IFRS 10. IFRS 10 states that 'an investor controls an investee when the investor is exposed, or has rights, to variable returns from its involvement with the investee and has the ability to affect those returns through its power over the investee'. *[IFRS 10 Appendix A]*.

2.2.1.B Joint control

The definition of 'joint control' in IAS 24 is a cross-reference to the definition in IFRS 11 – *Joint Arrangements*. IFRS 11 defines joint control as 'the contractually agreed sharing of control of an arrangement, which exists only when decisions about the relevant activities require the unanimous consent of the parties sharing control'. *[IFRS 11 Appendix A]*.

In the definition of a related party, a joint venture includes subsidiaries of the joint venture. *[IAS 24.12]*. Therefore, for example, the subsidiary of a joint venture and the investor who has joint control are related to each other.

2.2.1.C Significant influence

The definition of 'significant influence' in IAS 24 is a cross-reference to the definition in IAS 28 – *Investments in Associates and Joint Ventures*. IAS 28 defines significant influence as 'the power to participate in the financial and operating policy decisions of the investee but is not control or joint control of those policies'. *[IAS 28.3]*.

In the definition of a related party, an associate includes subsidiaries of the associate. Therefore, for example, the subsidiary of an associate and the investor who has significant influence over the associate are related to each other. *[IAS 24.12]*.

2.2.1.D Key management personnel

'Key management personnel' are those persons with authority and responsibility for planning, directing and controlling the activities of an entity, directly or indirectly, including any director (whether executive or otherwise) of that entity. *[IAS 24.9]*. A director of a reporting entity is normally automatically a member of key management personnel, even if they are not paid for their services by the reporting entity – thus a director of a subsidiary is still a member of key management personnel of the subsidiary, even if their services are paid for by the parent.

A related party includes all key management personnel of a reporting entity and of a parent of the reporting entity. This means that all key management personnel of all parents (i.e. the immediate parent, any intermediate parent and the ultimate parent) of a reporting entity are related parties of the reporting entity. When the reporting entity's financial statements represent a group, key management personnel of subsidiaries might not be key management personnel of the group if those persons do not participate in the management of the group.

Some entities may have more than one level of key management. For example, some entities may have a supervisory board, whose members have responsibilities similar to those of non-executive directors, as well as a board of directors that sets the overall operating strategy. All members of either board are therefore considered key management personnel.

The definition of key management personnel is not restricted to directors. It also includes other individuals with authority and responsibility for planning, directing and controlling the activities of an entity. The main intention of the definition is presumably to ensure that transactions with persons with responsibilities similar to those of directors, and the compensation paid to such persons, do not escape disclosure simply because they are not directors. Otherwise, there would be an obvious loophole in the standard. For example, in some jurisdictions, a chief financial officer or a chief operating officer may not be directors but could meet the definition of key management personnel. Other examples of the type of persons who are not directors but may meet the definition of key management personnel include a divisional chief executive or a director of a major trading subsidiary of the entity, but not of the entity itself, who nevertheless participates in the management of the reporting entity. A reference to individuals who are not directors in a reporting entity's business review or management discussion and analysis might indicate that those persons are considered to be key management personnel.

'Key management personnel' are normally employees of the reporting entity (or of another entity in the same group). However, the definition does not restrict itself to employees. Therefore, seconded staff and persons engaged under management or outsourcing contracts may also have a level of authority or responsibility such that they are 'key management personnel'.

The definition of key management personnel refers to 'persons'. In some jurisdictions, the term 'person' includes both a 'corporate person' and a 'natural person'. Additionally, in some jurisdictions, a corporate entity must by law have the authority and responsibility for planning, directing and controlling the activities of an investment fund for the benefit of the fund's investors in accordance with the fund's constitution and relevant statutes (i.e. the corporate entity is the body acting as key management personnel). IAS 24 clarifies that if a reporting entity receives key management personnel services from another entity (described as a 'management entity') the disclosure requirements for key management personnel compensation (see 2.2.9 below) do not apply to the compensation paid or payable by the management entity to the management entity's employees or directors. *[IAS 24.17A]*. Instead, amounts incurred for the service fee paid or payable by the reporting entity to the separate management entity for provision of key management personnel services are disclosed. *[IAS 24.18A]*. As a result of identifying the management entity as a related party of the reporting entity, other transactions with the management entity, such as loans, are also disclosed by the reporting entity.

2.2.2 Entities that are members of the same group

'An entity is related to a reporting entity if:

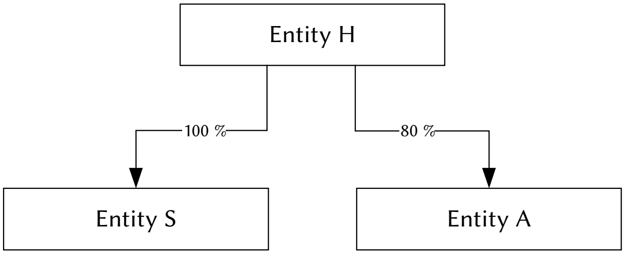
(i) The entity and the reporting entity are members of the same group (which means that each parent, subsidiary and fellow subsidiary is related to the others).' *[IAS 24.9(b)]*.

The terms group, parent and subsidiary are defined in IFRS as follows:

- a group is 'a parent and its subsidiaries';
- a parent is 'an entity that controls one or more entities'; and
- a subsidiary as 'an entity that is controlled by another entity'. *[IFRS 10 Appendix A]*.

Therefore, all entities controlled by the same ultimate parent are related parties. This would include entities where the reporting entity holds less than a majority of the voting rights but which are subsidiaries as defined in IFRS 10. Conversely, a group would not include entities where the reporting entity holds a majority of the voting rights but which are not subsidiaries (e.g. because the group does not have control), though these are likely to be related parties of the reporting entity as they may fall into other categories of related party, such as associates.

Example 39.3: Entities that are members of the same group



Entities H, S and A are all related parties to each other as they are members of the same group. Both Entity S and Entity A are subsidiaries of Entity H.

Related party disclosures will be required in the financial statements of Entity S in respect of transactions with Entities H and A, in the financial statements of Entity A in respect of transactions with Entities H and S and in the separate financial statements of Entity H in respect of transactions with Entities S and A.

2.2.3 Entities that are associates or joint ventures

'An entity is related to a reporting entity if:

...

(ii) One entity is an associate or joint venture of the other entity (or an associate or joint venture of a member of a group of which the other entity is a member).' *[IAS 24.9(b)]*.

The terms associate and joint venture are defined in IAS 28 and IFRS 11.

IAS 28 defines an associate as 'an entity over which the investor has significant influence'. *[IAS 28.3]*.

IFRS 11 defines a joint venture as 'a joint arrangement whereby the parties that have joint control of the arrangement have rights to the net assets of the arrangement'. *[IFRS 11 Appendix A]*.

Any entity that a reporting entity determines is an associate under IAS 28 or a joint venture under IFRS 11 is a related party. All associates and joint ventures are related parties regardless as to whether they are accounted for under the equity method or by another method. For example, investments in associates or joint ventures held by a venture capital organisation, mutual fund, unit trust or similar entity including unit-linked insurance funds are related parties, even where the investment is accounted for at fair value through profit or loss under IFRS 9 – *Financial Instruments* – rather than under the equity method. Likewise, any reporting entity that is an associate or joint venture of another entity must treat that investor entity as a related party.

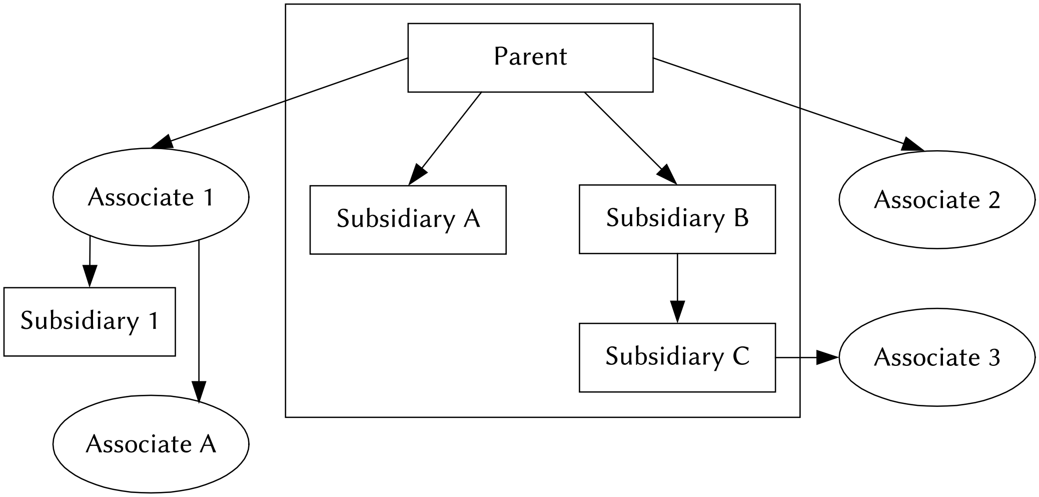
As noted above, in the definition of a related party, an associate includes subsidiaries of the associate and a joint venture includes subsidiaries of the joint venture. Therefore, for example, an associate's subsidiary and the investor that has significant influence over the associate are related to one another. *[IAS 24.12]*.

The definition also means that an associate of a reporting entity's parent is also a related party of the reporting entity.

However, the definition does not cause investors in a joint venture or an associate to be related to each other (see 2.3 below). Investors in joint operations (as defined in IFRS 11) are also not related to each other. For the avoidance of doubt, two associates of the same third party are not related to one another (see 2.2.4 below).

The application of these requirements is illustrated in the example below, which is based on an illustrative example accompanying IAS 24. The example mainly focuses on the application of the requirements to associate entities.

Example 39.4: Associates of the reporting entity's group that are related parties



In Parent's separate financial statements, Associates 1 (including its subsidiary), 2 and 3 are related parties. For Parent's consolidated financial statements, Associates 1 (including its subsidiary), 2 and 3 are related to the group.

For Subsidiary A's financial statements, Associates 1 (including its subsidiary), 2 and 3 are related parties. For Subsidiary B's consolidated or separate financial statements, Associates 1 (including its subsidiary), 2 and 3 are related parties. For Subsidiary C's financial statements, Associates 1 (including its subsidiary), 2 and 3 are related parties.

For the financial statements of Associates 1 (consolidated or separate), 2 and 3, Parent and Subsidiaries A, B and C are related parties. Associates 1, 2 and 3 are not related to each other. In addition, for the separate financial statements of Associate 1, Subsidiary 1 and Associate A are also related and for the consolidated financial statements of Associate 1, Associate A is related.

For the financial statements of Subsidiary 1, Associate 1, Associate A, Parent and Subsidiaries A, B and C are related parties. For the financial statements of Associate A, Associate 1 and Subsidiary 1 are related.

2.2.3.A Joint operations

IAS 24 defines 'joint ventures' of the reporting entity as related parties. The definition of a joint venture in IFRS 11 excludes joint operations, so that an investment in a joint operation is not a related party.

The exclusion of joint operations in is line with the IASB view that joint operations are part of the reporting entity and therefore a transaction with a joint operation is either a transaction by the reporting entity with itself or a transaction with the other joint operator which would not be a related party unless it otherwise met the related party definition in IAS 24 for some other reason (e.g. because it was an entity controlled by a member of key management personnel). *[IFRS 12.BC52]*.

2.2.4 Entities that are joint ventures of the same third party

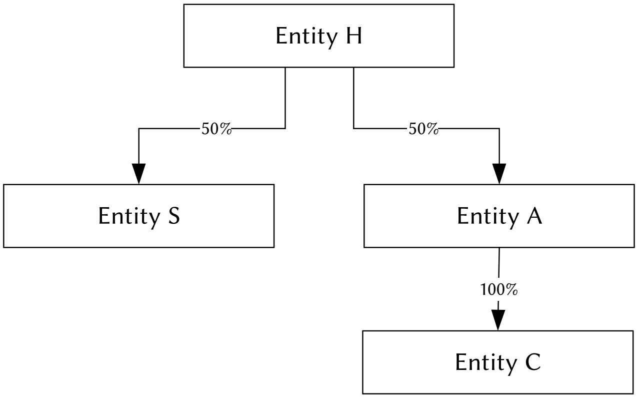
'An entity is related to a reporting entity if:

...

(iii) Both entities are joint ventures of the same third party.' *[IAS 24.9(b)]*.

This is illustrated by the following example:

Example 39.5: Entities that are joint ventures of the same third party



In this example, Entities S and A are joint ventures of Entity H and are therefore related parties. Entity C, as a subsidiary of Entity A, is also a related party of Entity H and Entity S.

If, however, Entities S and A were only associates (rather than joint ventures) of the same third party then they would not be related parties. In the Basis for Conclusions to IAS 24, it was explained that a distinction was made between joint ventures and associates because the IASB considered that 'significant influence' was not as close a relationship as control or joint control. *[IAS 24.BC19(a)]*.

As noted above, in the definition of a related party, a joint venture includes subsidiaries of the joint venture. Therefore a joint venture's subsidiary and the investor that has joint control over the joint venture are related to each other. *[IAS 24.12]*.

2.2.5 Entities that are joint ventures of a third party and associates of the same third entity

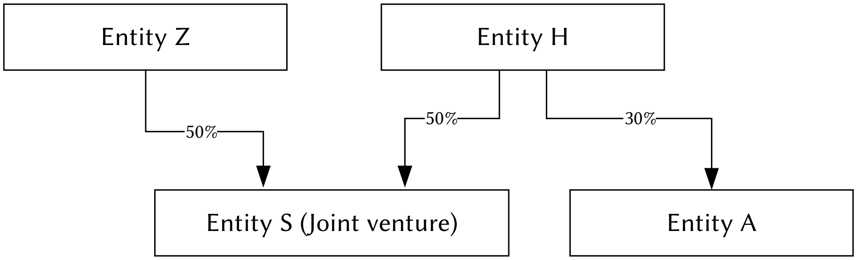
'An entity is related to a reporting entity if:

...

(iv) One entity is a joint venture of a third entity and the other entity is an associate of the third entity.' *[IAS 24.9(b)]*.

This definition treats joint ventures in a similar manner to subsidiaries as illustrated in Examples 39.3 and 39.5 above and therefore an associate and a joint venture are related parties where they share the same investor. This is illustrated in the example below:

Example 39.6: Entities that are joint ventures and associates of the same third entity



Entity S is a joint venture of Entity H and Entity A is an associate of Entity H. Therefore, Entities S and A are related parties.

However, Entities Z and H are not related parties (see 2.3 below).

2.2.6 Post-employment benefit plans

'An entity is related to a reporting entity if:

...

(v) The entity is a post-employment benefit plan for the benefit of employees of either the reporting entity or an entity related to the reporting entity. If the reporting entity is itself such a plan, the sponsoring employers are also related to the reporting entity.' *[IAS 24.9(b)]*.

The definition is quite wide-ranging and includes post-employment benefit plans of any entity related to the reporting entity. This includes, for example, post-employment benefit plans of an associate or joint venture of the reporting entity or a post-employment benefit plan of an associate of the reporting entity's parent.

The related party relationship would not extend to investment managers of the pension fund, provided that their acting for the fund was the only relationship. Any fees paid by the sponsoring employers (for example, to the investment manager) on behalf of the pension fund would be a related party transaction. 'Sponsoring employers' is not defined in IFRS, but is generally taken to mean the entity which has a legal duty to ensure that funds are available in the pension fund when the payment of pensions falls due.

Sponsoring employers are also related parties of a post-employment benefit plan.

2.2.7 Entities under control or joint control of certain persons or close members of their family

An entity is related to a reporting entity if:

...

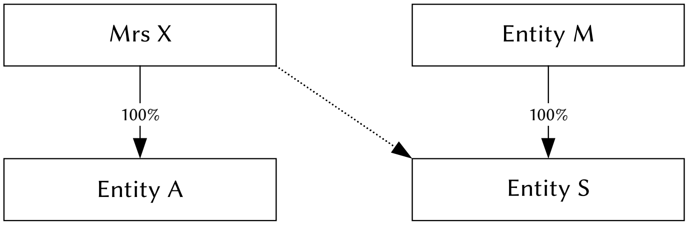
(vi) The entity is controlled or jointly controlled by a person or close member of that person's family who has control or joint control over the reporting entity, has significant influence over the reporting entity or is a member of key management personnel of the reporting entity or of a parent of the reporting entity. *[IAS 24.9]*.

This is intended to cover situations in which an entity is controlled or jointly controlled by a person or close family member of that person and that person or close family member also controls, jointly controls, has significant influence over, or is a member of key management personnel of, the reporting entity or of a parent of the reporting entity. The situation whereby one company owns another is covered by Example 39.3 above.

This is illustrated below:

Example 39.7: Persons who control an entity and are a member of the key management personnel of another entity

Mrs X has a 100% investment in Entity A and is a member of the key management personnel of Entity S. Entity M has a 100% investment in Entity S.



For Entity S's financial statements, Entity A is related to Entity S because Mrs X controls Entity A and is a member of the key management personnel of Entity S.

For Entity S's financial statements, Entity A is also related to Entity S if Mrs X is a member of the key management personnel of Entity M and not of Entity S.

This outcome would be the same if Mrs X has joint control over Entity A (if Mrs X only had significant influence over Entity A and not control or joint control then Entities A and S would not be related parties).

For Entity A's financial statements, Entity S is related to Entity A because Mrs X controls Entity A and is a member of Entity S's key management personnel. This outcome would be the same if Mrs X has joint control over Entity A and would further be the same if Mrs X is a member of the key management personnel of Entity M rather than Entity S (see 2.2.8 below). Note that Entity M would also be a related party of Entity A in this instance.

For Entity M's consolidated financial statements, Entity A is a related party of the Group if Mrs X is a member of the key management personnel of the Group.

For Entity M's separate financial statements, Entity S is a related party. Further, Entity A will be a related party if Mrs X is a member of the key management personnel of Entity M.

2.2.8 Entities under significant influence of certain persons or close members of their family

An entity is related to a reporting entity if:

...

(vii) A person or a close family member of that person who has control or joint control over the reporting entity has significant influence over the entity or is a member of the key management personnel of the entity (or of a parent of the entity). *[IAS 24.9(b)]*.

This is the reciprocal of 2.2.7 and is illustrated in Example 39.7 above.

Entities that are significantly influenced by the same person or close member of that person's family or who simply share the same key management personnel are not related parties in the absence of any control or joint control by those persons (see 2.3 below).

2.2.9 Entities, or any member of the group of which they are a part, that provide key management personnel services

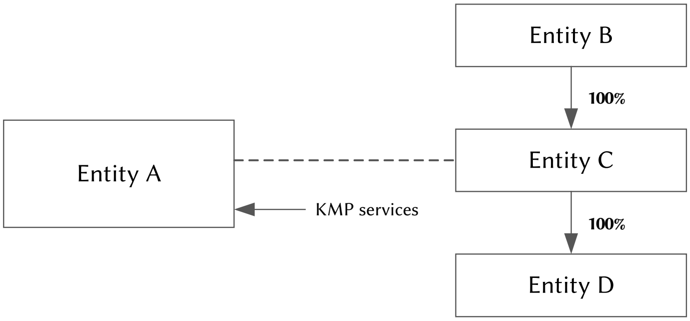
'An entity is related to a reporting entity if:

...

(viii) The entity, or any member of a group of which it is a part, provides key management personnel services to the reporting entity or to the parent of the reporting entity.' *[IAS 24.9(b)]*.

This is intended to cover situations in which an entity (described as a 'management entity'), or a member of its group, provides key management personnel services to the reporting entity (see 2.6 and 2.8 below) and is most commonly seen in the fund management sector. It applies to the provision of key management personnel services by the separate management entity. Staff acting for the management entity that are responsible for planning, directing and controlling the activities of the reporting entity are not considered to be key management personnel of the reporting entity. It is not necessary to look through the management entity to determine natural persons as key management personnel. *[IAS 24.17A]*.

Example 39.8: Entities that provide key management personnel services to a reporting entity



Entity C provides key management personnel services to Entity A. For Entity A's financial statements, Entities B, C and D are all related parties.

Entity A is not a related party of Entities B, C and D. The related party relationship between the management entity and the reporting entity is not symmetrical. In the absence of any other indicator of a related party relationship, the reporting entity (Entity A) cannot affect the management entity's (Entity C's) activities, financial position or profit or loss.

2.2.10 Government-related entities

A 'government-related entity' is an entity that is controlled, jointly controlled or significantly influenced by a government. *[IAS 24.9]*.

'Government' in this context refers to government, government agencies and similar bodies whether local, national or international. *[IAS 24.9]*. This is the same as the definition used in IAS 20 – *Accounting for Government Grants and Disclosure of Government Assistance*. The Board decided that it would not provide a more comprehensive definition or additional guidance on how to determine what is meant by 'government'. In the Board's view, a more detailed definition could not capture every conceivable government structure across every jurisdiction. In addition, judgement is required by a reporting entity when applying the definition because every jurisdiction has its own way of organising government-related activities. *[IAS 24.BC41]*. This implies that there may well be diversity in practice across different jurisdictions in defining what is meant by 'government'. For jurisdictions with multiple levels of government, judgement may be needed about whether parties controlled by different levels of government are related (for example, state versus federal), notwithstanding that both controlling parties are government bodies.

Where an entity is controlled, jointly controlled or significantly influenced by a government then relationships, transactions and outstanding balances, including commitments, with that government are related party transactions. Similarly, transactions and outstanding balances, including commitments, with other entities controlled, jointly controlled or significantly influenced by that government are related party transactions. However, not all such transactions should be disclosed, only those that are individually significant to an understanding of the financial statements of the reporting entity. The factors to consider when assessing whether a transaction is individually significant are discussed at 2.9 below. Additionally, transactions may be for significant amounts but still be immaterial from an IAS 1 – *Presentation of Financial Statements* – perspective (e.g. telecommunication costs with a government-controlled operator when these are at market conditions).

Related party transactions with government-related entities are subject to certain disclosure exemptions. These are discussed at 2.9 below.

2.3 Parties that are not related parties

Having included such a detailed definition of related parties, IAS 24 clarifies that the following are not related parties:

- two entities simply because they have a director or other member of key management personnel in common or because a member of key management personnel of one entity has significant influence over the other entity;
- two venturers simply because they share joint control over a joint venture;
- providers of finance, trade unions, public utilities and departments and agencies of a government that do not control, jointly control or significantly influence the reporting entity, simply by virtue of their normal dealings with the entity (even though they may affect the freedom of action of an entity or participate in its decision-making process); and
- a customer, supplier, franchisor, distributor or general agent with whom an entity transacts a significant volume of business, simply by virtue of the resulting economic dependence. *[IAS 24.11]*.

The reason for these exclusions is that, without them, many entities that are not usually regarded as related parties could fall within the definition of related party. For example, a small clothing manufacturer selling 90% of its output to a single customer could be under the effective economic control of that customer.

These exclusions are effective only where these parties are 'related' to the reporting entity simply because of the relationship noted above. If there are other reasons why a party is a related party, the exclusions do not apply. Consider the following examples:

- A water company that supplies the reporting entity is not a related party if the only link between the two is the supply of water. If, however, the water company is also an associate of the reporting entity, the exclusion does not apply; the two are related parties, and the transactions relating to the supply of water are disclosed if material.
- Two investors in the same entity are not related parties simply because one holds a controlling interest and the other shareholder (not in the group) holds a non-controlling interest in a subsidiary of the group. Even if the investor holding the non-controlling interest exercises significant influence over the subsidiary, provided it is not otherwise related to the controlling investor, it is not normally a related party of the controlling investor. However, the non-controlling investor might have significant influence over the group if the subsidiary was significant to the group in which case the group, including the controlling investor and the non-controlling investor are related parties.
- Two entities are not related parties simply because they share common key management personnel. However, if the common member of key management personnel exerts control or joint control over one or more of the entities then they are related parties. See 2.2.7 or 2.2.8 above.
- An administrator, custodian, broker and fund manager of the same fund are not related parties, to each other or to the fund to which they provide services simply because they each provide services to the fund, even if any of the parties are economically dependent upon the income from such services. However, any such party could meet the definition of 'key management personnel' of the fund if it provides key management personnel services (see 2.2.9 above). In addition, any shared ownership (e.g. control, joint control, or significant influence) between such parties should be evaluated to determine if the parties are related.

An interest in an unconsolidated structured entity as defined by IFRS 12 – *Disclosure of Interests in Other Entities* – held by a reporting entity does not make the structured entity a related party to the reporting entity unless it would otherwise meet the definition of a related party (e.g. because the structured entity is an associate of the reporting entity).

2.4 Disclosure of controlling relationships

IAS 24 asserts that, in order to enable users of financial statements to form a view about the effects of related party relationships on an entity, it is appropriate to disclose the related party relationship when control exists, irrespective of whether there have been transactions between the related parties. *[IAS 24.14]*. Accordingly, IAS 24 requires an entity to disclose:

- the name of its parent; and, if different
- the ultimate controlling party.

If neither the entity's parent nor the ultimate controlling party produces consolidated financial statements available for public use, the name of the next most senior parent that does so must also be disclosed. *[IAS 24.13]*.

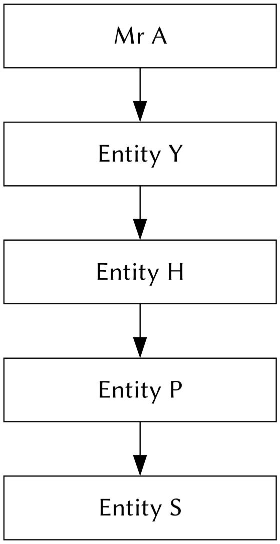
The 'next most senior parent' is the first parent in the group above the immediate parent that produces consolidated financial statements available for public use. *[IAS 24.16]*. Consequently, in some circumstances, an entity may need to disclose the names of three parents.

Disclosure must be made even if the parent or ultimate controlling party does not prepare financial statements. In the situation when the ultimate controlling party is an individual, rather than an entity, the reporting entity is likely to have to disclose the name of the next most senior parent in addition since the individual undoubtedly does not produce financial statements for public use. IAS 1 also requires disclosure of the 'ultimate parent' of the group. *[IAS 1.138(c)]*. This is not necessarily synonymous with the 'ultimate controlling party' where that party is an individual. This is illustrated in the example below.

Example 39.9: Disclosure of parent, ultimate parent and ultimate controlling party

Entity S is controlled by Entity P which in turn is controlled by Entity H which in turn is controlled by Entity Y. The ultimate controlling party of Entity Y is Mr A. Entities P and Y do not produce consolidated financial statements available for public use.

The group structure is illustrated as follows:



For Entity S's financial statements, IAS 24 requires disclosure of Entity P (the parent), Entity H (the next most senior parent that produces consolidated financial statements available for public use) and Mr A (the ultimate controlling party). In addition, IAS 1 requires disclosure of Entity Y (the ultimate parent of the group).

For Entity P's financial statements, IAS 24 requires disclosure of Entity H (the parent) and Mr A (the ultimate controlling party). In addition, IAS 1 requires disclosure of Entity Y (the ultimate parent of the group).

For Entity H's financial statements, IAS 24 requires disclosure of Entity Y (the parent) and Mr A (the ultimate controlling party). IAS 1 does not require any additional disclosure.

For Entity Y, IAS 24 requires disclosure of Mr A (ultimate controlling party).

The ultimate controlling party could be a group of individuals or entities acting together. IAS 24 is silent on the issue of individuals or entities acting together to exercise joint control. However, IFRS 3 – *Business Combinations* – states that a group of individuals can be regarded as a controlling party when, as a result of contractual arrangements, they collectively have the power to govern that entity's financial and operating policies so as to obtain benefits from its activities. *[IFRS 3.B2]*. In such circumstances, these entities or individuals should be identified as the controlling party. However, as discussed at 2.2 above, IAS 24 emphasises that attention should be directed to the substance of any related party relationship and not merely the legal form. It is likely that such an informal arrangement would at least give such individuals acting collectively significant influence over the reporting entity and as such, those individuals would be related parties to the reporting entity under IAS 24.

IAS 24 also clarifies that the requirement to disclose related party relationships between a parent and its subsidiaries is in addition to the disclosure requirements of IAS 27 and IFRS 12. *[IAS 24.15]*. IAS 27 requires a parent's separate financial statements to disclose:

- a list of the significant investments in subsidiaries, joint ventures and associates including the name, place of business (and, if different, country of incorporation);
- proportion of ownership interest (and if different, proportion of voting power held); and
- a description of the method used to account for such investments – see Chapter 8 at 3.1.

IFRS 12 requires an entity to disclose information to enable users to understand the composition of a group – see Chapter 13 at 4.1.

2.5 Disclosable transactions

A related party transaction is defined as 'a transfer of resources, services or obligations between a reporting entity and a related party, regardless of whether a price is charged.' *[IAS 24.9]*. Read literally, this definition requires many transactions to be disclosed more than once. For example, if an entity buys goods on credit from a related party and pays for them 30 days later, both the original purchase and the final payment represent a 'transfer of resources ... between a reporting entity and a related party' and, therefore on a literal reading, are required to be separately disclosed. However, we doubt that this reading is the IASB's intention, and the nature of the disclosures required by IAS 24 seems to support this view.

The definition of a related party transaction implies that transactions are disclosable only for the period in which parties are related. For example, where a reporting entity has disposed of a subsidiary during the reporting period, only transactions with the subsidiary up to the date of disposal are related party transactions in the financial statements of the reporting entity. Similarly, if a person became a member of key management personnel of a reporting entity during a reporting period, no disclosure is required of any remuneration paid to that person before that person's appointment as key management personnel. Likewise, transactions with a party in the comparative period are not disclosable as related party transactions if in the comparative period that party was not related to the reporting entity. Transactions with a party are not disclosable in the current year if the related party relationship had ceased before the beginning of the current period although, transactions in the comparative period are disclosed.

IAS 24 is unclear whether disclosure of outstanding balances at the reporting date is required in situations where an entity ceases to be a related party during the reporting period. In such situations, one view is that outstanding balances are not disclosable since the entity is not a related party as at the reporting date. A second view is that if the outstanding balances as at the reporting date comprise of amounts related to the transactions when the entities were related, such outstanding balances should be included in related party disclosures. In our view, either view is acceptable. However, if an entity becomes a related party during the year, outstanding balances as at the reporting date, that include amounts related to transactions entered into when the entities were unrelated, are disclosable.

In the case that entities become related after the reporting date, but before the financial statements were authorised for issue, it may be necessary to disclose the relationship, if it is considered by management to be a material non-adjusting event, in accordance with IAS 10 – *Events after the Reporting Period*. *[IAS 10.21]*.

There is no requirement in IAS 24 to disclose information about related party transactions in one comprehensive note. However, it may be more useful to users of the financial statements to present information this way.

IAS 1 requires that, except where a standard permits otherwise (which IAS 24 does not), comparative information in respect of the previous period must be disclosed for all amounts reported in the current period's financial statements. *[IAS 1.38]*. This applies to all transactions for which a related party relationship existed in the prior period, but, as noted above, does not apply to transactions with a party which only became related in the current period.

2.5.1 Materiality

In determining whether an entity discloses related party transactions in financial statements, the general concept of materiality is applied. IAS 24 does not refer specifically to materiality since this requirement is in IAS 1, which states that 'an entity need not provide a specific disclosure required by an IFRS if the information resulting from that disclosure is not material.' *[IAS 1.31]*. Omissions, misstatements or obscuring of information are material within IAS 1 'if it could reasonably be expected to influence decisions that the primary users of general purpose financial statements make on the basis of those financial statements, which provide financial information about a specific reporting entity. Materiality depends on the nature or magnitude of information, or both. An entity assesses whether information, either individually or in combination with other information, is material in the context of its financial statements taken as a whole.' *[IAS 1.7]*.

The nature of the qualitative aspect of materiality in respect of related party transactions is made explicit in the non-mandatory Practice Statement *Making Materiality Judgements*,[2] issued by the IASB Board in September 2017. The statement lists the involvement of a related party of the entity as an entity-specific qualitative materiality factor of an entity's transaction, other event or condition. It further explains that the presence of a qualitative factor lowers the thresholds for the quantitative assessment and that the more significant the qualitative factors, the lower the quantitative factors will be. *The Conceptual Framework for Financial Reporting*,[3] issued in March 2018, also emphasises that materiality is an entity-specific aspect of relevance, based on nature, magnitude or both and what could be material in a particular situation cannot be predetermined, nor can a uniform quantitative threshold be specified.

This qualitative aspect of materiality may have the effect that any related party transaction whose disclosure is considered sensitive (e.g. key management compensation or for tax reasons perhaps) is by definition material because it is expected by the reporting entity to influence a user of the financial statements. Therefore, it may not be possible to avoid disclosing such items on the grounds that they are quantitatively immaterial. In addition, a transaction conducted at advantageous terms to either the related party or the reporting entity is more likely to be material than one conducted at arm's length. Since IAS 24 requires disclosure of related party transactions irrespective of whether consideration is received, disclosure cannot be avoided on the argument that, since there is no consideration, the transaction must be immaterial.

2.6 Disclosure of key management personnel compensation

IAS 24 requires disclosure of key management personnel compensation including the amount of outstanding balances and commitments. Outstanding balances with key management personnel would include unpaid bonuses or liabilities under cash-settled share-based payment transactions.

There is no requirement in IAS 24 to disclose individual key management personnel compensation. Instead, entities are required to disclose key management personnel compensation in total and for each of the following categories:

- short-term employee benefits;
- post-employment benefits;
- other long-term benefits;
- termination benefits; and
- share-based payment. *[IAS 24.17]*.

These disclosures must be provided within the notes to the financial statements even when the same (or perhaps even more detailed) information is presented outside the financial statements. This is made clear by the Practice Statement *Making Materiality Judgements*, which emphasizes that publicly available information does not relieve an entity of the obligation to provide material information in its financial statements (paragraph 26 of the Practice Statement).

IAS 24 (see 2.2.9 above) clarifies that where an entity obtains key management personnel services from another entity ('management entity') it is not required to apply the requirements above to the compensation paid or payable by the management entity to the management entity's employees or directors. *[IAS 24.17A]*.

2.6.1 Compensation

'Compensation' includes all employee benefits (as defined in IAS 19 – *Employee Benefits*) including employee benefits to which IFRS 2 – *Share-based Payment* – applies. Employee benefits are all forms of consideration given by an entity, or on behalf of the entity, in exchange for services rendered to the entity. Employee benefits also include such consideration paid on behalf of a parent of the entity in respect of the entity. *[IAS 24.9]*. Therefore, the compensation disclosed by an entity in its financial statements is that which is for services to that entity, irrespective of whether it is paid by the reporting entity or by another entity or individual on behalf of the reporting entity. Further, the disclosures must include outstanding balances and commitments.

Compensation includes:

(a) short-term employee benefits, such as wages, salaries and social security contributions, paid annual leave and paid sick leave, profit-sharing and bonuses (if payable within twelve months of the end of the period) and non-monetary benefits (such as medical care, housing, cars and free or subsidised goods or services) for current employees;

(b) post-employment benefits such as pensions, other retirement benefits, post-employment life insurance and post-employment medical care;

(c) other long-term employee benefits, including long-service leave or sabbatical leave, jubilee or other long-service benefits, long-term disability benefits and, if they are not payable wholly within twelve months after the end of the reporting period, profit-sharing, bonuses and deferred compensation;

(d) termination benefits; and

(e) share-based payment. *[IAS 24.9]*.

IAS 24 is not clear about the basis on which the amount for each of the categories above is determined. It is observed in the Basis for Conclusions that the IASB noted that the guidance on compensation in IAS 19 is sufficient to enable an entity to disclose the relevant information, which suggests that the IASB is expecting the compensation amounts to be based on the expense recognised under the relevant standards (IAS 19 or IFRS 2). *[IAS 24.BC10]*. This is indeed common observed practice. It is helpful to remember that the definition of compensation states that 'employee benefits are all forms of consideration paid, payable or provided by the entity, or on behalf of the entity in exchange for services rendered...' *[IAS 24.9]* and therefore compensation should be disclosed, even when provided by the parent or another group company.

Issues relating to each of the categories are discussed below.

For an illustrative example of the disclosure of key management personnel compensation, see Extract 39.1 at 2.6.9 below.

2.6.2 Short-term employee benefits

As indicated at 2.6.1 above, these include wages, salaries and social security contributions, paid annual leave and paid sick leave, profit-sharing and bonuses (if expected to be settled wholly before twelve months after the end of the reporting period). Most of these should not cause difficulty, since the expense for such items under IAS 19 is generally equivalent to the amount payable for the period. The disclosures would also include outstanding balances and commitments.

Non-monetary benefits (such as medical care, housing, cars and free or subsidised goods or services) must also be included within the amount disclosed for short-term employee benefits. *[IAS 24.9]*. In some cases, these might have been provided at no direct cost to the entity. In such circumstances it would appear reasonable to either attribute a value for non-monetary benefits (for example, the attributable tax benefit), so as to describe them quantitatively, or to describe such benefits qualitatively.

2.6.3 Post-employment benefits

As indicated at 2.6.1 above, these include pensions, other retirement benefits, post-employment life insurance and post-employment medical care. The inclusion of this category confirms that amounts are disclosed while members of key management are providing services. If amounts were only disclosed when the benefits are payable, then in many cases there would be no disclosure since the individuals would no longer be members of key management. The definition of related party transaction includes 'obligations between a reporting entity and a related party'. This implies that post-employment benefit obligations, including commitments, between the reporting entity and the members of the key management during the period covered by the financial statements are disclosed.

For defined contribution plans, it seems appropriate that the amount included is based on the total expense recognised under IAS 19, which is the equivalent of the contributions paid or payable to the plan for service rendered in the period.

The main issue related to defined benefit plans is to determine an appropriate calculation for the disclosable amount for the period. IAS 24 is silent on how the disclosable amount should be determined. Normally, for defined benefit plans, the expense recognised under IAS 19 differs from the contributions payable to the plan. Disclosing the contributions payable usually does not always reflect the benefits provided by the entity in exchange for the services rendered, particularly when the entity is benefitting from a contribution holiday. One approach to determine the disclosable amount would be to include an amount based on the total IAS 19 expense recognised in total comprehensive income. The total amounts recognised under IAS 19 for defined benefit plans includes items such as interest, actuarial remeasurement gains and losses and the effects of curtailments and settlements. This approach requires an apportionment of the total expense to the extent that it relates to the individuals concerned. Another approach would be to determine the disclosable amount based only on the current service cost and, when applicable, past service cost related to those individuals on the grounds that the other items relate more to the overall plan than to the individuals. An entity should adopt a consistent accounting policy for determining the amounts disclosed.

2.6.4 Other long-term benefits

As indicated at 2.6.1 above, these include long-service leave or sabbatical leave, jubilee or other long-service benefits, long-term disability benefits and, if they are not expected to be settled wholly before twelve months after the end of the reporting period, profit sharing, bonuses and deferred compensation. Since the accounting for such items under IAS 19 is on a similar basis to that for post-employment benefits similar issues to those discussed at 2.6.3 above are applicable.

2.6.5 Termination benefits

These should not cause difficulty, since an entity generally recognises such items, particularly for key management personnel, in line with the recognition criteria included in IAS 19.

2.6.6 Share-based payment transactions

This category includes share options, share awards or cash-settled awards granted in return for service by the members of key management. Such compensation is accounted for under IFRS 2. For equity-settled share-based payment transactions, such as share options or share awards, IFRS 2 broadly requires measurement of their fair value at grant date, and that expense is recognised over the period that employees render services. For cash-settled share-based payment transactions, IFRS 2 requires measurement and recognition based on the cash ultimately paid.

IAS 24 does not specify a basis on which the compensation disclosed should be determined. One basis would be to disclose an amount based on the expense under IFRS 2. This basis could lead to negative compensation being disclosed, for example, as a result of the reversal of a cumulative expense relating to share based options whose non-market vesting condition has not been satisfied. In this case, the reporting entity should consider whether additional disclosure is necessary to explain the amount and the change from the prior year. Another basis would be to disclose amounts based on the fair value that the individual received (based on the value of the shares at date of vesting, or at date of exercise of share options or the cash that is ultimately payable) rather than over the period of the service. An entity should adopt a consistent accounting policy for determining the amounts disclosed. In determining an appropriate accounting policy, the entity should also consider consistency with other disclosures related to key management personnel compensation made outside the financial statements.

2.6.7 Reporting entity part of a group

One additional practical difficulty for an entity in a group is that the disclosure of its key management personnel compensation is for the services rendered to the reporting entity. Accordingly, where key management personnel of the reporting entity also provide services to other entities within the group, an apportionment of the compensation is necessary. Likewise, where the reporting entity receives services from key management personnel that are also key management personnel of other entities within the group, the reporting entity may have to impute the compensation received. Such apportionments and allocations required judgement and an assessment of the time commitment involved.

2.6.8 Key management personnel compensated by other entities

A reporting entity also applies the principles set out at 2.6.7 above to situations in which the other entity is a third party, outside of the group, but is a related party.

2.6.9 Illustrative disclosure of key management personnel compensation

An example of the disclosure of key management personnel compensation can be found in the financial statements of BP p.l.c.

Extract 39.1: BP p.l.c. (2019)

Notes on financial statements [extract]

34. **Remuneration of senior management and non-executive directors** [extract]

Remuneration of directors and senior management

			$ million
	2019	2018	2017
Total for all senior management and non-executive directors			
Short-term employee benefits	**30**	25	29
Pensions and other post-retirement benefits	**2**	2	2
Share-based payments	**32**	32	29
Total	**64**	59	60

Senior management comprises members of the executive team, see pages 78-79 for further information.

Short-term employee benefits

These amounts comprise fees and benefits paid to the non-executive chairman and non-executive directors, as well as salary, benefits and cash bonuses for senior management. Deferred annual bonus awards, to be settled in shares, are included in share-based payments. Short-term employee benefits includes compensation for loss of office of $nil in 2019 (2018 $nil and 2017 $nil).

Pensions and other post-retirement benefits

The amounts represent the estimated cost to the group of providing pensions and other post-retirement benefits to senior management in respect of the current year of service measured in accordance with IAS 19 'Employee Benefits'.

Share-based payments

This is the cost to the group of senior management's participation in share-based payment plans, as measured by the fair value of options and shares granted, accounted for in accordance with IFRS 2 'Share-based Payments'.

2.7 Disclosure of other related party transactions, including commitments

IAS 24 requires an entity that has had related party transactions during the periods covered by its financial statements to disclose the nature of the related party relationship as well as information about those transactions and outstanding balances, including commitments, necessary for users to understand the potential effect of the relationship on the financial statements. *[IAS 24.18]*.

2.7.1 Related party transactions requiring disclosure

IAS 24 gives the following as examples of transactions to be disclosed, if they are with a related party. The list is not intended to be exhaustive:

- purchases or sales of goods (finished or unfinished);
- purchases or sales of property and other assets;
- rendering or receiving of services;
- leases;
- transfers of research and development;
- transfers under licence agreements;
- transfers under finance arrangements (including loans and equity contributions in cash or in kind);
- provisions of guarantees or collateral;
- commitments to do something if a particular event occurs or does not occur in the future, including executory contracts (recognised and unrecognised); and
- settlement of liabilities on behalf of the entity or by the entity on behalf of that related party. *[IAS 24.21]*.

IAS 24 does not contain any exemptions based on the nature of the transaction. Consequently, related party transactions include transactions such as dividend payments and the issue of shares under rights issues to major shareholders or key management personnel (i.e. those that fall within the definition of related parties), even where they participate on the same basis as other shareholders. However, for dividend payments, a preparer might conclude that no additional disclosures are necessary beyond those required by IAS 1, to explain the potential effect of the relationship on the financial statements. *[IAS 1.137]*. Further, not all transactions may need to be disclosed. Transactions with significant amounts may be immaterial from an IAS 1 perspective, giving due attention to the qualitative aspects of materiality, discussed at 2.5.1 above.

Related party transactions also include transactions with those individuals identified as related parties where their dealings with the entity are in a private capacity, rather than in a business capacity.

Participation by a parent or subsidiary in a defined benefit plan that shares risks between group entities is a transaction between related parties (see Chapter 35 at 3.3.2). *[IAS 24.22]*.

As indicated at 2.5 above, disclosure is required irrespective of whether or not consideration is received, which means that IAS 24 applies to gifts of assets or services and to asset swaps. Common examples of such transactions which may occur within a group include:

- administration by an entity of another entity within a group (or of its post-employment benefit plan) free of charge;
- transfer of tax assets from one member of a group to another without payment;
- rent-free accommodation or the loan of assets at no charge; or
- guarantees by directors of bank loans to the entity.

2.7.1.A Aggregation of items of a similar nature

Presumably in order to minimise the volume of disclosures, IAS 24 permits aggregation of items of a similar nature, except when separate disclosure is necessary for an understanding of the effects of the related party transactions on the financial statements of the entity. *[IAS 24.24]*. IAS 24 does not expand on this requirement, but it seems appropriate that, for example, purchases or sales of goods with other subsidiaries within a group can be aggregated, but any purchases or sales of property, plant, and equipment or of intangible assets with such entities are shown as a separate category. However, the level of aggregation is limited by the separate disclosure of transactions with particular categories of related parties (see 2.7.2 below).

2.7.1.B Commitments

IFRS provides the following definitions relating to commitments: IFRS 12 states that the commitments relating to joint ventures are those that may give rise to a future outflow of cash or other resources, *[IFRS 12.B18]*, and IFRS 9 defines a firm commitment as 'a binding agreement for the exchange of a specified quantity of resources at a specified price on a specified future date or dates'. *[IFRS 9 Appendix A]*. However, commitments should be considered more widely than these definitions: a typical example of a disclosable commitment might be the agreement to pay certain benefits to an employee on the termination of employment.

IAS 24 specifically mentions executory contracts (recognised and unrecognised) as commitments requiring disclosure. Executory contracts are excluded from the scope of IAS 37 – *Provisions, Contingent Liabilities and Contingent Assets* – unless they are onerous to the reporting entity. An executory contract is a contract under which neither party has performed any of its obligations or both parties have partially performed their obligations to an equal extent. *[IAS 37.3]*. An example of an executory contract would be a contract to buy an asset at a future date where neither the transfer of the asset nor the payment of consideration has occurred.

The words 'commitments to do something if a particular event occurs or does not occur in the future' can potentially have a wide application and is not limited to contractual commitments required to be disclosed by other standards. One obvious type of arrangement to which this applies would be some form of commitment by a subsidiary to its parent to undertake certain trading or research and development activities.

With respect to the type of transaction that the IASB is expecting to be disclosed, IFRS 12 provides a list of illustrative but not exhaustive examples of the type of unrecognised commitments that could relate to joint ventures. Some of these examples could apply equally to other related party arrangements. IFRS 12 clarifies that the commitments required to be disclosed under IAS 24 in respect of joint ventures include an entity's share of commitments made jointly with other investors with joint control of a joint venture. *[IFRS 12.B18]*.

IFRS 12 provides the following illustrations of commitments relating to joint ventures that would typically be disclosable under paragraph 18 of IAS 24 and could apply equally to other related party arrangements:

- unrecognised commitments to contribute funding or resources as a result of, for example:
  - the constitution or acquisition agreements of a joint venture (that, for example, require an entity to contribute funds over a specific period);
  - capital intensive projects undertaken by a joint venture;
  - unconditional purchase obligations, comprising procurement of equipment, inventory or services that an entity is committed to purchasing from, or on behalf of, a joint venture;
  - unrecognised commitments to provide loans or other financial support to a joint venture;
  - unrecognised commitments to contribute resources to a joint venture, such as assets or services; and
  - other non-cancellable unrecognised commitments relating to a joint venture;
- unrecognised commitments to acquire another party's ownership interest (or a portion of that ownership interest) in a joint venture if a particular event occurs or does not occur in the future. *[IFRS 12.B19-20]*.

Provisions of guarantees, which are a form of commitment, require separate disclosure. Disclosure of commitments to purchase property, plant and equipment and intangible assets in aggregate is required separately by IAS 16 – *Property, Plant and Equipment* – and IAS 38 – *Intangible Assets* – respectively. *[IAS 16.74(c), IAS 38.122(e)]*.

2.7.2 Disclosures required for related party transactions, including commitments

The standard states that, at a minimum, the disclosures must include:

(a) the amount of the transactions;

(b) the amount of outstanding balances, including commitments; and:

  (i) their terms and conditions, including whether they are secured, and the nature of the consideration to be provided in settlement; and

  (ii) details of any guarantees given or received;

(c) provisions for doubtful debts related to the amount of outstanding balances; and

(d) the expense recognised during the period in respect of bad or doubtful debts due from related parties. *[IAS 24.18]*.

The standard gives no exemption from disclosure on the grounds of sensitivity or confidentiality. However, since there is no requirement to disclose the name of a related party, this lack of exemption is likely to be less of a concern.

The requirement in (b) above could be read literally as requiring outstanding balances and commitments to be amalgamated into a single balance. However, commitments such as executory contracts do not give rise to outstanding balances. In practice, narrative disclosure of the terms and conditions of material commitments will be necessary.

There is no requirement to disclose individually significant transactions. However, as discussed at 2.9 below, there is such a requirement for transactions with government-related entities where a reporting entity has decided to apply the disclosure exemption.

The disclosures are made separately for each of the following categories:

(a) the parent;

(b) entities with joint control of, or significant influence over, the entity;

(c) subsidiaries;

(d) associates;

(e) joint ventures in which the entity is a joint venturer;

(f) key management personnel of the entity or its parent; and

(g) other related parties. *[IAS 24.19]*.

In our view the references in (a) and (f) above to 'the parent' should be read as including all parents of the entity, i.e. its immediate parent, any intermediate parent, and the ultimate parent. In the context of the financial statements of an entity within a group, it is insufficient to disclose related party transactions for a single category of 'group companies'. Separate categories are required for parent(s), subsidiaries and 'other related parties'.

IAS 24 does not identify the following relationships as a separate category of related party, and therefore we would normally expect to include information related to the following relationships within the category 'other related parties':

- fellow subsidiaries;
- subsidiaries of an investor with significant influence; and
- associates of the entity's controlling investor.

However, a preparer should consider separate disclosure of transactions with the above related parties if this would provide useful information to users of the entity's financial statements.

The classification of amounts payable to, and receivable from, related parties in the different categories is an extension of the disclosure requirement in IAS 1 for an entity to present information either in the statement of financial position or in the notes. *[IAS 1.77]*. The categories are extended to provide a more comprehensive analysis of related party balances and apply to related party transactions. *[IAS 24.20]*.

IAS 24 emphasises that an entity should not state that related party transactions are on an arm's length basis unless the reporting entity can demonstrate such terms and conditions. *[IAS 24.23]*. To substantiate that related party transactions are on an arm's length basis an entity would need to document that a transaction with similar terms and conditions could be obtained from an independent third party.

The company financial statements of Schroders plc provide the following disclosures of related party relationships with subsidiaries.

Extract 39.2: Schroders plc (2019)

Notes to the accounts [extract]

37. Related party transactions

The Company is not deemed to be controlled or jointly controlled by a party directly or through intermediaries under IFRS. As a result, the related parties of the Company comprise principally subsidiaries, joint ventures and associates, key management personnel, close family members of key management personnel and any entity controlled by those parties.

The Company has determined that key management personnel comprises only the Board of Directors.

Transactions between related parties

Details of transactions between the Company and its subsidiaries, which are related parties of the Company, and transactions between the Company and other related parties, excluding compensation (which is set out in note 31), are disclosed below:

	2019					
	Revenue £m	Expenses £m	Interest receivable £m	Interest payable £m	Amounts owed by related parties £m	Amounts owed to related parties £m
Subsidiaries of the Company	418.0	18.5	8.5	0.1	1,496.3	(14.7)
Key management personnel	0.3	–	–	(0.1)	–	(46.3)

	2018					
	Revenue £m	Expenses £m	Interest receivable £m	Interest payable £m	Amounts owed by related parties £m	Amounts owed to related parties £m
Subsidiaries of the Company	447.0	22.4	5.6	0.2	1,427.9	(7.5)
Key management personnel	0.4	–	–	0.1	3.8	(42.5)

Transactions with related parties were made at market rates. The amounts outstanding are unsecured and will be settled in cash.

The consolidated financial statements of J Sainsbury plc provide the following disclosures of related party relationships with joint ventures and associates.

Extract 39.3: J Sainsbury plc (2020)

Notes to the consolidated financial statements [extract]
40 Related party transactions [extract]

b) Joint ventures and associates [extract]

Transactions with joint ventures and associates

For the 52 weeks to 7 March 2020, the Group entered into various transactions with joint ventures and associates as set out below:

	2020 £m	2019 £m
Dividends and distributions received	**141**	18
Repayment of loans from joint venture	**–**	(5)
Disposals of joint ventures	**(21)**	–
Rental expenses paid	**(14)**	(38)

Year-end balances arising from transactions with joint ventures and associates

	2020 £m	2019 £m
Payables		
Other payables	**18**	(5)

The financial statements of British Sky Broadcasting Group plc illustrate the disclosure of transactions with a party controlled by a close family member of key management.

Extract 39.4: British Sky Broadcasting Group plc (2014)

Notes to the consolidated financial statements [extract]
28. Transactions with related parties and major shareholders [extract]

c) Other transactions with related parties [extract]

A close family member of one Director of the Company runs Freud Communications Limited ("Freud"), which has provided external support to the press and publicity activities of the Group. During the year the Group incurred expenditure amounting to £1 million (2013: £1 million) with Freud. At 30 June 2014 there was £1 million (2013: less than £1 million) due to Freud.

The financial statements of BP p.l.c. illustrate the disclosure of commitments to related parties:

Extract 39.5: BP p.l.c. (2019)

Notes on financial statements [extract]

13. Capital commitments

Authorized future capital expenditure for property, plant and equipment (excluding right-of-use assets) by group companies for which contracts had been signed at 31 December 2019 amounted to $11,382 million (2018 $8,319 million, 2017 $11,340 million). BP has contracted capital commitments amounting to $787 million (2018 $1,227 million, 2017 $1,451 million) in relation to associates. BP's share of contracted capital commitments of joint ventures amounted to $1,024 million (2018 $619 million, 2017 $483 million).

17. Investments in associates [extract]

BP has commitments amounting to $11,198 million (2018 $11,303 million), primarily in relation to contracts with its associates for the purchase of transportation capacity.

2.8 Disclosure of expense incurred with management entity

As discussed at 2.2.9 above disclosure of amounts incurred by the entity for the provision of key management personnel services by a separate management entity is required. *[IAS 24.18A]*.

2.9 Disclosures with government-related entities

IAS 24 provides an exemption from the disclosure requirements of paragraph 18, discussed at 2.7.2 above, in relation to related party transactions and outstanding balances, including commitments, with:

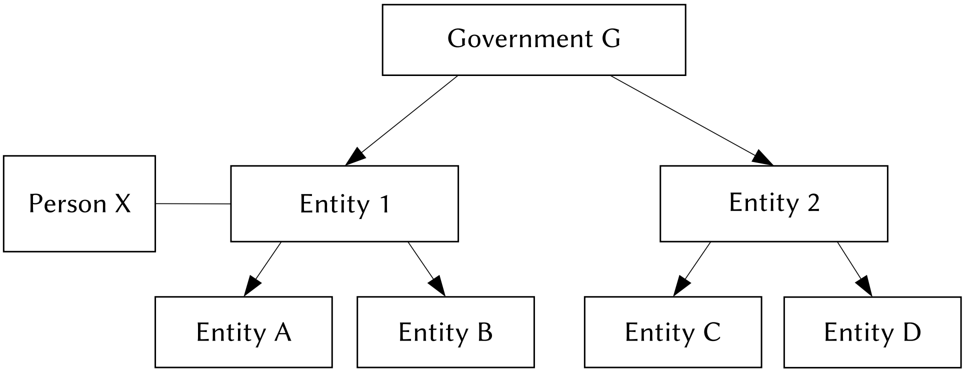
(a) a government that has control or joint control of, or significant influence over, the reporting entity; and

(b) another entity that is a related party because the same government has control or joint control of, or significant influence over, both the reporting entity and the other entity. *[IAS 24.25]*.

From the wording of (a) and (b) above, it would be possible to conclude that a reporting entity which is significantly influenced by a government is related to another entity also significantly influenced by the same government. This is not the case. The definition of a related party in IAS 24 does not include entities that are subject to significant influence from the same entity but are not otherwise related parties as defined in IAS 24 (see 2.2.3 above) and the definition in paragraph 25 cannot add to the definition of a related party.

The application of the disclosure exemption afforded by paragraph 18 is illustrated in the example below, which is based on an illustrative example accompanying IAS 24.

Example 39.10: Application of the disclosure exemption for government-related entities



Government G directly or indirectly controls Entities 1 and 2 and Entities A, B, C and D. Person X is a member of the key management personnel of Entity 1.

For Entity A's financial statements the exemption applies to: (a) transactions with Government G which is the government that ultimately controls Entity A; and (b) transactions with Entities 1, 2, B, C and D which are related entities because they are controlled by the same government as A, i.e.: Government G.

The exemption does not apply to transactions with Person X because Person X is not controlled by Government G.

The use of the disclosure exemption is conditional on the reporting entity making the following disclosures about the transactions and related outstanding balances with the government-related entities:

(a) the name of the government and the nature of its relationship with the reporting entity (i.e. control, joint control or significant influence);

(b) the following information in sufficient detail to enable users of the entity's financial statements to understand the effect of related party transactions on its financial statements:

  (i) the nature and amount of each individually significant transaction; and

  (ii) for other transactions that are collectively, but not individually, significant, a qualitative or quantitative indication of their extent. Types of transactions include those discussed at 2.7.1 above. *[IAS 24.26]*.

The wording above does not explicitly mention 'commitments' when referring to transactions. However, given that IAS 24 describes a commitment as a form of transaction (see 2.7.1 above), disclosure of individually and collectively significant commitments with government-related entities is required.

In using its judgement to determine the level of detail to be disclosed in accordance with the requirements in (b) above, a reporting entity considers the closeness of the related party relationship and other factors, including materiality, relevant in establishing the level of significance of the transaction such as whether it is:

(a) significant in terms of size;

(b) carried out on non-market terms;

(c) outside normal day-to-day business operations, such as the purchase and sale of businesses;

(d) disclosed to regulatory or supervisory authorities;

(e) reported to senior management; and

(f) subject to shareholder approval. *[IAS 24.27].*

Disclosure of the nature and amount of each individually significant transaction is not a requirement for other related party transactions (see 2.7.2 above). The Board considered that this requirement should not be too onerous for a reporting entity because:

(a) individually significant transactions should be a small subset, by number, of total related party transactions;

(b) the reporting entity should know what these transactions are; and

(c) reporting such items on an exceptional basis takes into account cost-benefit considerations. *[IAS 24.BC45].*

The Board also considered that more disclosure of individually significant transactions would better meet the objective of IAS 24 because this approach focuses on transactions that, through their nature or size, are of more interest to users and are more likely to be affected by the related party relationship. *[IAS 24.BC46].* In response to concerns about whether a reporting entity would be able to identify whether the counterparty to such transactions was a government-related entity, the Board concluded that 'management will know, or will apply more effort in establishing, who the counterparty to an individually significant transaction is and will have, or be able to obtain, background information on the counterparty'. *[IAS 24.BC47-48].*

Extract 39.6 below from the financial statements of The Royal Bank of Scotland Group plc illustrates disclosure summarising the types of transactions with government-controlled entities that are related parties and details of an individually material transaction.

Extract 39.6: The Royal Bank of Scotland Group plc (2019)

Notes on the consolidated accounts [extract]

32 **Related parties** [extract]

UK Government

On 1 December 2008, the UK Government through HM Treasury became the ultimate controlling party of The Royal Bank of Scotland Group plc. The UK Government's shareholding is managed by UK Government Investments Limited, a company wholly owned by the UK Government. As a result, the UK Government and UK Government controlled bodies became related parties of RBS Group.

In 2015, HM Treasury sold 630 million of RBSG plc's ordinary shares and a further 925 million in June 2018. At 31 December 2019, HM Treasury's holding in the company's ordinary shares was 62.1%.

RBS Group enters into transactions with many of these bodies on an arm's length basis. Transactions include the payment of: taxes – principally UK corporation tax (Note 7) and value added tax; national insurance contributions; local authority rates; and regulatory fees and levies (including the bank levy (Note 3) and FSCS levies (Note 26) together with banking transactions such as loans and deposits undertaken in the normal course of banker-customer relationships.

The following are other illustrations of the type of disclosures required for transactions with government-related entities based on examples in the standard:

Example 39.11: Individually significant transaction carried out on non-market terms

On 15 January 2021 the company sold a 10-hectare piece of land to an entity controlled by Government G for €5,000,000. On 31 December 2021 a plot of land in a similar location, of similar size and with similar characteristics, was sold for €3,000,000. There had not been any appreciation or depreciation of the land in the intervening period. See Note X for disclosure of government assistance as required by IAS 20.

Example 39.12: Individually significant transaction because of size of transaction

In the year ended 31 December 2021 Government G provided the company with a loan equivalent to 50% of its funding requirement, repayable in quarterly instalments over the next five years. Interest is charged on the loan at a rate of 5%, which is comparable to that charged on the company's external bank loans.

Example 39.13: Collectively significant transactions

The company's significant transactions with Government G and other entities controlled, jointly controlled or significantly influenced by Government G are a large portion of its sales of goods and purchases of raw materials [alternatively – about 50% of its sales of goods and services and about 35% of its purchases of raw materials].

The company also benefits from guarantees by Government G of the company's bank borrowing. See Note X of the financial statements for disclosure of government assistance as required by IAS 20.

In Example 39.13 above, either a qualitative or a quantitative disclosure is permitted for transactions that are collectively but not individually significant.

Chapter 40 Statement of cash flows

1 INTRODUCTION

1.1 Background

IAS 7 – *Statement of Cash Flows* – is one of the older standards in IFRS, having been issued in 1992.

The standard specifies how entities report information about the historical changes in cash and cash equivalents and applies to all entities regardless of their business activities, including financial institutions. Modifications to IAS 7 since it was originally published have been limited resulting in a standard that is much shorter and more succinct than many new and revised standards. It was last updated in 2016 to require entities to provide disclosures about changes in liabilities arising from financing activities.

IAS 7 requires that inflows and outflows of cash and cash equivalents are classified and reported under three different headings being:

- operating activities;
- investing activities; and
- financing activities. *[IAS 7.10]*.

The resulting information in the statement of cash flows should provide insight into an entity's ability to generate cash to fund operations, reinvest to maintain or expand operating capacity, repay debt and distribute dividends, and how it manages cash.

The definitions of operating, investing and financing activities in the standard, which are covered at 1.5 below, provide guidance on how to distinguish the cash flows by activity.

1.2 The statement of cash flows as a primary financial statement

The statement of cash flows is a primary financial statement and should be presented with equal prominence to the income statement, the statement of financial position and the statement of changes in equity. *[IAS 1.11]*. Arguably, it provides some of the most important information in the financial statements, as all entities need cash to run their day-to-day operations, pay their obligations and provide returns to investors, regardless of their particular line of business or geographical location.

This information, when combined with information in the rest of the financial statements, is useful in assessing factors that may affect the entity's liquidity, financial flexibility, profitability, and risk.

The importance of information on cash flows in the reporting period as a means to help users understand a reporting entity's operations, evaluate its financing and investing activities, assess its liquidity or solvency and interpret other information about financial performance is highlighted by the *Conceptual Framework for Financial Reporting* *[CF 1.20]* and was rightfully emphasized by the IFRS Interpretations Committee in its July 2014 agenda decision regarding the presentation and content of the condensed statement of cash flows in the interim financial statements according to IAS 34 – *Interim Financial Reporting*. It also helps users to assess management's stewardship of the entity's economic resources. The Framework guidance is further discussed in Chapter 2 at 4.2.2.

1.3 Transparency and consistency of cash flow presentation

In recent years, the statement of cash flows has become an area of scrutiny for investors as well as regulators from a number of different jurisdictions, with both misclassification errors and insufficient disclosures highlighted as areas of concern.

This is partly because the use of cashflows as a key performance metric in the entities' communication to the financial markets has become increasingly common along with, and sometimes even in replacement of, some other KPIs more focused on the generation of income.

Yet, this is also because the definitions of operating, investing and financing activities in IAS 7 are broad and only illustrated by lists of examples which are not exhaustive. Whilst it is tempting to think that cash flows should be a simple statement of fact and there is less need for judgement around recognition and measurement of cash flows compared to other areas of the financial statements, the lack of clarity in the standard as to how some cash flows from common transactions should be categorised has resulted in diversity amongst preparers. Some common areas where judgement may be required to classify investments in cash and flows are discussed at 3 and 4 below in reference to the definition of cash and cash equivalents and classification judgements.

In addition, the interaction of IAS 7 with new standards such as IFRS 9 – *Financial Instruments*, IFRS 15 – *Revenue from Contracts with Customers* – and IFRS 16 – *Leases* – has led to further difficulties in applying the standard.

The IFRS Interpretations Committee has received numerous requests for clarification on the requirements of the standard. However, clarifications have never been finalised, leaving preparers and users faced with ambiguity and inconsistency in the application of a standard in need of improvements.

Because the preparation of a cash flow statement is not merely a mechanical exercise, investors and regulators have focused on the adequacy of disclosures explaining how the requirements of IAS 7 have been applied. In our view, where the appropriate classification of cash flows in the cash flow statement is not clear from IAS 7 and an entity has therefore applied judgement to determine the appropriate presentation of material items based on the principals of IAS 7, these judgements should be clearly disclosed. This is further discussed at 5.7 below.

1.4 Future developments

Looking to the future, the IASB has proposed limited changes to the requirements of IAS 7 in the Exposure Draft 2019/7 – *General Presentation and Disclosures*, which was issued in December 2019. This is further discussed at 4.4.15 below. However, these proposed changes do not address many of the classification issues that are discussed in this chapter.

The Interpretations Committee has recently considered one specific area of judgement being the presentation and disclosure, including the presentation in the statement of cash flow, of the use of supply chain financing. Stakeholders have raised concerns about the transparency of these arrangements and the lack of consistency of treatment, particularly considering the attention that undisclosed supply chain financing arrangement have attracted in recent high-profile corporate failings. In June 2020 the committee published a tentative agenda decision outlining how IFRS, including IAS 7, should be applied to the different aspects of accounting for these arrangements.[1] The nature of supply chain financing and the committee's discussions are addressed at 4.4.5 below.

1.5 Terms used in IAS 7

The following terms are used in IAS 7 with the meanings specified: *[IAS 7.6]*

Cash comprises cash on hand and demand deposits.

Cash equivalents are short-term, highly liquid investments that are readily convertible to known amounts of cash and which are subject to an insignificant risk of changes in value.

Cash flows are inflows and outflows of cash and cash equivalents.

Operating activities are the principal revenue-producing activities of the entity and other activities that are not investing or financing activities.

Investing activities are the acquisition and disposal of long-term assets and other investments not included in cash equivalents.

Financing activities are activities that result in changes in the size and composition of the contributed equity and borrowings of the entity.

2 OBJECTIVE AND SCOPE OF IAS 7

2.1 Objective

The objective of IAS 7 is to require entities to provide information about changes in cash and cash equivalents in the reporting period in a statement which classifies cash flows from operating, investing and financing activities. The standard aims to give users of financial statements a basis to evaluate the entity's ability to generate cash and cash equivalents and its needs to utilise those cash flows. *[IAS 7 Objective]*.

A statement of cash flows, when used in conjunction with the rest of the financial statements, provides information that enables users to evaluate the changes in net assets of an entity, its financial structure (including its liquidity and solvency) and its ability to affect the amounts and timing of cash flows to adapt to changing circumstances and opportunities. *[IAS 7.4]*. The historical cash flow information is often used as an indicator of the amount, timing and certainty of future cash flows. It is also useful in examining the relationship between profitability and net cash flow and the impact of changing prices. *[IAS 7.5]*.

2.2 Scope

IAS 7 applies to all entities, regardless of size, operations, ownership structure or industry, and therefore includes wholly owned subsidiaries and banks, insurance entities and other financial institutions. There are no exemptions from the standard. The standard argues that users of an entity's financial statements are interested in how the entity generates and uses cash and cash equivalents regardless of the nature of the entity's activities and irrespective of whether cash can be viewed as the product of the entity, as may be the case with a financial institution. All entities need cash to conduct their operations, to pay their obligations, and to provide returns to their investors. Accordingly, all entities are required to present a statement of cash flows. *[IAS 7.3]*. A statement of cash flows is required to make up a complete set of any financial statements in accordance with IFRS. *[IAS 1.10]*. Therefore, the parent entity's cash flow statement should be presented even if the separate financial statements are presented together with consolidated financial statements which include a consolidated statement of cash flows.

3 CASH AND CASH EQUIVALENTS

Since the objective of a statement of cash flows is to provide an analysis of changes in cash and cash equivalents, the definitions of cash and of cash equivalents at 1.5 above are essential to its presentation. It is also important to understand the reporting entity's cash management policies, especially when considering whether balances that are not obviously cash on hand and demand deposits should be classified as cash equivalents, as the standard states that cash equivalents are held to meet short-term cash commitments rather than for investment or other purposes. *[IAS 7.7]*. Cash management includes the investment of cash in excess of immediate needs into cash equivalents, *[IAS 7.9]*, such as short-term investments. For investments to qualify as a cash equivalent, they must be:

- short term;
- highly liquid;
- readily convertible into known amounts of cash; and
- subject to insignificant risk of changes in value. *[IAS 7.6]*.

However, the purpose for which the investments are held must also be considered and this is a matter of facts and circumstances. Where investments meet the four criteria above but are not held by the entity to meet short term cash commitments, they should not be classified as cash equivalents.

A statement of cash flows under IAS 7 excludes movements between cash on hand and cash equivalents because these are components of an entity's cash management, rather than part of its operating, investing and financing activities. *[IAS 7.9]*. However, as shown below, the definition of cash equivalents can cause some difficulty in practice.

3.1 Components of cash equivalents and explanation of cash management policies

Regardless of an entity's cash management policies and practices, an investment can only be classified within cash equivalents if it is held by the entity to meet short term cash commitments and all other criteria in the definition are also satisfied (see 3.2 below).

In view of the variety of cash management practices and banking arrangements around the world, entities are required to disclose the composition of cash and cash equivalents *[IAS 7.45]* and explain their cash management policies. *[IAS 7.46]*.

For example, this is how VTech Holdings and Lufthansa satisfy these requirements:

Extract 40.1: VTech Holdings Limited (2020)

Notes to the Financial Statements [extract]

Principal Accounting Policies [extract]

R Cash and Cash Equivalents

Cash and cash equivalents comprise cash at bank and on hand, demand deposits with banks and other financial institutions, short-term highly liquid investments that are readily convertible into known amounts of cash and which are subject to an insignificant risk of changes in value, having been within three months of maturity at acquisition. Bank overdrafts that are repayable on demand and form an integral part of the Group's cash management are also included as a component of cash and cash equivalents for the purpose of the statement of cash flows. Cash and cash equivalents are assessed for ECLs in accordance with the policy set out in note (N)(i).

Extract 40.2: Deutsche Lufthansa AG (2019)

CONSOLIDATED FINANCIAL STATEMENTS [extract]

Notes to the consolidated financial statements [extract]

NOTES TO THE CONSOLIDATED CASH FLOW STATEMENT [extract]

42 Notes to cash flow from operating, investing and financing activities [extract]

The cash flow statement shows how cash and cash equivalents have changed over the reporting period at the Lufthansa Group. In accordance with IAS 7, cash flows are divided into cash inflows and outflows from operating activities, from investing activities and from financing activities. The cash and cash equivalents shown in the cash flow statement comprise the statement of financial position items bank balances and cash-in-hand, without fixed-term deposits with terms of three to twelve months, amounting to EUR 0m (previous year: EUR 66m). The amount of liquidity in the broader sense is reached by adding securities that can be liquidated at short notice.

If an entity changes the purpose for which it holds certain investments, for example a deposit which was previously held for short term cash management is now held to generate an investment return, this would be considered a change in facts and circumstances, which would be accounted for prospectively. In these circumstances, the reclassification out of cash and cash equivalents would appear as a reconciling item in the cash flow statement.

3.2 Components of cash and cash equivalents

3.2.1 Demand deposits and short-term investments

In defining 'cash', IAS 7 does not explain what is meant by 'demand deposits', perhaps because the term is commonly understood as amounts that can be withdrawn on demand, without prior notice being required or a penalty being charged (for example, by an additional fee or forfeiture of interest). In any event, the distinction is largely irrelevant because amounts not classified as demand deposits may still qualify as cash equivalents and end up being treated in the same way. Thus, whether an amount meets the definition of a cash equivalent may become the more important determination.

Cash equivalents are held for the purpose of meeting short-term cash commitments rather than for investment or other purposes. For an investment to qualify as a cash equivalent it must be readily convertible to a known amount of cash and be subject to an insignificant risk of changes in value. Normally only an investment with a short maturity of, say, three months or less from the date of acquisition qualifies as a cash equivalent. Equity investments are excluded unless they are cash equivalents in substance. IAS 7 provides an example of such an instrument, being redeemable preference shares acquired within a short period of their maturity and with a specified redemption date. *[IAS 7.7]*. The Interpretations Committee considered, in July 2009,[2] what the standard means when it refers to a 'known amount of cash' and confirmed that the amount of cash that will be received must be known at the time of the initial investment. Accordingly, traded commodities, such as gold bullion, would not be eligible for inclusion in cash equivalents because the proceeds to be realised from such an investment is determined at the date of disposal rather than being known or determinable when the investment is made.

Cash held in a foreign currency or investments acquired in a currency other than the functional currency of the entity ('foreign currency') are not excluded from qualifying as cash and cash equivalents merely because they are denominated in a foreign currency, provided they meet the other criteria discussed above. *[IAS 7.28]*.

3.2.2 Money market funds

Entities commonly invest in money market-type funds such as an open-ended mutual fund that invests in money market instruments like certificates of deposit, commercial paper, treasury bills, bankers' acceptances and repurchase agreements. Although there are different types of money market funds, they generally aim to provide investors with low-risk, low-return investment while preserving the value of the assets and maintaining a high level of liquidity. The question then arises as to whether investments in such funds can be classified as cash equivalents. As discussed below, entities may consider the underlying investments of the fund when assessing the significance of the risk of changes in value, however when determining whether classification as a cash equivalent is appropriate, the unit of account is the investment in the money market fund itself.

To meet the definition of a cash equivalent, an investment must be: short term; highly liquid; readily convertible to a known amount of cash; and subject to insignificant risk of changes in value. IAS 7 considers a maturity date of three months or less from the date of acquisition to be short-term in the context of maturity, however money market funds generally do not have a legal maturity date. Instead, if the investments are puttable and can be sold back to the fund at any time, they may meet the short-term criterion.

Typically, investments in money market funds are redeemed directly with the fund, therefore in assessing liquidity of the investment, focus should be on the liquidity of the fund itself. In making this assessment, entities should consider the nature of any redemption restrictions in place as these may prevent the redemption of the investment in the short term. Alternatively, if a money market fund investment is quoted in an active market, it might be regarded as highly liquid on that basis.

The short-term and highly liquid investment must also be readily convertible into known amounts of cash which are subject to an insignificant risk of changes in value. *[IAS 7.6]*. As discussed at 3.2.1 above this means that the amount of cash that will be received must be known at the time of the initial investment. Accordingly, investments in shares or units of money market funds cannot be considered as cash equivalents simply because they are convertible at any time at the then market price in an active market.

The Interpretations Committee also confirmed that an entity would have to satisfy itself that any investment was subject to an insignificant risk of change in value for it to be classified as a cash equivalent.[3] In assessing whether the change in value of an investment in a money market fund can be regarded as insignificant, an entity must conclude that the range of possible returns is very small. This evaluation is first made at the time of acquiring the investment and reassessment is required if the facts and circumstances change. The evaluation will involve consideration of factors such as: the maturity of the underlying investments of the fund; the credit rating of the fund; the nature of the investments held by the fund (i.e. not subject to volatility); the extent of diversification in the portfolio (which is expected to be very high); the investment policy of the fund; and any mechanisms by the fund to guarantee returns (for example by reference to short-term money market interest rates).

Investments are often held for purposes other than to act as a ready store of value that can be quickly converted into cash when needed to meet short-term cash commitments. It is therefore important, even where the criteria above are met, to understand why the entity has invested in a particular money market fund. Where an investment otherwise satisfies the criteria in paragraph 6 of IAS 7, but is not held by the entity to satisfy short-term cash commitments, it should not be classified as a cash equivalent.

Substantial judgement may be required in assessing whether an investment in money market funds can be classified as a cash equivalent. Therefore, appropriate disclosure is essential. As discussed at 3.1 above, entities are required to disclose the composition of cash equivalents and, where relevant, this should include significant judgements made in classifying investments in money market funds.

3.2.3 Investments with maturities greater than three months

The longer the term of the investment, the greater the risk that a change in market conditions (such as interest rates) can significantly affect its value. For this reason, IAS 7 excludes most equity investments from cash equivalents and restricts the inclusion of other investments to those with a short maturity of, say, three months or less from the date of their acquisition by the entity. *[IAS 7.7]*.

Similarly, an investment with a term on acquisition of, say, nine months is not reclassified as a cash equivalent from the date on which there is less than three months remaining to its maturity. If such reclassifications were permitted, the statement of cash flows would have to reflect movements between investments and cash equivalents. This would be misleading because no actual cash flows would have occurred.

The criteria explained above are guidelines, not rules, and a degree of common sense should be used in their application. In the final analysis, cash equivalents are held to meet short-term cash commitments and amounts should be included in cash equivalents only if they can be regarded as being nearly as accessible as cash and essentially as free from exposure to changes in value as cash.

For example, an entity might justify including in cash equivalents a fixed deposit with an original term longer than three months if it effectively functions like a demand deposit. Typically, a fixed deposit will carry a penalty charge for withdrawal prior to maturity. A penalty will usually indicate that the investment is held for investment purposes rather than the purpose of meeting short-term cash needs. However, some fixed deposits still offer interest at a prevailing demand deposit rate in the event of early withdrawal, with any penalty limited to the entity being required to forego the incremental higher interest that it would have received if the deposit were held to maturity. In this case, it may be arguable that there is effectively no significant penalty for early withdrawal, as the entity receives at least the same return that it otherwise would have in a demand deposit arrangement. Where an entity does assert that this type of investment is held for meeting short-term cash needs and classifies the investment as a cash equivalent, the calculation of the effective interest rate (EIR) in accordance with IFRS 9 should be on a consistent basis. IFRS 9 requires that, when calculating the EIR, all contractual terms of the financial instrument, for example prepayments, call and similar options, should be considered. See Chapter 50 at 3.4. *[IFRS 9 Appendix A]*. In this example, the entity is asserting that it is likely to withdraw the deposit should the need arise and, as a consequence, will only receive interest at the (lower) demand deposit rate. Therefore, the EIR should reflect this intention.

3.2.4 Bank overdrafts

Although bank borrowings are generally considered to be financing activities, there are circumstances in which bank overdrafts repayable on demand are included as a component of cash and cash equivalents. This is in cases where the use of short-term overdrafts forms an integral part of an entity's cash management practices. Evidence supporting such an assertion would be that the bank balance often fluctuates from being positive to overdrawn. *[IAS 7.8]*.

The Interpretations Committee confirmed that where overdrafts do not often fluctuate from being negative to positive, this is an indicator that the arrangement does not form part of an entity's cash management and, instead, represents a form of financing.[4]

3.2.5 Cryptocurrencies

The Interpretations Committee confirmed in its June 2019 meeting that a holding of cryptocurrency is not cash because cryptocurrencies do not currently have the characteristics of cash.[5] In particular, the Committee noted that, although some cryptocurrencies can be used in exchange for particular goods or services, the Committee is not aware of any cryptocurrency that is used as a medium of exchange or as the monetary unit in pricing goods or services to such an extent that it would be the basis on which all transactions are measured and recognised in financial statements.[6]

Cryptocurrencies are discussed in more detail in Chapter 17 at 11.5.

3.2.6 Client money

Some financial institutions and other entities hold money on behalf of clients. The terms on which such money is held can vary widely. This is discussed in more detail in Chapter 52 at 3.7.

There are numerous types of arrangements that result in an entity holding client money, so it is impossible to generalise as to the appropriate treatment. However, as explained in Chapter 52 at 3.7, where an entity enjoys sufficient use of the client money such that it is exposed to the credit risk associated with the cash and is entitled to all income accruing, the entity would include the client money as part of its cash balance and recognise a corresponding liability. Any restrictions on the use of the cash should be considered and disclosed as explained in 3.4 below.

3.3 Reconciliation with items in the statement of financial position

The amount shown alongside the caption in the statement of financial position for 'cash and cash equivalents' will not always be a reliable guide for IAS 7 purposes. Many entities present the components of cash and cash equivalents separately on the face of the statement of financial position, such as 'cash and bank balances' and 'short-term bank deposits'. Additionally, some entities may include bank overdrafts in cash and cash equivalents for cash flow purposes, but, if no legal right of set-off exists, will present bank overdrafts separate from cash in the statement of financial position as financial liabilities. *[IAS 32.42]*.

The standard requires an entity to disclose the components of cash and cash equivalents and to present a reconciliation to the statement of financial position, *[IAS 7.45]*, which means that any difference between 'cash and cash equivalents' for IAS 7 purposes and presentation in the statement of financial position will be evident in the notes to the financial statements.

Schiphol Group provides a reconciliation of the components of cash and cash equivalents, which includes cash held for sale.

Extract 40.3: Royal Schiphol Group N.V. (2017)

Consolidated statement of cash flow for 2017 [extract]
(in thousands of euros)

	2017	2016
Cash from continuing operations	170,370	238,691
Cash held for sale	–	12,076
	170,370	250,767

3.4 Restrictions on the use of cash and cash equivalents

The amount of significant cash and cash equivalent balances that is not available for use by the group should be disclosed, together with a commentary by management to explain the circumstances of the restriction. *[IAS 7.48]*. Examples include cash and cash equivalents held by a subsidiary operating under exchange controls or other legal restrictions that prevent their general use by the parent or other subsidiaries. *[IAS 7.49]*.

The nature of the restriction must also be assessed to determine if the balance is ineligible for inclusion in cash equivalents because the restriction results in the investment ceasing to be highly liquid or readily convertible. For example, where an entity covenants to maintain a minimum level of cash or deposits as security for certain short-term obligations, and provided that no amounts are required to be designated for that specific purpose, such balances could still be regarded as cash equivalents, albeit subject to restrictions, as part of a policy of managing resources to meet short-term commitments.

However, an entity may be required formally to set aside cash, for example as a result of a regulated minimum cash balance or by way of a deposit into an escrow account, as part of a specific project or transaction, such as the acquisition or construction of a property or as conditions of a bond issue. In such circumstances, it is necessary to consider the terms and conditions relating to the account and the conditions relating to both the entity's and the counterparty's access to the funds within it to determine whether it is appropriate for the deposit to be classified in cash equivalents.

In Extract 40.4 below, Lloyds Banking Group has various restricted cash balances. The Bank is required to exclude from cash and cash equivalents the mandatory reserve deposits held with local central banks because these amounts are not available to finance the entity's day-to-day operations. Conversely, certain balances held by its life fund subsidiaries do still meet the definition of cash and cash equivalents, and the Group is only required to disclose the restrictions thereon.

Extract 40.4: Lloyds Banking Group plc (2019)

Notes to the consolidated financial statements [extract]

Note 54: **Consolidated cash flow statement** [extract]

(D) **Analysis of cash and cash equivalents as shown in the balance sheet**

	2019	**2018**	**2017**
	£m	**£m**	**£m**
Cash and balances at central banks	**55,130**	54,663	58,521
Less: mandatory reserve deposits[1]	**(3,289)**	(2,553)	(957)
	51,841	52,110	57,564
Loans and advances to banks	**9,775**	6,283	6,611
Less: amounts with a maturity of three months or more	**(3,805)**	(3,169)	(3,193)
	5,970	3,114	3,418
Total cash and cash equivalents	**57,811**	55,224	60,982

[1] Mandatory reserve deposits are held with local central banks in accordance with statutory requirements; these deposits are not available to finance the Group's day-to-day operations.

Included within cash and cash equivalents at 31 December 2019 is £49 million (31 December 2018: £40 million; 1 January 2018 £48 million; 31 December 2017: £2,322 million) held within the Group's long-term insurance and investments businesses, which is not immediately available for use in the business.

Similarly, in the following extract, InterContinental Hotels Group has a number of restricted cash balances which it includes within 'Other financial assets' on the statement of financial position, rather than in cash and cash equivalents.

Extract 40.5: InterContinental Hotels Group PLC (2019)

Notes to the Group Financial Statements [extract]

17. Other financial assets [extract]

Restricted funds

The shortfall reserve deposit is held for the specific purpose of funding shortfalls in owner returns relating to the Barclay associate. No amounts required release from the deposit during the current or prior year. Any shortfalls funded are subject to potential clawback in future years. The maximum length of time for which the restricted funds will be held is the life of the hotel management agreement.

Amounts ring-fenced to satisfy insurance claims are principally held in the Group's Captive, which is a regulated entity. Further disclosures are included in note 21.

The bank accounts pledged as security (£31m) are subject to a charge in favour of the members of the UK unfunded pension arrangement (see note 27). The amounts pledged as security may change in future years subject to the trustees' agreement and updated actuarial valuations. The bank accounts will continue to be pledged as security until the date at which the UK unfunded pension liabilities have been fully discharged, unless otherwise agreed with the trustees.

In the exposure draft ED/2014/6 – *Disclosure Initiative – Proposed amendments to IAS 7*, issued in December 2014, the IASB noted that additional restrictions, such as financial disincentives to utilising certain cash balances, or other considerations may be relevant to understanding the liquidity of the entity, as they affect the decision to utilise cash and cash equivalents. The example is given of tax liabilities that would arise on the repatriation of foreign cash and cash equivalent balances. The exposure draft proposed that where such matters exist, they should be disclosed. However, the IASB decided not to take these proposals forward and instead use the work done to date to inform the post implementation review of IFRS 12 – *Disclosure of Interests in Other Entities*.[7] Nevertheless, entities might want to consider making additional disclosures where such restrictions or disincentives exist.

4 CLASSIFICATION IN THE STATEMENT OF CASH FLOWS

The statement of cash flows reports inflows and outflows of cash and cash equivalents during the period classified under:

- operating activities;
- investing activities; and
- financing activities. *[IAS 7.10]*.

This classification is intended to allow users to assess the impact of these three types of activity on the financial position of the entity and the amount of its cash and cash equivalents. Whilst not stated explicitly in the standard, the presentation of operating, investing and financing cash flows usually follows this sequence in practice, and a total net cash flow for each standard heading should be shown. Comparative figures are required for all items in the statement of cash flows and the related notes. *[IAS 1.38]*.

The components of cash flows are classified as operating, investing or financing activities in a manner which is most appropriate to the business of the entity. *[IAS 7.11]*. For example, the purchase of investments is likely to be classified as an operating cash flow for a financial institution, but as an investing cash flow for a manufacturer. Additionally, a single transaction may comprise elements of differently classified cash flows. For example, when repayments on a loan include both interest and capital, the element reflecting the interest expense may be included in either operating activities or financing activities (see 4.4.1 below) whereas the capital repayment must be classified as a financing cash flow. *[IAS 7.12]*.

The format of the statement of cash flows is illustrated in Extract 40.6. As permitted by the standard, AstraZeneca has included interest paid under operating activities, interest received under investing activities and dividends paid under financing activities.

Extract 40.6: AstraZeneca PLC (2019)

Exchange rate effects		**5**	(38)	(66)
Cash and cash equivalents at the end of the period	17	**5,223**	4,671	3,172

Having reviewed a variety of requests received from constituents for further guidance on the classification of cash flows, the Interpretations Committee and the IASB have reiterated the general requirement set out in paragraph 11 of IAS 7 that the primary principle for classification of cash flows should be in accordance with the nature of the activity in a manner that is most appropriate to the business of the entity.[8]

4.1 Cash flows from operating activities

Operating activities are defined as 'the principal revenue-producing activities of the entity and other activities that are not investing or financing activities'. *[IAS 7.6]*. The standard states that the value of information on operating cash flows is twofold. It provides a key indicator of the extent to which the entity has generated sufficient cash flows from its operations to repay debt, pay dividends and make investments to maintain and increase its operating capability, without recourse to external sources of financing. Also, information about the components of historical operating cash flows may assist in the process of forecasting future operating cash flows, when used in conjunction with other financial statement information. *[IAS 7.13]*.

Cash flows from operating activities generally result from transactions and other events that enter into the determination of profit or loss. Examples include: *[IAS 7.14]*

(a) cash receipts from the sale of goods and the rendering of services;

(b) cash receipts from royalties, fees, commissions and other revenue;

(c) cash payments to suppliers for goods and services;

(d) cash payments to and on behalf of employees;

(e) cash receipts and cash payments of an insurance entity for premiums and claims, annuities and other policy benefits;

(f) cash payments or refunds of income taxes unless they can be specifically identified with financing and investing activities; and

(g) cash receipts and payments from contracts held for dealing or trading purposes (see 4.4.12 below regarding the allocation of cash flows on derivative contracts).

Operating activities is also a 'default category' for any cash flows that do not meet the criteria of investing or financing cash flows. For example, as discussed at 6.3.1 below, acquisition-related costs in a business combination that must be recognised as an expense, *[IFRS 3.53]*, would also be classified as operating cash flows because there is no related asset that would justify classification as an investing cash flow. *[IAS 7.16]*.

When an entity holds securities and loans for dealing or trading purposes, they are similar to inventory acquired specifically for resale. Therefore, any related cash flows are classified as operating activities. Similarly, cash advances and loans made by financial institutions are usually classified as operating activities, since they relate to the main revenue-generating activity of that entity (see 7.1 below). *[IAS 7.15]*. IFRS 17 – *Insurance Contracts*, which is effective for periods beginning on or after 1 January 2023 (see Chapter 56 at 17.1), deletes the example in (e) above from IAS 7.

The proceeds from the sale of property, plant and equipment, which are usually included in cash flows from investing activities, are an example of an item that enters into the determination of profit or loss that is not usually an operating cash flow. *[IAS 7.14]*. However, the proceeds from sales of assets previously held for rental purposes are classified as cash flows from operating activities if the entity routinely sells such assets in its ordinary course of business. Similarly, cash payments to manufacture or acquire property, plant and equipment held for rental to others, and that are routinely sold in the ordinary course of business after rental, are also classified as cash flows from operating activities (see 4.4.7 below). *[IAS 7.14]*.

Cash flows from operating activities may be reported on a gross or net basis, also known as the direct and indirect methods. *[IAS 7.18]*. The use of the direct or indirect method is an accounting policy choice and should be applied consistently from period to period. Any change in method should be reported under IAS 8 – *Accounting Policies, Changes in Accounting Estimates and Errors*. This would require comparatives to be restated and additional disclosures given, including the reasons for the change in policy. *[IAS 8.29]*.

4.1.1 The direct method

Under the direct method, major classes of gross cash receipts and gross cash payments are disclosed. *[IAS 7.18]*. IAS 7 encourages entities to use the direct method, because it provides information which may be useful in estimating future cash flows and which is not available under the indirect method. *[IAS 7.19]*.

Under the direct method, information about major classes of gross cash receipts and payments may be obtained either:

(a) from the accounting records of the entity (essentially based on an analysis of the cash book); or

(b) by adjusting sales, cost of sales (interest and similar income and interest expenses and similar charges for a financial institution) and other items in the statement of comprehensive income for:

    (i) changes during the period in inventories and operating receivables and payables;

    (ii) other non-cash items; and

    (iii) other items for which the cash effects are investing or financing cash flows. *[IAS 7.19]*.

A statement of cash flows prepared under the direct method should include the same disclosures of gross cash receipts and gross cash payments irrespective of which approach has been used to determine their value. There is no requirement for entities using the approach described in (b) above to present a reconciliation showing the adjustments made between, for example, revenue in the statement of comprehensive income and cash receipts from customers.

African Rainbow Minerals Limited is an example of an entity using the direct method for presenting its cash flows from operating activities, as illustrated in Extract 40.7 below.

Extract 40.7: African Rainbow Minerals Limited (2019)

STATEMENTS OF CASH FLOWS [extract]

4.1.2 The indirect method

The indirect method arrives at the same value for net cash flows from operating activities but does so by working back from amounts reported in the statement of comprehensive income. There are two approaches for presenting the net cash flows from operating activities when using the indirect method. The most common approach adjusts reported profit or loss for the effects of:

(a) changes in inventories and operating receivables and payables during the period;

(b) non-cash items such as depreciation, provisions, deferred taxes, unrealised foreign currency gains and losses, and undistributed profits of associates; and

(c) all other items for which the cash effects are investing or financing cash flows. *[IAS 7.20]*.

Anheuser-Busch InBev has used this adjusted profit approach to present its indirect method statement of cash flows, as illustrated in Extract 40.8 below.

Extract 40.8: Anheuser-Busch InBev NV/SA (2019)

Consolidated statement of cash flows [extract]

For the year ended 31 December

Million US dollar	**Notes**	**2019**	**2018 restated**
OPERATING ACTIVITIES			
Profit from continuing operations		**9 990**	**5 157**
Depreciation, amortization and impairment	10	4 657	4 624
Impairment losses on receivables, inventories and other assets		112	107
Additions/(reversals) in provisions and employee benefits		216	504
Net finance cost/(income)	11	3 473	8 826
Loss/(gain) on sale of property, plant and equipment and intangible assets		(149)	(82)
Loss/(gain) on sale of subsidiaries, associates and assets held for sale		(34)	(20)
Equity-settled share-based payment expense	26	340	333
Income tax expense	12	2 786	2 585
Other non-cash items included in profit		(220)	(654)
Share of result of associates and joint ventures		(152)	(153)
Cash flow from operating activities before changes in working capital and use of provisions		**21 019**	**21 227**
Decrease/(increase) in trade and other receivables		(258)	(105)
Decrease/(increase) in inventories		(426)	(588)
Increase/(decrease) in trade and other payables		679	1 170
Pension contributions and use of provisions		(715)	(487)
Cash generated from operations		**20 299**	**21 217**
Interest paid		(4 450)	(4 559)
Interest received		523	429
Dividends received		160	141
Income tax paid		(3 136)	(3 047)
Cash flow from operating activities		**13 396**	**14 181**

Alternatively, the indirect method of presentation can show separately revenues and expenses, adjusted for non-cash, investing or financing items, making up operating profit before working capital changes. *[IAS 7.20]*. An example of this rarely used alternative is given at the end of Appendix A to IAS 7.

When an entity adopts the indirect method, the reconciliation should start either with profit or loss before tax (as in Extract 40.6 above) or profit or loss after tax (as in Extract 40.8 above). Any other basis, such as EBITDA, EBIT, or profit or loss excluding non-controlling interests, does not meet the requirement in IAS 7 for adjusting 'profit or loss', *[IAS 7.20]*, which includes 'all items of income and expense in a period'. *[IAS 1.88]*.

To obtain the information on working capital movements for the indirect method, the figures in the statement of financial position must be analysed according to the three standard headings of the statement of cash flows. Thus, the reconciliation of profit or loss to cash flow from operating activities will include, not the increase or decrease in all receivables or payables, but only in respect of those elements thereof that relate to operating activities. For example, amounts owed in respect of the acquisition of property, plant and equipment (other than assets held for rental and subsequent sale), intangible assets, or non-operational investments will be excluded from the movement in payables included in this reconciliation. Although this may not present practical difficulties in the preparation of a single-entity statement of cash flows, it is important that sufficient information is collected from subsidiaries for preparing the group statement of cash flows.

Furthermore, when a group has acquired a subsidiary during the year, the change in working capital items will have to be split between the increase due to the acquisition (to the extent that the purchase consideration was settled in cash, this will be shown under investing activities) and the element related to post-acquisition operating activities which will be shown in the reconciliation. In a similar way, if a group has disposed of a subsidiary during the year, the changes in the working capital items in the reconciliation will exclude the movements relating to the working capital of the subsidiary that has left the group. Further additional considerations needed when preparing a statement of cash flows for a group are explained at 6 below.

4.2 Cash flows from investing activities

Investing activities are defined as 'the acquisition and disposal of long-term assets and other investments not included in cash equivalents'. *[IAS 7.6].* This separate category of cash flows allows users of the financial statements to understand the extent to which expenditures have been made for resources intended to generate future income and cash flows. Cash flows arising from investing activities include:

(a) payments to acquire, and receipts from the sale of, property, plant and equipment, intangibles and other long-term assets (including payments and receipts relating to capitalised development costs and self-constructed property, plant and equipment);

(b) payments to acquire, and receipts from the sale of, equity or debt instruments of other entities and interests in jointly controlled entities (other than payments and receipts for those instruments considered to be cash equivalents or those held for dealing or trading purposes);

(c) advances and loans made to, and repaid by, other parties (other than advances and loans made by a financial institution); and

(d) payments for, and receipts from, futures contracts, forward contracts, option contracts and swap contracts, except when the contracts are held for dealing or trading purposes, or the cash flows are classified as financing activities (see 4.4.12 below regarding allocation of cash flows on derivative contracts). *[IAS 7.16].*

However, as part of its annual improvement project, the IASB added in 2008 that only expenditures that result in a recognised asset in the statement of financial position are eligible for classification as investing activities. *[IAS 7.16].* Therefore, cash flows relating to costs recognised as an expense cannot be classified within investing activities. As a result, payments including those for exploration and evaluation activities and for research and development that are recognised as an asset are classified as investing cash flows, while entities that recognise such expenditures as an expense would classify the related payments as operating cash flows.

This requirement was added in response to submissions made to the Interpretations Committee about the classification of expenditure incurred with the aim of generating future revenues, but that may not always result in the recognition of an asset. Examples included exploration and evaluation expenditure, advertising and promotional activities, staff training, and research and development. *[IAS 7.BC3]*. The IASB believes this approach aligns the classification of investing cash flows with the presentation in the statement of financial position; reduces divergence in practice and, therefore, results in financial statements that are easier for users to understand. *[IAS 7.BC7]*. It does not seem unreasonable that recurrent expenditure on items such as research and expensed mining costs should be classified as operating cash flows. However, application to other items that do not give rise to an asset in the statement of financial position, such as acquisition-related costs (discussed at 6.3.1 below) and the settlement of contingent consideration in a business combination (discussed at 6.3.3 below) may prove to be more complicated.

The Interpretations Committee and the IASB have discussed the application of this requirement in practice, as some users appear to have given precedence to the classification of cash flows consistently with the classification of the related item in the statement of financial position, *[IAS 7.BC7]*, (sometime referred to as the 'cohesiveness principle') over the objective in the standard to classify cash flows in accordance with the nature of the activity giving rise to the cash flow. *[IAS 7.11]*. In its discussion, the IASB agreed that the primary principle for the classification of cash flows should be in accordance with the nature of the activity, and that the requirement for the recognition of an asset should be read as a constraint on the application of the primary principle, rather than as a competing principle.[9]

Major classes of gross receipts and gross payments arising from investing activities are reported separately, except for those items that IAS 7 permits to be reported on a net basis, as discussed at 5.2 below. *[IAS 7.21]*.

4.3 Cash flows from financing activities

Financing activities are defined as those 'activities that result in changes in the size and composition of the contributed equity and borrowings of the entity'. *[IAS 7.6]*. The standard states that this information is useful in predicting claims on future cash flows by providers of capital to the entity. *[IAS 7.17]*. However, it would seem more likely that information on financing cash flows would indicate the extent to which the entity has had recourse to external financing to meet its operating and investing needs in the period. The disclosure of the value and maturity of the entity's financial liabilities, as required by IFRS 7 – *Financial Instruments: Disclosures*, would contribute more to predicting future claims on cash flows. *[IFRS 7.39]*.

Cash flows arising from financing activities include:

(a) proceeds from issuing shares or other equity instruments;

(b) payments to owners to acquire or redeem the entity's shares;

(c) proceeds from issuing, and outflows to repay, debentures, loans, notes, bonds, mortgages and other short or long-term borrowings; and

(d) payments by a lessee for the reduction of the outstanding liability relating to a lease. *[IAS 7.17]*.

In consolidated financial statements, financing cash flows will include those arising from changes in ownership interests in a subsidiary that do not result in a loss of control (see 6.2 below). *[IAS 7.42A]*.

Major classes of gross receipts and gross payments arising from financing activities should be reported separately, except for those items that can be reported on a net basis, as discussed at 5.2 below. *[IAS 7.21]*.

Disclosure requirements in respect of changes in liabilities arising from financing activities are discussed at 5.6 below.

4.4 Allocating items to operating, investing and financing activities

Sometimes it is not clear how cash flows should be classified between operating, investing and financing activities. IAS 7 provides additional guidance on the classification of certain transactions, including interest, dividends and income taxes, while other questions are not addressed explicitly in the standard. These, as well as some common areas where judgement may be required to classify cash flows, are discussed below.

4.4.1 Interest and dividends

An entity is required to disclose separately cash flows from interest and dividends received and paid, and their classification as either operating, investing or financing activities should be applied in a consistent manner from period to period. *[IAS 7.31]*. For a financial institution, interest paid and interest and dividends received are usually classified as operating cash flows. However, IAS 7 notes that there is no consensus on the classification of these cash flows for other entities and suggests that:

- interest paid may be classified under either operating or financing activities; and
- interest received and dividends received may be included in either operating or investing cash flows. *[IAS 7.33]*.

The standard allows dividends paid to be classified as a financing cash flow (because they are a cost of obtaining financial resources) or as a component of cash flows from operating activities. *[IAS 7.34]*.

In Extract 40.6 at 4 above, AstraZeneca has included interest paid under operating activities, interest received under investing activities and dividends paid under financing activities, as permitted by the standard. A different treatment is adopted by Anheuser-Busch InBev in Extract 40.8 at 4.1.2 above, where interest paid, interest received and dividends received are all disclosed as operating cash flows.

All of these treatments are in compliance with the standard; however, the most appropriate treatment will depend on the nature of the entity and its activities. For example, if an entity does not include interest received or dividends received within revenue it may be more appropriate to include the interest or dividend cash inflows as investing cash flows rather than operating cash flows. This is because cash flows from operating activities are primarily derived from the principal revenue-producing activities of the entity, *[IAS 7.14]*, and the amount of cash flows arising from operating activities is intended to be a key indicator of the extent to which the operations of the entity have generated sufficient cash flows to repay loans, pay dividends and make new investments without recourse to external sources of financing. *[IAS 7.13]*. Similarly, an entity could treat interest and dividends paid as financing cash flows because they are a cost of obtaining financial resources. *[IAS 7.34]*. In addition, the standard requires the total amount of interest paid during the period to be disclosed in the statement of cash flows, whether it has been recognised as an expense or capitalised as part of the cost of an asset in accordance with IAS 23 – *Borrowing Costs*. *[IAS 7.32]*. A literal reading of this requirement might suggest that interest paid should be presented as a single figure under operating or financing activities. However, it would also seem appropriate to include the cash outflow relating to capitalised borrowing costs under investing activities, provided that when this is done, the total amount of interest paid is also disclosed, either on the face of the statement of cash flows or in the notes. This gives rise to an apparent inconsistency between paragraph 16 of IAS 7 and paragraphs 32 to 33 of IAS 7, but attempts to clarify the issue through an annual improvement[10] received negative feedback from respondents and ultimately no amendment was made.[11]

Where an entity has issued shares that are classified as financial liabilities in accordance with IAS 32 – *Financial Instruments: Presentation* (see Chapter 47), the dividends paid on those shares should be presented in the statement of cash flows as either operating or investing, in line with the entity's presentation of other interest paid.

4.4.2 Taxes on income

Cash flows arising from taxes on income should be separately disclosed within operating cash flows unless they can be specifically identified with investing or financing activities. *[IAS 7.35]*.

Whilst it is possible to match elements of tax expense to transactions for which the cash flows are classified under investing or financing activities; taxes paid are usually classified as cash flows from operating activities because it is often impracticable to match tax cash flows with specific elements of tax expense. Also, those tax cash flows may arise in a different period from the underlying transaction. *[IAS 7.36]*. This is the presentation adopted by Anheuser-Busch InBev in Extract 40.8 at 4.1.2 above. However, when it is practicable to make this determination, the tax cash flow is identified as an investing or financing activity in accordance with the individual transaction that gives rise to such cash flows. In cases where tax cash flows are allocated over more than one class of activity, the entity should disclose the total amount for taxes paid. *[IAS 7.36]*.

4.4.3 Sales taxes and other non-income tax cash flows

Although it provides guidance on the treatment of taxes on income, IAS 7 does not specifically address the treatment of cash flows relating to other taxes, such as value added tax (VAT) or other sales taxes and duty. The Interpretations Committee has considered whether it should add the question about VAT to its agenda and decided that it was not appropriate to develop an interpretation. Instead, it suggested that the issue of cash flows relating to VAT be considered by the IASB in its review of IAS 7 as part of the project on Financial Statement Presentation.

In explaining why, it would not add this question to its agenda, the Interpretations Committee noted that 'IAS 7 does not explicitly address the treatment of VAT' and added that 'while different practices may emerge, they are not expected to be widespread'.[12]

Therefore, it seems that entities can choose to disclose VAT receipts and VAT payments separately in the statement of cash flows or as part of the related cash inflows and outflows. Given the availability of alternative treatments, the Interpretations Committee noted that it would be appropriate in complying with IAS 1 – *Presentation of Financial Statements* – for entities to disclose whether cash flows are presented inclusive or exclusive of related VAT.[13] We believe that the same principles should be applied for other non-income taxes.

4.4.4 Cash contributions to a long-term employee benefit fund

As discussed at 4.1 above, the definition of operating activities in IAS 7 includes as one of its examples 'cash payments to and on behalf of employees'. *[IAS 7.14(d)]*. Such cash outflows would typically involve wages and salaries paid to employees, taxes paid on behalf of employees and any other employee benefit contributions made on behalf of employees. Where a company makes contributions to a long-term employee benefit fund on behalf of its employees, those cash outflows are part of the compensation for employment services and would be classified as operating cash flows as they are derived from the principal-revenue-producing activities of the entity.

4.4.5 Cash flows from factoring of trade receivables

Another question not explicitly addressed in the standard is the classification of cash receipts from the factoring of trade receivables.

In the case of debt factoring, an entity aims to provide cash flow from trade receivables more quickly than would arise from normal collection from customers, generally by transferring rights over those receivables to a financial institution. In our view, the classification of the cash receipt from the financial institution depends on whether the transfer results in derecognition of the trade receivables, or to the continued recognition of the trade receivables and the recognition of a financial liability for the funding received from the factoring entity. The characteristics determining which of these accounting treatments would be appropriate are discussed in Chapter 52 at 4.5 and 5.

Only to the extent that the factoring arrangement results in the derecognition of the original trade receivable would it be appropriate to regard the cash receipt in the same way as any other receipt from the sale of goods and rendering of services and classify it in operating activities. *[IAS 7.14(a)]*. In cases where the trade receivable is not derecognised and a liability is recorded, the nature of the arrangement is a borrowing secured against trade receivables and accordingly we believe that the cash receipt from factoring should be treated in the same way as any short-term borrowing and included in financing activities. *[IAS 7.17(c)]*. The later cash inflow from the customer for settlement of the trade receivable would be included in operating cash flows and the reduction in the liability to the financial institution would be a financing outflow. Following the principle in IFRS 9 for the disclosure of income and expenditure relating to a transferred asset that continues to be recognised, *[IFRS 9.3.2.22]*, these two amounts would not be offset in the statement of cash flows. However, it would be acceptable for the entity to disclose the net borrowing receipts from, and repayments to, the financial institution, if it was determined that these relate to advances made for and the repayment of short-term borrowings such as those which have a maturity period of three months or less. *[IAS 7.23A(c)]*. In some cases, the factoring arrangement requires customers to remit cash directly to the financial institution. When the transfer does not give rise to derecognition of the trade receivable by the reporting entity, we believe that it will usually be appropriate for the entity to reflect the later settlement of the debt by the customer as a non-cash transaction with no cash flows reported at the time of the ultimate derecognition of the trade receivable and the related factoring liability. However, the reporting entity may consider that the factoring entity is acting as its agent and is therefore collecting the cash on its behalf before drawing down amounts to settle the liability it is owed by the reporting entity. In this case the entity would report an operating cash inflow from the customer and a financing cash outflow to the financial institution.

4.4.6 Cash flows from supply-chain financing and reverse factoring arrangements

In the case of supply-chain financing or reverse factoring arrangements, typically, the entity aims to defer cash flows from the settlement of a trade payable for the supply of goods or services through an arrangement with a financial institution which will settle the liability to the supplier and will be repaid by the entity (see Chapter 54 at 7.4.3.A for further explanation).

Supply-chain finance arrangements can be varied and complex; however, the common link is simply that the financial institution pays the supplier before it is, in turn, paid by the purchaser. The primary accounting concern with these types of arrangements is therefore whether the liability to the financial institution should be presented as debt or as a trade or similar payable. However, such schemes also raise questions as to their presentation in the statement of cash flows.

The Interpretations Committee discussed the application of IFRS Standards to the reverse factoring arrangements in their June 2020 meeting. The committee described reverse factoring arrangements simply as ones in which a financial institution agrees to pay amounts an entity owes to the its suppliers and the entity agrees to pay the financial institution at a date later than suppliers are paid.

The committee issued a tentative agenda decision outlining how IFRS standards are applied to the different aspects of accounting for such arrangements, in particular on the classification of liabilities and disclosures about liquidity risks of such arrangements. Details of the tentative agenda decision and the impact on the statement of financial position can be found in Chapter 54 at 7.4.3.B and on the notes to the financial statements in Chapter 54 at 7.4.3.E.

An entity that has entered into a reverse factoring arrangement, would need to determine whether to classify cash flows under the arrangement as cash flows from operating activities or cash flows from financing activities.

This in turn poses the following challenges:

- Should the presentation of the liability to the financial institution in the statement of financial position impact the presentation of cash flows? For example, if the liability is presented outside of trade payables, should the ultimate payment to the financial institution be presented as a financing outflow? Or should it instead be presented as an operating cash flow based on the nature of the activities that initially led to the recognition of the trade payable that was settled through the supply-chain financing?
- Should the remittance of cash directly to the supplier by the financial institution be reflected at all in the statement of cash flow or is it a non-cash transaction?

With respect to the first question above, the committee observed in its tentative agenda decision, that an entity's assessment of the nature of the liabilities that are part of the arrangement may help in determining the nature of the related cash flows as arising from operating or financing activities. For example, if the entity considers the related liability to be a trade or other payable that is part of the working capital used in the entity's principal revenue-producing activities, the entity presents cash outflows to settle the liability as arising from operating activities in its statement of cash flows. In contrast, if the entity considers that the related liability is not a trade or other payable because the liability represents borrowings of the entity, the entity presents cash outflows to settle the liability as arising from financing activities in its statement of cash flows.

As regards the identification of cash flows and the second question above, the tentative agenda decision of the committee noted that transactions that do not require the use of cash shall be excluded from a statement of cash flows. *[IAS 7.43]*. The committee went on to state 'consequently, if a cash inflow and cash outflow occur for an entity when an invoice is factored as part of a reverse factoring arrangement, the entity presents those cash flows in its statement of cash flows. If no cash flows are involved in a financing transaction of an entity, the entity discloses the transaction elsewhere in the financial statements in a way that provides all the relevant information about the financing activity'.

It is our view that this text may be interpreted differently by constituents and, as such may not resolve diversity in practice. In particular, the tentative agenda decision currently states the obvious, that is if no cash flows are involved, then no cash flows should be presented in the cash flow statement. However, it has been observed that certain entities consider that the relationship between themselves and the financial institution is, in substance, a principal/agent relationship. Such a conclusion would imply that the financial institution is acting as an agent of the entity and is, therefore, incurring cash flows on behalf of the entity when paying the supplier. It is unclear in the tentative agenda decision as to whether such an analysis would be appropriate.

As a result, we see different approaches being applied in practice:

- One approach is to treat the payment of the supplier by the financial institution as a non-cash transaction from the entity's perspective and the repayment of the financial institution as a financing or operating cashflow depending on whether the liability to the financial institution is shown, respectively, as a trade or similar payable or as debt.
- Another approach is to treat the payment of the supplier by the financial institution as a non-cash transaction from the entity's perspective and the repayment of the financial institution as an operating cashflow based on the nature of activities for which the trade payable was initially recognised, regardless of the classification of the liability in the statement of financial position.
- A third approach is to report an operating cash outflow and a financing cash inflow when the financial institution remits payment to the supplier in an arrangement that is deemed to be a financing arrangement, with the subsequent payment to the financial institution being reported as a financing cash outflow.

In its tentative agenda decision, the committee rightfully observed that assessing how to present liabilities and cash flows related to reverse factoring arrangements may involve judgement and emphasised the requirement in IAS 1 to disclose judgements that management has made in this respect if they are among the judgements made that have the most significant effect on the amounts recognised in the financial statements *[IAS 1.122]* as well as any information that is relevant to an understanding of any of the entity's financial statements. *[IAS 1.112]*.

Lastly, we would also point out that, currently, the tentative agenda decision suggests that the decision is whether to classify the associated cash flows as operating or financing activities. However, we note that if the cost of the goods or services is capitalised into a longer-term asset such as property, plant and equipment, or possibly an intangible asset, the classification decision would be between investing and financing activities. This may be particularly relevant in asset intense industries such as telecommunications or the extractive industries.

The committee noted that the effects of reverse factoring arrangements may also need to be included in the disclosure of:

- changes in liabilities arising from financing activities, as required by paragraph 44A of the standard (see 5.6 below). If an entity classifies the cash flows arising from a reverse factoring arrangement as financing, or will do so in the future, the related liabilities and cash and non-cash changes should be included in this disclosure; and
- liquidity risk, as required by IFRS 7 *[IFRS 7.33-35, 39, B11F]* because the entity has concentrated a portion of its liabilities with one financial institution rather than a diverse group of suppliers – see Chapter 54 at 7.4.3.E. Also, some suppliers may have become accustomed to, or reliant on, earlier payment of their trade receivables under the reverse factoring arrangement. If the financial institution were to withdraw the reverse factoring arrangement, those suppliers could demand shorter credit terms, which would affect the entity's liquidity, particularly if the entity were already in financial distress.

In practice, the appropriate level of disclosures for any reverse factoring arrangement is likely to involve a high degree of judgement. We believe that, whatever the presentation adopted, additional disclosure will be necessary whenever these arrangements have a material impact to explain the nature of the arrangements and amounts involved, the financial reporting judgements made and impacts thereof on the financial statements and, more specifically, the level of debt and the statement of cash flows.

At the time of writing, the IFRS interpretation committee has not yet revisited its tentative agenda decision based on comments received and is expected to do so at its December 2020 meeting. However, in accordance with the revised Due Process Handbook published in August 2020, the committee must formally involve the Board in the process of finalising its agenda decision and this could delay publication until the very last days of December 2020.

4.4.7 Property, plant and equipment held for rental

Payments to acquire and receipts from the sale of, property, plant and equipment are usually included in investing cash flows; however, this is not always the case.

A number of entities routinely sell assets that were previously held for rental, for example, car rental companies that acquire vehicles with the intention of holding them as rental cars for a limited period and then selling them. IAS 16 – *Property, Plant and Equipment* – requires an entity, that, in its ordinary course of business, routinely sells items of property, plant and equipment that it has held for rental to others, to classify gains on the sale of such property, plant and equipment as revenue. *[IAS 16.68A]*. Accordingly, the proceeds from the sale of such assets are classified as cash flows from operating activities, as are cash payments to manufacture or acquire property, plant and equipment held for rental to others and routinely sold in the ordinary course of business. *[IAS 7.14]*.

The requirement to classify payments for such property, plant and equipment held for rental under operating cash flows is intended to avoid initial expenditure on purchases of assets being classified as investing activities, while inflows from sales are recorded within operating activities. However, this means that management will need to determine, at the time of acquisition or manufacture, which of the assets that it intends to rent out will be ultimately held for sale in the ordinary course of business

4.4.8 Cash received as compensation for an insured loss

As noted in 4.2 above, cash flows arising from investing activities include receipts from the sale of property, plant and equipment and other long-term assets. *[IAS 7.16(b)]*. This classification would also be appropriate if the receipt of cash came from insurance proceeds received to cover for the loss or damage of such assets. It would not be appropriate to present the cash inflow as an operating cash flow as the insurance proceeds are not derived from the principal-revenue-producing activities of the business. *[IAS 7.14]*. However, the nature of the claim giving rise to the cash inflow should be carefully considered. If the claim relates only partially to the loss of damage of a long-term asset, it may be necessary for the cash inflows to be allocated between cash flows from operating activities (e.g., for the compensation for business interruption) and cash flows from investing activities.

4.4.9 *Cash flows for service concession arrangements*

Because a cash flow is only classified in investing activities if it results in a recognised asset in the statement of financial position, a question arises regarding the classification of the cash inflows and outflows of the operator of a service concession arrangement that is within the scope of IFRIC 12 – *Service Concession Arrangements*.

IFRIC 12 features two possible accounting models – the intangible asset model or the financial asset model. Under both models, the service element relating to the construction of the infrastructure asset is accounted for in accordance with IFRS 15 and the revenue recognised gives rise to an intangible or a financial asset, in the form of a receivable, respectively. It is unclear whether cash flows incurred in the construction or upgrade phase should always be regarded as operating cash flows because they relate to the provision of construction services; or whether they are more accurately classified as investing activities, as they reflect cash outflows that result in the recognition of an asset.

In the case of an arrangement under the intangible asset model, the cash flows incurred during construction or upgrading could be classified in investing activities as they relate to the acquisition of an intangible that will generate future income and cash flows. Once the operating phase is reached, the cash inflows received would be most appropriately classified in operating activities as most operating and maintenance costs are likely to be executory and will be accounted for as incurred.

On the other hand, when the financial asset model applies, cash outflows during the construction phase may considered to represent the provision of financing to the grantor and as such a financing outflow. In a corollary of the discussion on deferred payments at 5.4 below, where the time value of money is significant to the transaction, the transaction may be tantamount to providing a loan. In this case the repayment of such an instrument by the grantor during the operating phase could be considered an investing cash flow (or potentially split between investing and operating cash flows for the capital and interest components respectively, depending on the policy of the entity).

Since there is no specific guidance relating to the classification of cash flows for service concession arrangements, current practice is mixed. IFRIC 12 is discussed in more detail in Chapter 25.

4.4.10 *Treasury shares*

Treasury shares are an entity's own equity instruments that are acquired and held by the entity, a subsidiary, or other members of the consolidated group. The consideration paid or received for treasury shares is recognised directly in equity and not as a movement in investments. *[IAS 32.33]*. As such, it should be clear that payments and receipts to acquire or dispose of treasury shares should be classified within financing activities. *[IAS 7.17]*. Even where such treasury shares are acquired by the entity as part of an equity-settled share-based payment transaction, the cash outflow should be classified under financing activities. Whilst cash payments to and on behalf of employees are classified under operating activities, *[IAS 7.14]*, the acquisition of treasury shares does not settle a transaction between the entity and its employees. An equity-settled share-based payment transaction is completed when the entity transfers its equity instruments to employees in consideration for the services received.

When a cash payment is made by a subsidiary to its parent or a trust that holds treasury shares as part of an equity-settled share-based payment arrangement, the payment should be accounted for as a deduction from equity in the separate financial statements of the subsidiary, on the grounds that the payment does not settle the transaction with the employees, but is effectively a distribution to the parent or the trust (see Chapter 34 at 12.2.7). Having regarded this as a distribution, it follows that the cash flow should be classified as either operating or financing, according to the entity's policy on dividends as discussed at 4.4.1 above.

4.4.11 Cash flows related to the costs of a share issue

Costs directly related to the issue of shares are required to be deducted from equity. *[IAS 32.35]*. As the costs reduce the amount of the proceeds received from the share issue, they should be classified as a financing cash flow. *[IAS 7.17(a)]*. However, where a proposed share issue is cancelled, there would be no proceeds from the issue to record and the related expenses would be included in profit and loss rather than equity. As such, the definition of a financing cash flow would not be met, and the transaction costs would be classified in operating cash flows.

4.4.12 Cash flows on derivative contracts

Payments and receipts relating to derivative contracts can be classified within operating, investing or financing in different circumstances. Where the contract is held for dealing or trading purposes, the cash flows are classified under operating activities. *[IAS 7.14]*. IAS 7 requires that payments for, and receipts from, futures contracts, forward contracts, option contracts and swap contracts are classified as cash flows from investing activities, except when the contracts are held for dealing or trading purposes, or the cash flows are classified as financing activities. *[IAS 7.16]*.

The standard adds that when a contract is accounted for as a hedge of an identifiable position, the cash flows of the contract are classified under the same heading as the cash flows of the position being hedged. *[IAS 7.16]*. An example is an interest rate swap. An entity wishing to convert an existing fixed rate borrowing into a floating rate equivalent could enter into an interest rate swap under which it receives interest at fixed rates and pays at floating rates. All the cash flows under the swap should be reported under the same cash flow heading as interest paid (i.e. as financing activities or operating activities, in accordance with the entity's determined policy, as discussed at 4.4.1 above), because they are equivalent to interest or are hedges of interest payments.

More generally, IFRS 9 adds to the requirements of IAS 7 by clarifying that cash flows arising from hedging instruments are classified as operating, investing or financing activities, on the basis of the classification of the cash flows arising from the hedged item and that this should be consistent with the classification of these instruments as hedging instruments under IFRS 9. *[IFRS 9.IG.G.2]*.

This seems to leave an open question as to how an entity should classify the cash flows from a derivative contract that is considered by management as part of a hedging relationship, but for which the entity elects not to apply hedge accounting (taking all movements to profit or loss) or for which hedge accounting is not permitted under IFRS 9? Consider the following example.

Example 40.1: Cash flows from derivatives not designated as hedges

Company A has the euro as its functional currency. On 1 January 2020, it sells goods to a US customer for which it charges US$1,000,000. The spot exchange rate on this date is 1:1 and it recognises revenue of €1,000,000. Payment is due to be received on 30 June 2020. A enters into a forward contract to exchange US$1,000,000 for €1,095,000 on 30 June 2020. It does not designate it as a hedge because the effects of movements on the contract and those of retranslating the receivable will already offset in profit or loss. On 30 June 2020 the exchange rate is such that A receives the equivalent of €1,200,000 from its customer and pays €105,000 on the forward contract.

Taken literally, IAS 7 would suggest that the receipt from the customer of €1,200,000 is classified as an operating cash inflow; but, because the forward contract is not held for dealing or trading purposes and is not accounted for as a hedge of an identifiable position, the €105,000 cash outflow on the forward contract cannot be classified under operating activities. As such, the €105,000 would have to appear in investing or possibly financing cash flows. However, had the entity elected to apply hedge accounting, the standard would require the €105,000 to be included in operating cash flows.

In our opinion, since IAS 7 as not been updated to reflect IFRS 9, the requirements to classify cash flows arising from hedging instruments consistently with the classification of the cash flows arising from the hedged item are not restricted only to those hedging relationships that either are designated as hedges under IFRS 9, or would otherwise qualify for hedge accounting had they been so designated. Accordingly, in Example 40.1 above, entity A could include the payment on the forward contract in cash flows from operating activities.

4.4.13 Debt instrument issued at a discount or redeemed at a premium

Cash outflows that represent the repayment of the principal amount of a loan or other debt instrument are classified as financing activities. *[IAS 7.17]*. As noted in 4.4.1 above, interest paid may be classified under either operating or financing activities. Therefore, where an entity adopts a policy of classifying interest under operating activities, it may be necessary to carefully consider the nature of any payment to the lender to ensure the appropriate classification between operating and financing. This will be particularly relevant where the pattern of interest payments differs from the recognition of the interest expense in profit or loss.

For example, a company that issues a zero-coupon bond at nominal value, with a premium payable on redemption, will not make any interest payments over the life of the bond. However, in accounting for the financial liability at amortised cost under IFRS 9, the entity will recognise interest at the EIR, calculated to reflect the premium payable on redemption, as explained in Chapter 50 at 3.1. In our view, when the cash paid on redemption is presented in the statement of cash flows, a split should be made to appropriately show the amount that relates to the interest cost (within operating activities) and the amount that relates to the prepayment of the principle (within financing activities).

The same principles would be applied where a debt is issued at a discount or in any other situation where the pattern of cash flows relating to interest on a financial liability are not reflected in the pattern of recognition of the interest cost.

4.4.14 Early settlement of a debt instrument

A similar issue to that discussed in 4.4.13 above is how an entity should present the cash payments on early settlement of a loan or other borrowing. As already noted at 4.3 above, cash flows arising from financing activities include outflows to repay borrowings. However, in some situations an element of the cash paid on early settlement could be viewed as compensation to the lender for lost interest.

Lenders will often include a prepayment penalty provision in loan agreements that can be based on a number of factors, including an approximation of the interest that will not be paid as a result of early settlement. This would support a split presentation of the cash outflow between repayment of borrowings and cash outflow for interest. Alternatively, the nature of the entire cash outflow may also be viewed as relating to a financing activity, being the extinguishment of a liability, which should be presented as one amount in the financing activities section of the statement.

4.4.15 Classification of cash flows – future developments

In December 2019, the IASB issued Exposure Draft ED/2019/7 – *General Presentation and* Disclosures (the ED) in which the Board proposes to replace IAS 1 with a new standard and to make limited changes to the statement of financial position and the statement of cash flows.

The ED proposes to eliminate the current policy choice for classification of cash flows from interest and dividends in the statement of cash flows. For non-financial entities, dividends and interest paid should be classified as financing cash flows, whilst dividends and interest received should be classified as investing cash flows. Within the cash flows from investing activities section of the statement of cash flows, the cash flows from integral associates and joint ventures should be presented separately from non-integral associates and joint ventures based on the same classification as was applied in the statement of financial performance.

When applying the indirect approach, the ED clarifies that the starting point for the reconciliation is the operating profit subtotal.

For financial entities, cash flows from dividends received, interest paid and interest received should each be presented in a single category, that is, either as operating, investing or financing in a manner consistent with the presentation of the related income and expenses in the statement of financial performance.

The ED is discussed further in Chapter 3 at 6.1.2.

5. OTHER CASH FLOW PRESENTATION ISSUES

5.1 Material cash flows

IAS 1 requires the nature and amount of material items of income and expense to be disclosed separately. *[IAS 1.97]*. It also requires additional line items, headings and sub-totals to be presented on the face of the statement of financial position or of the statement(s) presenting profit or loss and other comprehensive income when this is relevant to an understanding of the entity's financial position. *[IAS 1.55, 85]*. In our view, although IAS 7 is silent on the matter, it would be similarly appropriate for material cash flows or cash flows relating to material items in the statements of financial position or of comprehensive income to be presented as separate line items on the face of the statement of cash flows, provided that they remain classified according to their nature as either operating, investing or financing cash flows.

5.2 Gross or net presentation of cash flows

In general, major classes of gross receipts and gross payments should be reported separately. *[IAS 7.21]*. Operating, investing or financing cash flows can be reported on a net basis if they arise from:

(a) cash flows that reflect the activities of customers rather than those of the entity and are thereby made on behalf of customers; or

(b) cash flows that relate to items in which the turnover is quick, the amounts are large, and the maturities are short. *[IAS 7.22]*.

Examples of cash receipts and payments that reflect the activities of customers rather than those of the entity include the acceptance and repayment of demand deposits by a bank, funds held for customers by an investment company and rents collected on behalf of, and paid over to, the owners of properties. *[IAS 7.23]*. Other transactions where the entity is acting as an agent or collector for another party would be included in this category, such as the treatment of cash receipts and payments relating to concession sales.

Examples of cash receipts and payments in which turnover is quick, the amounts are large, and the maturities are short include advances made for and the repayment of:

(a) principal amounts relating to credit card customers;

(b) the purchase and sale of investments; and

(c) other short-term borrowings, such as those with a maturity on draw down of three months or less. *[IAS 7.23A]*.

An example noted in IAS 20 – *Accounting for Government Grants and Disclosure of Government Assistance* – where gross presentation is deemed appropriate for major classes of cash flows is the receipt of government grants, which 'are often disclosed as separate items in the statement of cash flows regardless of whether or not the grant is deducted from the related asset for presentation purposes in the statement of financial position'. *[IAS 20.28]*.

Neither IAS 20 nor IAS 7 provide guidance on where in the statement of cash flows to present the cash inflows from the receipt of government grants related to assets. The Interpretations Committee discussed the presentation of cash flows for several fact patterns including government grants in July 2012.[14] The issue was further discussed in March 2013 and no conclusion was reached.[15] As such there is likely to be diversity in practice. The presentation principles adopted should be applied consistently and clear disclosure of the principles and the impact thereof on the statement of cash flows presented should be provided in accordance with IAS 1.

Government grants are discussed in more detail in Chapter 24.

See 7.2 below for discussion of the gross or net presentation of cash flows for financial institutions.

5.3 Foreign currency cash flows

IAS 21 – *The Effects of Changes in Foreign Exchange Rates* – excludes from its scope the translation of cash flows of a foreign operation and the presentation of foreign currency cash flows in a statement of cash flows. *[IAS 21.7]*. Nevertheless, IAS 7 requires foreign currency cash flows to be reported in a manner consistent with IAS 21. *[IAS 7.27]*.

Accordingly, cash flows arising from transactions in a foreign currency should be reported in an entity's functional currency in the statement of cash flows by applying the exchange rate in effect at the date of the cash flow. *[IAS 7.25]*. Similarly, the cash flows of a foreign subsidiary should be translated using the exchange rates prevailing at the dates of the cash flows. *[IAS 7.26]*.

For practical reasons, an entity can apply a rate that approximates the actual rate on the date of the cash flow (such as a weighted average for a period) but, like the requirements of IAS 21 for income and expenses, translation using the exchange rate as at the end of the reporting period is not permitted. *[IAS 7.27]*. The requirements for entities falling within the scope of IAS 29 – *Financial Reporting in Hyperinflationary Economies* – are discussed in Chapter 16.

Unrealised gains and losses arising from exchange rate movements on foreign currency cash and cash equivalents are not cash flows. However, it is necessary to include these exchange differences in the statement of cash flows in order to reconcile the movement in cash and cash equivalents at the beginning and end of the period. The effect of exchange rate movements on cash and cash equivalents is presented as a single amount at the foot of the statement of cash flows, separately from operating, investing and financing cash flows and includes the differences, if any, had those cash flows been reported at end of period exchange rates. *[IAS 7.28]*. An example of this is illustrated in Extract 40.6 at 4 above.

5.3.1 Entities applying the direct method

When an entity enters into a transaction denominated in a foreign currency, there are no consequences for the statement of cash flows until payments are received or made. The receipts and payments will be recorded in the entity's accounting records at the exchange rate prevailing at the date of payment and these amounts should be reflected in the statement of cash flows. *[IAS 7.25]*.

The consolidated statement of cash flows prepared under the direct method uses the foreign currency financial statements of each foreign subsidiary as the starting point. This means that cash flows are measured first in the functional currency of the subsidiary and then retranslated into the currency in which the consolidated financial statements are presented.

5.3.2 Entities applying the indirect method

Under the indirect method, profit or loss is adjusted for the effects of transactions of a non-cash nature, any deferrals of operating cash receipts or payments and income or expenses associated with investing or financing cash flows. *[IAS 7.18]*. Exchange differences will be included in profit or loss when the settled amount differs from the amount recorded at the date of the transaction. Likewise, if the transaction remains unsettled at the reporting date, exchange differences will also be taken to profit or loss on the retranslation of the unsettled monetary items at closing rates. Entities must therefore determine what adjustments should be made to ensure that foreign currency items are only included in the statement of cash flows to the extent that cash flows have occurred.

5.3.2.A Treatment of operating cash flows

Where the exchange differences relate to operating items such as sales or purchases of inventory by an entity, no adjustments need to be made when the indirect method of calculating the cash flow from operating activities is used. For example, if a sale transaction and cash settlement take place in the same period, the operating profit will include both the amount recorded at the date of sale and the amount of the exchange difference on settlement, the combination of which gives the amount of the actual cash flow. Even if settlement has not taken place until after the end of the period, no adjustment would be needed as the unrealised exchange gain or loss would already be reflected in the movement in the related receivable included in the reconciliation to operating profit.

5.3.2.B Treatment of non-operating cash flows

Any exchange difference arising on a settled transaction relating to non-operating cash flows will give rise to an adjustment between reported profit and the cash flow from operating activities.

For example, the foreign currency purchase of property, plant and equipment would be recorded initially at the rate prevailing on the date of the transaction. The difference on payment of the foreign currency payable would be taken to the statement of comprehensive income as an exchange gain or loss. If left unadjusted in the statement of cash flows, the investing cash flow for the asset purchase would be recorded at the historical rate, rather than at the exchange rate prevailing at the date of settlement. This difference needs to be considered in calculating the cash flow to be shown under the relevant classification, in this case investing cash flows, which would otherwise be recorded at the amount shown in the note of the movements in property, plant and equipment.

5.3.2.C The indirect method and foreign subsidiaries

Entities should exercise care when applying the indirect method at the 'more consolidated level' as described at 6.1 below when there are foreign subsidiaries. If the translated financial statements are used, exchange differences will be included in the movements between the opening and closing group balance sheets. For example, an increase in inventories held by a US subsidiary from $240 to $270 during the year will be reported as an unchanged amount of £150 if the opening exchange rate of £1=$1.60 becomes £1=$1.80 by the year-end. In these circumstances an entity should take the functional currency financial statements of the foreign subsidiary as the starting point.

5.4 Non-cash transactions and transactions on deferred terms

Non-cash transactions only ever appear in a statement of cash flows as adjustments to profit or loss for the period when using the indirect method of presenting cash flows from operating activities as discussed at 4.1.2 above. Investing and financing transactions that do not involve cash or cash equivalents are always excluded from the statement of cash flows. Disclosure is required elsewhere in the financial statements in order to provide all relevant information about these investing and financing activities. *[IAS 7.43].*

Examples of such non-cash transactions include the conversion of debt to equity; acquiring assets by assuming directly related liabilities or by means of a lease; and issuing equity as consideration for the acquisition of another entity. *[IAS 7.44]*. Similarly, asset exchange transactions and the issue of bonus shares out of retained earnings are disclosed as non-cash transactions. Extract 40.9 below shows the disclosures made by China Mobile Limited.

> *Extract 40.9: China Mobile Limited (2019)*
>
> **Consolidated Statement of Cash Flows**
> for the year ended 31 December 2019 (Expressed in RMB) [extract]
> **Significant non-cash transactions**
>
> The Group recorded payables of RMB64,480 million (2018: RMB74,816 million) due to equipment suppliers as at 31 December 2019 for additions of construction in progress during the year then ended. In addition, the Group recorded lease liabilities of RMB13,219 million (2018: nil) as at 31 December 2019 for additions of right-of-use assets during the year then ended.

5.4.1 *Asset purchased on deferred terms from the supplier*

When an asset is purchased on deferred terms granted by the supplier directly, it may not be clear whether the associated cash flows should be classified under investing activities, as capital expenditure, or within financing activities, as the repayment of borrowings.

It could be argued that the payment of a deferred amount would not meet the definition of investing cash flows, because it does not result in recognition of an asset, but rather a reduction of a liability. However, as discussed above at 4, the Interpretations Committee and the IASB have affirmed in 2013 their position that in determining the classification of cash flows, the nature of the activity is still the primary principle to be considered.[16]

Accordingly, the classification of the payment comes down to a judgement as to whether its nature relates to the acquisition of an asset or the repayment of a liability. If the period between acquisition and payment is not significant, the existence of credit terms should not be interpreted as changing the nature of the cash payment from investing to financing. Therefore, the settlement of a short-term payable for the purchase of an asset is an investing cash flow. However, where the period between acquisition and payment is significant, the substance of the transaction might be that the seller is providing financing, so subsequent payments to the seller would then be included in financing cash flows. One method that may be used to determine whether the transaction involves a financing component is to look to the requirements in IFRS 15 in respect of whether a contract contains a significant financing component (see Chapter 29 at 2.5). *[IFRS 15.60-65]*.

Where an entity acquires a right-of-use asset under a lease, IAS 7 is clear that the transaction is a non-cash transaction. *[IAS 7.44]*. The cash flow presentation of leasing transactions is discussed at 5.5 below.

5.4.2 *Asset disposals on deferred terms*

The derecognition of property, plant and equipment by the lessor under a lease or another arrangement determined to be the provision of finance by the vendor would be disclosed as a non-cash transaction. Receipts to reduce the receivable from the purchaser would be investing cash flows, but appropriately described, for example as the receipt of deferred consideration rather than the proceeds on sale of property, plant and equipment. *[IAS 7.16]*.

5.4.3 Revenue contracts with deferred payment terms

As discussed in Chapter 29 at 2.5, a contract with a customer that has a significant financing component would be separated into a revenue component (for the notional cash sales price) and a loan component (for the effect of the deferred or advance payment terms). In the case of deferred payment terms this gives rise to two cash flow components i.e. the revenue component cash flows should be classified as cash flows from operating activities, and the cash flows related to the significant financing component should be classified consistently with the entity's choice to present cash flows from interests received. If the customer pays in advance, however, the sum of the cash amount and the accrued interest represent revenue, and thus there is only one cash flow component which should be classified as cash flows from operating activities.

5.5 Cash flows from leasing transactions

5.5.1 Accounting as lessee

As noted in 4.3 above, where an entity acquires a right-of-use asset under a lease, the acquisition of the asset is clearly a non-cash transaction. The requirements of IFRS 16 are covered in Chapter 23. The presentation and disclosure requirements of IFRS 16 are discussed in Chapter 23 at 5.7 and 5.8. In relation to the cash flow presentation, a lessee classifies:

(a) cash payments for the principal portion of the lease liability within financing activities;

(b) cash payments for the interest portion of the lease liability in a consistent manner to the presentation other interest paid (i.e. as operating or financing – see 4.4.1 above); and

(c) short-term lease payments, payments for leases of low-value assets and variable lease payments not included in the measurement of the lease liability within operating activities. *[IFRS 16.50]*.

IFRS 16 also requires disclosure of the total cash outflow for leases. *[IFRS 16.53(g)]*. It does not explicitly state that leases of low-value assets and short-term leases are excluded. Therefore, we believe the cash outflows related to those leases should be included in the disclosure.

A lessee would also include lease liabilities (and the related cash and non-cash movements) in the disclosures required by IAS 7.44A of changes in liabilities arising from financing activities – see 5.6 below.

However, care may be needed sometimes to distinguish a lease from a purchase of an asset based on the substance of that transaction and not its legal form. IFRS 16 applies to contracts that convey the right to use an underlying asset for a period of time and does not apply to transactions that transfer control of the underlying asset to an entity – such transactions are sales or purchases within the scope of other Standards *[IFRS 16.BC139-140]*. Consequently, if a contract grants rights that represent the in-substance purchase of an item of property, plant and equipment, such transaction may need to be presented as the purchase of the underlying asset (regardless of whether legal title transfers) either on deferred terms (see 5.4.1 above) if entered into directly with the manufacturer or dealer of the asset or together with the provision of financing if entered into with a financial institution which purchases the underlying asset on the entity's behalf from a designated supplier. In the latter case, this raises the question as to whether the payment of the supplier directly by the financial institution should be treated as a non-cash transaction or as a transaction in which the financial institution is acting as a paying agent for the entity. In this case the entity would report an investing cash outflow to the supplier and a financing cash inflow from the financial institution upon taking control of the underlying asset and subsequent financing cash outflows when the liability is settled in future periods.

5.5.2 Payments made by the lessee before commencement date

Where a lessee makes a lease payment at or before the commencement date, this payment is included in the initial measurement of the right-of-use asset. The nature of this cash outflow is consideration for the acquisition of the right-of-use asset and should therefore be classified as an investing activity.

5.5.3 Lease incentives

Lease incentives are defined in IFRS 16 as 'payments made by a lessor to a lessee associated with a lease, or the reimbursement or assumption by a lessor of costs of a lessee' and are dealt with in Chapter 23 at 4.5.2. *[IFRS 16 Appendix A].*

Neither IFRS 16 nor IAS 7 provide specific guidance on the presentation of the cash inflows from lease incentives. It is however clear that IAS 7 considers a lease transaction to be essentially the provision of finance by the lessor to the lessee. *[IAS 7.17(e)].* IFRS 16 defines lease payments as 'Payments made by a lessee to a lessor relating to the right to use an underlying asset during the lease term ... less any lease incentives'. *[IFRS 16 Appendix A].* Considering this definition of lease payments in the context of IAS 7, in our view the most appropriate presentation of cash flows from lease incentives would be therefore to treat such incentives as part of financing activities in the statement of cash flows, regardless of whether they are received after the commencement date of the lease and are deducted from the lease liability or before the lease commencement date.

As with any judgements made as to the classification and disclosure of cash flows, additional disclosure may be necessary to ensure transparency of the treatment adopted.

5.5.4 Sale and leaseback transactions

A sale and leaseback transaction involves the transfer of an asset by an entity (the seller-lessee) to another entity (the buyer-lessor) and the leaseback of the same asset by the seller-lessee. Sale and leaseback transactions are discussed further in Chapter 23 at 8.

In terms of presentation in the statement of cash flows, IFRS 16 refers only to leases, requiring the cash payments for the principal portion of the lease liability to be presented in financing activities and cash payments for the interest portion to be presented in accordance with IAS 7. *[IFRS 16.50].* Nothing is included in IFRS 16 or IAS 7 with respect to cash flow presentation in the case of a sale and lease-back transaction.

Presentation of the cash flows relating to the sale and leaseback transaction for a seller-lessee will depend on how the transaction is accounted for under IFRS 16, specifically whether the transfer of the asset is accounted for as a sale of the asset in accordance with the requirements of IFRS 15. *[IFRS 16.99]*.

If the transaction does satisfy the requirements of IFRS 15 to be accounted for as a sale, the cash received comprises an amount reflecting the fair value of the underlying asset plus the amount of any additional financing provided by the buyer-lessor to the seller-lessee. *[IFRS 16.101]*. This should be reflected in the statements of cash flows by splitting the proceeds between investing cash flows and financing cash flows. However, there are different approaches as to how this split could be determined. From an economic standpoint, the seller-lessee has sold only its interest in the value of the underlying asset at the end of the leaseback – it has retained its right to use the asset for the duration of the leaseback. *[IFRS 16.BC266]*. Therefore, in our view, the amount that should be shown as an investing cash inflow is the amount of the sale proceeds that reflects the proportion of the fair value of the underlying asset that is not retained by the seller-lessee. Any excess should be presented as part of cash flows from financing activities. This presentation in the statement of cash flows is consistent with the requirement in IFRS 16 to recognise only the amount of any gain or loss on the sale and leaseback relating to the rights that have been transferred to the buyer-lessor and also to measure the right-of-use asset as a proportion of the previous carrying amount of the underlying asset. *[IFRS 16.100]*. This can be seen in Example 40.2 below, which is based on Example 23.35 in Chapter 23.

If the transaction does not satisfy the requirements of IFRS 15 to be accounted for as a sale, the cash received is classified in the cash flow statement as a cash inflow from financing activities because the substance of the transaction is that the lessee has raised finance, with the asset provided as security. The resulting financial liability is accounted for under IFRS 9, *[IFRS 16.103]*, and the seller-lessee splits the cash outflows between repayment of the principal and payment of interest. Repayments of the principal are classified as financing cash flows, whereas interest should be presented in a manner consistent with the presentation of other interest paid in statement of cash flows (see 4.4.1 above).

Example 40.2: Sale and leaseback transaction: presentation of cash flows

An entity (Seller-lessee) sells a building to another entity (Buyer-lessor) for cash of CU2,000,000. Immediately before the transaction, the building is carried at a cost of CU1,000,000. At the same time, Seller-lessee enters into a contract with Buyer-lessor for the right to use the building for 18 years, with annual payments of CU120,000 payable at the end of each year. The terms and conditions of the transaction are such that the transfer of the building by Seller-lessee satisfies the requirements for determining when a performance obligation is satisfied in IFRS 15. Accordingly, Seller-lessee and Buyer-lessor account for the transaction as a sale and leaseback. This example ignores any initial direct costs.

The fair value of the building at the date of sale is CU1,800,000.

At the commencement date, Seller-lessee measures the right-of-use asset arising from the leaseback of the building at the proportion of the previous carrying amount of the building that relates to the right-of-use retained by Seller-lessee, which is CU699,555. This is calculated as: CU1,000,000 (the carrying amount of the building) ÷ CU1,800,000 (the fair value of the building) × CU1,259,200 (the discounted lease payments for the 18-year right-of-use asset) and represents 70% of the building's cost.

Seller-lessee has sold only 30% of the underlying asset as it has retained the use of 70% of the asset via the leaseback transaction. In its statement of cash flows Seller-lessee presents investing cash inflows of CU540,000 representing 30% of the fair value of the building (i.e. 30% × £1,800,000) and the remaining CU1,460,000 (i.e. CU2,000,000 – CU540,000) as financing cash flows.

An alternative approach in this example, could be to treat only the excess of any sale proceeds above the fair value of the underlying asset of CU200,000 (i.e. CU2,000,000 – CU1,800,000) as financing cash flows with CU1,800,000 presented within investing activities.

5.5.5 Accounting as lessor

For lessors, IFRS 16 is silent on the presentation of cash flows arising from their leasing activities. However, since lessor accounting under IFRS 16 is substantially unchanged from the accounting under the predecessor standard, IAS 17 – *Leases*, in practice the presentation of cash flows for lessors should be established and well understood. In summary, the cash inflows from operating leases will form part of the cash flows from operating activities, whether through use the direct or indirect method. The cash inflows from finance leases will follow the treatment set out above at 5.4.2 in relation to assets disposed of on deferred terms.

5.6 Changes in liabilities arising from financing activities

In January 2016, the IASB amended IAS 7 to require disclosures that enable users of financial statements to evaluate changes in liabilities arising from financing activities, including both changes arising from cash flows and non-cash changes. *[IAS 7.44A]*. This amendment was in response to feedback from users, who highlighted that understanding an entity's cash flows is critical to their analysis and that there is a need for improved disclosures about an entity's debt, including changes in debt during the reporting period. *[IAS 7.BC9]*. Liabilities arising from financing activities are liabilities for which cash flows were, or future cash flows will be, classified in the statement of cash flows as cash flows from financing activities (see 4.3 above). In addition, financial asset related cash flows which will be included in cash flows from financing activities (such as assets that hedge liabilities arising from financing activities), should also be included in the scope of this disclosure. *[IAS 7.44C]*.

The following changes should be disclosed to explain the movements in these instruments:

(a) changes from financing cash flows;

(b) changes arising from obtaining or losing control of subsidiaries or other businesses;

(c) the effect of changes in foreign exchange rates;

(d) changes in fair values; and

(e) other changes. *[IAS 7.44B]*.

The standard suggests that these disclosures could be presented in the form of a reconciliation of the opening and closing balances in the statement of financial position for liabilities arising from financing activities. Where such a reconciliation is presented, sufficient information should be provided to enable the link of items included in the reconciliation to the statement of financial position and the statement of cash flows. *[IAS 7.44D]*. If an entity provides the disclosure required by paragraph 44A in combination with disclosures of changes in other assets and liabilities, it should disclose the changes in liabilities arising from financing activities separately from changes in those other assets and liabilities. *[IAS 7.44E]*.

The Interpretations Committee provided further interpretation of these requirements in June 2019.[17] In providing the disclosures required by paragraph 44A of IAS 7. the Interpretations Committee noted that the requirements of IAS 1 on aggregation and disaggregation would apply (see Chapter 3 at 4.1.5). Therefore, an entity should disclose any individually material liability (or asset) and any material reconciling item (i.e. cash or non-cash changes) separately in the reconciliation. An entity should also consider whether additional explanation is needed in order to enable users of financial statements to evaluate changes in liabilities arising from financing activities. The disclosures should be structured and disaggregated appropriately to ensure that they:

- provide information about the entity's sources of finance;
- enables investors to check their understanding of the entity's cash flows; and
- enables investors to link items to the statement of financial position and the statement of cash flows, or related notes.

Example 40.3 below illustrates how an entity might satisfy the requirement to reconcile liabilities arising from financing activities. The cash flows shown in the example should reconcile to the net of the financing cash inflows and outflows in the statement of cash flows.

Example 40.3: Reconciliation of liabilities arising from financing activities

	20X1	Cash flows	Non-cash changes			20X2
			Acquisition	New leases	Exchange differences	
Bank loans	1,040	250	200	–	25	1,515
Lease liabilities	–	(90)	–	900	10	820
Financing liabilities	1,040	160	200	900	35	2,335

In Extract 40.10 below, Inspired Energy also presents the disclosure in a tabular format, but with the categories of liabilities across the top of the table, which is equally acceptable.

Extract 40.10: Inspired Energy PLC (2018)

At 31 December 2018	**22,602**	2,838	25,440

5.7 Voluntary disclosures

IAS 7 encourages the disclosure of additional cash flow related information that may help users better understand the financial position of the entity, including a commentary by management, as follows:

(a) the amount of undrawn borrowing facilities that may be available for future operating activities and to settle capital commitments, indicating any restrictions on the use of these facilities;

(b) the aggregate amount of cash flows that represent increases in operating capacity separately from those cash flows that are required to maintain operating capacity (see 5.8.1 below); and

(c) the amount of the cash flows arising from the operating, investing and financing activities of each reportable segment (as defined in IFRS 8 – *Operating Segments*) (see 5.8.2 below). *[IAS 7.50]*.

5.7.1 *Cash flows to increase and maintain operating capacity*

IAS 7 does not contain any guidance as to how to distinguish cash flows for expansion from cash flows for maintenance in relation to the voluntary disclosure referred to under (b) above. The standard merely states that this information is useful in helping the user to determine whether the entity is investing adequately in the maintenance of its operating capacity or whether it may be sacrificing future profitability for the sake of current liquidity and distributions to owners. *[IAS 7.51]*.

Hongkong Land Holdings distinguishes renovations expenditure from developments capital expenditure in its analysis of investing cash flows.

Extract 40.11: Hongkong Land Holdings Limited (2019)

Consolidated Cash Flow Statement [extract]

for the year ended 31st December 2019

	Note	**2019** **US$m**	2018 US$m
Investing activities			
Major renovations expenditure		**(116.4)**	(93.0)

Proceeds on disposal of other investments		**157.5**	–
Cash flows from investing activities		**(658.0)**	(1,055.9)

5.7.2 *Segment cash flow disclosures*

Disclosure of segmental cash flows is encouraged because it reveals the availability and variability of cash flows in each segment and allows users to better understand the relationship between the cash flows of the business as a whole and those of its component parts. *[IAS 7.52]*.

IAS 7 contains an example of the segmental disclosure advocated at 5.7 above. *[IAS 7 Appendix A part D]*. However, this example simply reports the operating, investing and financing cash flows of its two segments with no reconciliation of the total to the statement of cash flows. In practice it might be difficult to allocate financing cash flows across the entity's reportable segments, given that this is not how treasury functions tend to operate.

A.P. Møller – Mærsk provided an analysis of operating cash flows and capital expenditure (part of its investing cash flows) by reportable segment. The entity did not disclose financing cash flows by reportable segment (comparative information is provided in the financial statements but is not reproduced here).

Extract 40.12: A.P. Møller – Mærsk A/S (2017)

Note 1 Segment information [extract]

	Maersk Line	APM Terminals	Damco	Svitzer	Maersk Container Industry	Total reportable segments

Cash flow used for capital expenditure	–6,142	–672	–4	–96	–20	–6,934

6 ADDITIONAL IAS 7 CONSIDERATIONS FOR GROUPS

IAS 7 does not distinguish between single entities and groups, and there are no specific requirements as to how an entity should prepare a consolidated statement of cash flows. In the absence of specific requirements, cash inflows and outflows would be treated in the same way as income and expenses under IFRS 10 – *Consolidated Financial Statements*. Applying these principles, the statement of cash flows presented in consolidated financial statements should reflect only the flows of cash and cash equivalents into and out of the group, i.e. consolidated cash flows are presented as those of a single economic entity. *[IFRS 10 Appendix A]*. On the same basis, the cash flows of a consolidated subsidiary should be included in the consolidated statement of cash flows for the same period as its results are reported in the consolidated statement of comprehensive income, i.e. from the date the group gains control until the date it loses control. *[IFRS 10.B88]*.

Cash flows that are internal to the group (such as payments and receipts for intra-group sales, management charges, dividends, interest and financing arrangements) should be eliminated. *[IFRS 10.B86]*. However, transactions with non-controlling interests as well as with associates, joint ventures and unconsolidated subsidiaries would not be eliminated and are discussed in greater detail below.

6.1 Preparing a consolidated statement of cash flows

In principle, the group statement of cash flows should be built up from those prepared by individual subsidiaries with intra-group cash flows being eliminated as part of the aggregation process. This would generally be the case for entities presenting operating cash flows under the direct method, where information on gross cash receipts and payments has been obtained from each group entity's accounting records.

In practice, however, it may be possible to prepare a statement of cash flows at a more consolidated level, by starting with the disclosures in the consolidated statement of comprehensive income and statement of financial position and then applying the adjustments reflected as part of the financial statements consolidation process, together with information provided on external cash flows by individual subsidiaries. Thus, an entity adopting the direct method could use this information to derive the value of the major classes of gross cash receipts and gross cash payments. *[IAS 7.19]*. An entity presenting operating cash flows under the indirect method would use this information to calculate the values for movements in inventories, operating receivables and payables and other non-cash items that appear in the reconciliation of consolidated profit or loss to the group's cash flow from operating activities. *[IAS 7.20]*. As noted at 5.3.2.D above, groups with foreign subsidiaries will need to take extra care when using this method to ensure exchange differences are treated appropriately.

Cash flows from investing and financing activities could similarly be derived from a reconciliation of the relevant headings in the consolidated statement of comprehensive income to statement of financial position movements. However, for this to be possible, subsidiaries would have to provide supplementary information (as part of internal group reporting) to prevent gross cash flows from being netted off and to ensure that the cash flows are shown under the correct classifications. In particular, detailed information about receivables and payables would be essential to ensure that the movements in operating, investing and financing receivables and payables are identified.

6.2 Transactions with non-controlling interests

Dividends paid to non-controlling interest holders in subsidiaries are included under cash flows from financing activities or operating activities, in accordance with the entity's determined policy for dividends paid (see 4.4.1 above).

IFRS 10 requires entities to distinguish between transactions that give rise to a change in control and those that do not, because a transaction when there is no change in control is effectively one with the owners in their capacity as owners. *[IFRS 10.BCZ168]*. Changes in ownership interests in a subsidiary that do not result in a loss of control are therefore accounted for as equity transactions, and the resulting cash flows are classified in the same way as other transactions with owners. *[IAS 7.42B]*. Accordingly, IAS 7 requires that cash flows arising from changes in ownership interests in a subsidiary that occur after control is obtained, but do not give rise to a loss of control are classified as cash flows from financing activities. *[IAS 7.42A]*.

6.3 Acquisitions and disposals

An entity should present separately within investing activities the aggregate cash flows arising from obtaining or losing control of subsidiaries or other businesses. *[IAS 7.39]*. For transactions that involve obtaining or losing control of subsidiaries or other businesses during the period, disclosure is also required, in aggregate, of each of the following:

(a) the total consideration paid or received;

(b) the portion of the consideration consisting of cash and cash equivalents;

(c) the amount of cash and cash equivalents in the subsidiaries or other businesses over which control is obtained or lost; and

(d) the amount of the assets and liabilities, other than cash or cash equivalents, in the subsidiaries or other businesses over which control is obtained or lost, summarised by each major category. *[IAS 7.40]*.

Cash flows arising from changes in ownership interests in a subsidiary that do not result in a loss of control are classified as financing cash flows (see 6.2 above). *[IAS 7.42A]*.

The aggregate amount of cash paid or received as consideration is reported in the statement of cash flows net of cash and cash equivalents acquired or disposed of. *[IAS 7.42]*. The cash flow effects of losing control are not deducted from those of gaining control. *[IAS 7.41]*. This implies that entities should present one analysis for all acquisitions and another for all disposals, such as that presented by Naspers, shown in Extract 40.13 below.

6.3.1 *Acquisition-related costs*

IFRS 3 – *Business Combinations* – requires acquisition-related costs (other than those costs relating to the issue of equity or debt securities) to be recognised as an expense in the period in which the costs are incurred and the services are received. *[IFRS 3.53]*. As discussed at 4.2 above, the definition of investing activities in IAS 7, states that 'only expenditures that result in a recognised asset in the statement of financial position' give rise to investing cash flows. *[IAS 7.16]*. As a result, cash flows relating to acquisition costs recognised as an expense would have to be classified within operating activities. This faithfully reflects the fact that these payments are for services received.

6.3.2 Deferred and other non-cash consideration

Not all acquisitions or disposals of businesses are satisfied in full by the exchange of cash. Any non-cash consideration, such as shares issued by either party or amounts to be paid or received by the entity at a later date, is not included in the amount presented under investing activities. *[IAS 7.43]*. Instead, the non-cash element of the acquisition or disposal is disclosed. As explained in more detail at 5.4 above, the purchase of assets on deferred terms can be a complicated area because it may not be clear whether the associated cash flows should be classified under investing activities, as capital expenditure, or within financing activities, as the repayment of borrowings. Hence judgement is required when determining the appropriate classification of the deferred payment in the statement of cash flows. These same principles apply on the acquisition of a business involving deferred consideration.

6.3.3 Contingent consideration

6.3.3.A Business combinations

When a business combination agreement allows for adjustments to the cost of the combination that are contingent on one or more future events, IFRS 3 requires the acquirer to recognise the acquisition-date fair value of the contingent consideration, *[IFRS 3.39]*, and classify an obligation to pay the contingent consideration as a liability or as equity in accordance with the provisions of IAS 32. *[IFRS 3.40]*. Changes resulting from events after the acquisition date, such as meeting a performance target, are not reflected by adjusting the recorded cost of the business combination. Instead, any payment or receipt in excess of the carrying amount of the related liability or asset is recognised in profit or loss. *[IFRS 3.58]*.

The primary principle for the classification of cash flows should be the nature of the activity giving rise to the cash flow, according to the definitions of operating, investing and financing activities in the Standard. This might imply that all payments relating to a business combination should be classified as investing cash flows. However, as discussed at 4.2 above, the Board added a requirement in IAS 7 that only expenditures that result in a recognised asset are eligible for classification as investing activities. *[IAS 7.16]*.

Accordingly, cash payments up to the amount recognised for the acquisition-date fair value of the contingent consideration (and thereby included in the carrying value of the acquired assets including goodwill) would be classified in investing activities. Since contingent consideration generally arises for reasons other than the provision of finance to the acquirer, any resulting payments would generally not seem to be eligible for classification as financing cash flows. As a result, any contingent consideration in excess of the amount that was recorded on the acquisition date, flows would need to be presented as operating cash flows by default.

6.3.3.B Asset acquisitions outside of business combinations

The purchase price of intangible assets or tangible assets acquired outside of a business combination commonly includes contingent consideration for example to resolve an uncertainty or a difference in views about the initial value of the asset transferred.

Accounting for the contingent consideration element of such asset purchases is discussed in Chapter 17 at 4.5 for intangible assets, and Chapter 18 at 4.1.9 for tangible assets. As explained in those chapters, such transactions are often very complex and payment can be dependent on a number of factors, with no specific guidance provided in IAS 38 – *Intangible Assets* – or IAS 16. Therefore, an entity should develop and consistently apply an accounting policy for the initial and subsequent measurement of such assets that results in information that is relevant and reliable in its particular circumstances.

Once such an accounting policy is developed, the presentation in the statement of cash flows should follow the accounting treatment adopted in the statement of financial position.

As discussed at 4.2 above, even though the reason for the cash flows in a genuine contingent consideration is to acquire a long-term asset, classifying the resulting cash flows as investing would only be appropriate if the cash flows are in settlement of an expenditure that results in a recognised asset in the statement of financial position. *[IAS 7.16]*. In other words, the IASB effectively required the classification of cash flows from investing activities in the statement of cash flows to be aligned with the presentation of recognised assets in the statement of financial position rather than to reflect an entity's judgment as to the most appropriate classification based the entity's business and the definitions of investing activities *[IAS 7.BC5-7]*.

Since contingent consideration generally arises for reasons other than the provision of finance to the purchaser, any resulting payments would generally not seem to be eligible for classification as financing cash flows. Therefore, payments not classified as investing cash flows would need to be presented as operating cash flows by default.

6.3.3.C Contingent consideration received on disposals

When an entity disposes of a subsidiary, it presents the cash flows separately within investing activities. This will be the case even for the receipt of contingent consideration because the cash inflow is still an investing cash flow being the receipt from the sale of equity or debt instruments of another entity (see 4.2 above).

6.3.4 Settlement of amounts owed by the acquired entity

A question that sometimes arises is how to treat a payment made by the acquirer to settle amounts owed by a new subsidiary, either to take over a loan that is owed to the vendor by that subsidiary or to extinguish an external borrowing.

Payments made to acquire debt instruments of other entities are normally included under investing activities. *[IAS 7.16]*. Therefore, a payment to the vendor to take over a loan that is owed to the vendor by the subsidiary is classified under the same cash flow heading irrespective of whether it is regarded as being part of the purchase consideration or the acquisition of a debt.

Payments made by the acquirer to the vendor before acquisition to extinguish an external borrowing of the subsidiary would similarly be classified as investing cash flows. This presentation can be contrasted with the repayment of an external borrowing by the new subsidiary after acquisition, using funds provided by the parent, which is a cash outflow from financing activities. *[IAS 7.17]*.

6.3.5 Settlement of intra-group balances on a demerger

A similarly fine distinction might apply on the demerger of subsidiaries. These sometimes involve the repayment of intra-group indebtedness out of the proceeds from external finance raised by the demerged subsidiary. If the external funding is raised immediately prior to the subsidiary leaving the group, it is strictly a financing inflow in the consolidated statement of cash flows, being cash proceeds from issuing short or long-term borrowings. *[IAS 7.17]*. If the subsidiary both raises the external funding and repays the intra-group debt after the demerger, the inflow is shown in the consolidated statement of cash flows under investing activities, being a cash receipt from the repayment of advances and loans made to other parties. *[IAS 7.16]*.

6.4 Cash flows of associates, joint operations and investment entities

6.4.1 Investments in associates and joint ventures

Changes in cash and cash equivalents relating to associates or joint ventures accounted for under the equity or cost method will impact the entity's statement of cash flows only to the extent of the cash flows between the group and the investee. *[IAS 7.37]*. The same concept would apply to associates or joint ventures carried at fair value as allowed by IAS 28 – *Investments in Associates and Joint Ventures* (discussed in Chapter 11). Examples include cash dividends received and loans advanced or repaid. *[IAS 7.37]*. Cash flows in respect of an entity's investment in an equity accounted associate or joint venture would also be presented. *[IAS 7.38]*.

Cash dividends received from equity accounted associates and joint ventures would be classified as operating or investing activities in accordance with the entity's determined policy for other dividends received (see 4.4.1 above). Where the net cash inflow from operating activities is determined using the indirect method, the group's share of profits or losses from equity-accounted investments will appear as a non-cash reconciling item in the cash flow statement (see 4.1.2 above).

The cash flows arising on the acquisition and disposal of an associate or joint venture would be classified as investing activities. In addition, the considerations set out at 6.3.2 and 6.3.3 above in respect of deferred and contingent consideration on acquisition and disposal of a subsidiary should also be applied when determining the appropriate classifications of cash flows relating to the acquisition and disposal of associates and joint ventures.

6.4.2 Cash flows of joint operations

IAS 7 does not specifically deal with the treatment of the cash flows of joint operations. However, following the guidance of IFRS 11 – *Joint Arrangements* – all transactions should be reflected in the accounts of the joint operator's financial results to the extent of its interests in those transactions. *[IFRS 11.20]*. Therefore, the cash flows of the joint arrangement are already included in the operator's financial statements and no additional adjustments are required to reflect the activities of the joint operation.

The treatment of cash flows for the acquisition and disposal of a joint operation is less clear as there is an argument for presentation either as a single net cash flow in investing activities (as is required for the cost of a business combination, discussed at 6.3 above); or as separate cash flows, classified according to the nature of the underlying assets and liabilities acquired. IFRS 11 requires an entity to determine whether the activity undertaken by a joint operation constitutes a business as defined in IFRS 3 and to apply business combination or asset acquisition accounting in accordance with that analysis. *[IFRS 11.21A]*. Therefore it would be appropriate to apply a similar approach to the presentation of the cash flows, with acquisitions and disposals of operations meeting the definition of a business giving rise to a single investing cash flow, and acquisitions and disposals of operations not regarded as a business giving rise to cash flows according to the nature of the assets and liabilities acquired or disposed.

6.4.3 Cash flows in investment entities

IAS 7 does not address the treatment of subsidiaries held at fair value in an investment entity. As these investments are accounted for at fair value through profit or loss in accordance with IFRS 9, the related cash flows would be treated consistently with cash flows from joint ventures and associates discussed at 6.4.1 above.

The disclosures required by an investment entity on the acquisition of subsidiaries are less than those required for other entities. Investment entities need only disclose the total consideration paid or received and the portion of the consideration consisting of cash and cash equivalents are required to be disclosed. *[IAS 7.40-40A]*.

6.5 Cash flows in separate financial statements

6.5.1 Cash flows of subsidiaries, associates and joint ventures

IAS 7 addresses the treatment of cash flows of associates, joint ventures and subsidiaries accounted for by use of the cost method, restricting its reporting in the statement of cash flows to the cash flows between investor and the investee, for example, to dividends and advances as discussed in 6.4.1 above. *[IAS 7.37]*. This treatment would also be applied to associates, joint ventures and subsidiaries either held at fair value through profit or loss, or using the equity accounted method in the separate financial statements, as allowed by IAS 27 – *Separate Financial Statements* – and discussed in Chapter 8 at 2.

6.5.2 Group cash pooling and cash sharing arrangements

Many groups use some form of cash pooling or cash sharing arrangement to manage the group's cash position on a consolidated basis, effectively concentrating the group's cash in one place. Such arrangements seek to maximise the return for the group as a whole on their cash, minimise the cost of funding and give visibility to the group's cash and currency position.

The terms and conditions of such arrangements vary, and it is important to understand the specific nature of the pooling or sharing arrangement in place in order to determine the appropriate accounting treatment.

At 6.5.3 and 6.5.4 below we discuss three of the most common types of arrangements.

6.5.3 Group treasury arrangements

Some groups adopt treasury arrangements under which cash resources are held centrally, either by the parent company or by a designated subsidiary company. Any excess cash is transferred to the central bank account which is in the name of the designated 'treasury entity'. In some cases, a subsidiary might not even have its own bank account, with all receipts and payments being made directly from the centrally controlled funds. Instead of presenting cash and bank deposits at each period end, the subsidiary should record an intercompany receivable for the amounts that have been transferred to the treasury entity. In extremely rare cases the intercompany balance may meet the definition of cash equivalents and be regarded as a short-term highly liquid investment that is readily convertible into known amounts of cash and are subject to insignificant risk of changes in value. However, in most cases such funds are transferred to the designated group entity for an indeterminate term and the subsidiary would not be able to withdraw on demand the amounts deposited without prior authorisation.

A further question that arises is whether or not a statement of cash flows should be presented when preparing the separate financial statements of the subsidiary given that there is no cash or cash equivalents balance held at each period end and, for some entities, at any time during the year. In our view, the preparation of the statement of cash flows should be based upon the actual cash flows during the period regardless of cash and cash equivalents balance held directly by the entity.

Where no cash flows through an entity, but rather all transactions flow through another group company acting on behalf of the entity, the entity should still record receipts from debtors and payments to suppliers, albeit with an associated deposit to or withdrawal from a balance with another group company. Just as a bank processes payments and receipts as agent for the account holder, so the group treasury function acts as agent for the entity, and these transactions should be reflected in a statement of cash flows. This approach is consistent with the requirements in IAS 7 that all entities should prepare a statement of cash flows which forms an integral part of the financial statements. *[IAS 7.1]*.

Where the subsidiary makes net deposits of funds to, or net withdrawals of funds from the designated group entity during the reporting period, a further question arises as to how movements should be presented in the subsidiary's statement of cash flows. As explained above, these transactions normally give rise to intercompany balances. Therefore, the deposits or withdrawals should be evaluated against the definitions of the categories of cash flows and presented as either operating activities or alternatively as investing or financing activities, as appropriate. Further consideration should be made as to whether these cash flows meet the criteria for net presentation as discussed at 5.2 above.

6.5.4 Cash pooling

Groups often use what are commonly known as cash pooling arrangements. Typically, these will involve a number of subsidiaries within a group each having a legally separate bank account with the same bank, but these accounts are managed, with the agreement of the bank, on a consolidated basis. For example, interest will normally be determined on a notional basis using the net balance of all accounts; similarly, any overdraft limit will normally apply to the net balance. Typical characteristics of notional cash pooling and physical cash pooling are discussed below however arrangements vary. Therefore, terms and conditions of each arrangement should be reviewed carefully to ensure that the accounting treatment adopted is appropriate for that specific arrangement.

6.5.4.A Notional cash pooling

Notional cash pooling arrangements allow the group to net off the balances of different accounts across jurisdictions, without physically moving the cash to a header or master account, but with each individual entity continuing to have access to the cash it has deposited in its individual account, sometimes called a 'memo' or 'mirror' account. This is, in essence, an interest rate adjustment, and the ownership of the cash does not change.

In such cases, therefore, each entity will continue to report their cash as 'cash and cash equivalents'.

6.5.4.B Physical cash pooling

Typically, in these arrangements, which are also known as zero balancing, cash concentration or physical cash sweeping, the group physically sweeps excess cash out of the individual bank accounts to a header account on a daily basis. In these arrangements, the ownership of the cash changes: the relationship moves from a deposit with a third-party bank to a loan to the group entity that is the cash pool header. As in the group treasury arrangements discussed above, the individual companies will need to consider how to present these balances at the period end.

When amounts from the individual bank accounts that have been pooled can be withdrawn upon demand by the individual companies without prior authorization or delay, presentation as cash and cash equivalents may be appropriate. In other circumstances, the balances may need to be presented as short-term intercompany receivables with appropriate disclosures about the terms of the cash-pooling arrangement.

The presentation of cash balances in cash pooling arrangements in the group accounts, in particular whether the individual balances should be presented net or gross, is discussed in Chapter 54 at 7.4.1.E.

7 ADDITIONAL IAS 7 CONSIDERATIONS FOR FINANCIAL INSTITUTIONS

IAS 7 applies to banks, insurance entities and other financial institutions. Nevertheless, there are some differences in its application as compared to entities that are not financial institutions. For example, in considering the components of cash and cash equivalents, banks would not usually have borrowings with the characteristics of an overdraft, and cash for their purposes should normally include cash and balances at central banks, together with loans and advances to other banks repayable on demand. Allianz discloses such items as components of its cash and cash equivalents, as shown in Extract 40.14 below.

Extract 40.14: Allianz SE (2019)

CONSOLIDATED STATEMENTS OF CASH FLOWS [extract]

Cash and cash equivalents

€ mn

As of 31 December	2019	2018
Balances with banks payable on demand	8,245	7,660
Balances with central banks	3,215	2,990
Cash on hand	64	57
Treasury bills, discounted treasury notes, similar treasury securities, bills of exchange and checks	6,952	6,526
Reverse repurchase agreements (due in three months or less)	2,598	–
Total	**21,075**	**17,234**

IAS 7 contains a number of additional provisions affecting the preparation of statements of cash flow by financial institutions. These are covered in broad outline below.

7.1 Operating cash flows

Cash advances and loans made by financial institutions are usually classified as operating activities (and not as investing activities, as they are for other entities) since they relate to a financial institution's main revenue-producing activity. *[IAS 7.15, 16(e)]*. Similarly, receipts from the repayment of loans and advances would be included in operating cash flows. *[IAS 7.16(f)]*.

Interest paid and interest and dividends received are usually classified as operating cash flows for a financial institution. *[IAS 7.33]*.

For an insurance entity, cash receipts and cash payments for premiums and claims, annuities and other policy benefits would be included in its operating cash flows as these relate to the principal activities of the entity.

Under the direct method of reporting operating cash flows, a financial institution that does not obtain information from its accounting records can derive the disclosures for major classes of gross cash receipts and payments by adjusting interest and similar income and interest expense and similar charges and other items recognised in profit or loss for:

(a) changes during the period in operating receivables and payables;

(b) other non-cash items; and

(c) other items for which the cash effects are investing or financing cash flows. *[IAS 7.19]*.

Where an insurance entity presents its operating cash flows using the direct method, it should separately disclose cash flows arising from insurance contracts. *[IFRS 4.37(b)]*. Comparative information is required. *[IFRS 4.42]*. When an entity adopts IFRS 17, which is effective from 1 January 2023 (see Chapter 56), the specific disclosure requirements under IFRS 4 – *Insurance Contracts* – will no longer apply.

Subject to the differences noted above, the principles for a financial institution presenting operating cash flows under the indirect method are the same as those discussed at 4.1.2 above for other entities.

7.2 Reporting cash flows on a net basis

Cash flows from each of the following activities of a financial institution may be reported on a net basis:

(a) cash receipts and payments for the acceptance and repayment of deposits with a fixed maturity date;

(b) the placement of deposits with and withdrawal of deposits from other financial institutions; and

(c) cash advances and loans made to customers and the repayment of those advances and loans. *[IAS 7.24]*.

8 REQUIREMENTS OF OTHER STANDARDS

8.1 Cash flows of discontinued operations

IFRS 5 – *Non-current Assets Held for Sale and Discontinued Operations* – requires an entity to disclose the net cash flows attributable to the operating, investing and financing activities of discontinued operations. These disclosures can be presented either on the face of the statement of cash flows or in the notes. Disclosure is not required for disposal groups that are newly acquired subsidiaries which are classified as held for sale on acquisition in accordance with IFRS 5. *[IFRS 5.33(c)]*. The general presentation requirements of IFRS 5 are dealt with in Chapter 4.

In the example below, Netcare Limited elected to show the cash flows of discontinued operations on the face of the statement of cash flows, as well as in the note. Over and above this, the entity has elected to include additional disclosures by splitting cash flows in respect of interest and tax paid into those relating to continuing and discontinued operations. In the notes to the financial statements, Netcare Limited further analyses these cash flows by separate major business line.

Extract 40.15: Netcare Limited (2012)

GROUP STATEMENT OF CASH FLOWS [extract]
for the year ended 30 September

Rm	2012	2011
Cash generated from operations	5 193	5 572
Interest paid	(1 976)	(1 836)
Continuing operations	(1 959)	(1 817)
Discontinued operations	(17)	(19)
Taxation paid	(740)	(674)
Continuing operations	(720)	(658)
Discontinued operations	(20)	(16)
Capital reductions paid		(83)
Ordinary dividends paid	(694)	(553)
Ordinary dividends paid by subsidiaries	(4)	(3)
Preference dividends paid	(46)	(47)
Distributions to beneficiaries of the HPFL trusts	(43)	(47)
Net cash from operating activities	1 690	2 329
Continuing operations	1 646	2 285
Discontinued operations	44	44

NOTES TO THE GROUP ANNUAL FINANCIAL STATEMENTS [extract]
12.1 Discontinued operations [extract]

Rm	**Care**	**Transform**	**Total**
2012			
Cash flows from operating activities	**17**	**27**	**44**
Cash flows from investing activities	**(3)**	**(7)**	**(10)**
2011			
Cash flows from operating activities	39	5	44
Cash flows from investing activities	(3)	(8)	(11)
Cash flows from financing activities	(14)	3	(11)

8.2 Cash flows arising from insurance contracts

IFRS 4 requires that where an insurance entity presents its operating cash flows using the direct method, it should separately disclose cash flows arising from insurance contracts. *[IFRS 4.37(b)]*. Comparative information is required. *[IFRS 4.42]*. When an entity adopts IFRS 17 the specific disclosure requirements under IFRS 4 will no longer apply (see 7.1 above).

8.3 Cash flows arising from the exploration of mineral resources

In a similar vein, IFRS 6 – *Exploration for and Evaluation of Mineral Resources* – requires that an entity discloses the amounts of operating and investing cash flows arising from the exploration for and evaluation of mineral resources. *[IFRS 6.24(b)]*. The requirements of IFRS 6 are discussed in Chapter 43. The requirement for investing cash flows to give rise to the recognition of an asset, discussed at 4.2 above, is particularly relevant to entities applying IFRS 6.

8.4 Cash flows arising from interests in subsidiaries, joint ventures and associates

IFRS 12 requires an entity to disclose in its consolidated financial statements summarised financial information about the cash flows for each subsidiary that has non-controlling interests that are material to the entity. *[IFRS 12.B10(b)]*. These amounts are stated before inter-company eliminations. *[IFRS 12.B11]*.

For each material joint venture and associate an entity is also required to disclose dividends received from the joint venture or associate *[IFRS 12.B12(a)]* and, for joint ventures, the amount of cash and cash equivalents. *[IFRS 12.B13(a)]*. In addition, the standard requires disclosure of any significant restrictions on the ability of joint ventures or associates to transfer funds to the entity in the form of cash dividends, or to repay loans or advances made by the entity. *[IFRS 12.22(a)]*.

IFRS 12 is discussed in more detail in Chapter 13.

Chapter 41 Interim financial reporting

1 INTRODUCTION 3195
- 1.1 Definitions 3196

2 OBJECTIVE AND SCOPE OF IAS 34 3196
- 2.1 Objective 3196
- 2.2 Scope 3197

3 COMPONENTS, FORM AND CONTENT OF AN INTERIM FINANCIAL REPORT UNDER IAS 34 3198
- 3.1 Complete set of interim financial statements 3198
- 3.2 Condensed interim financial statements 3199
- 3.3 Requirements for both complete and condensed interim financial information 3203
- 3.4 Management commentary 3203

4 DISCLOSURES IN CONDENSED FINANCIAL STATEMENTS 3204
- 4.1 Significant events and transactions 3204
  - 4.1.1 Relevance of other standards in condensed financial statements 3205
- 4.2 Other disclosures required by IAS 34 3206
  - 4.2.1 Location of the specified disclosures in an interim financial report 3208
- 4.3 Illustrative examples of disclosures 3208
  - 4.3.1 Inventory write-down and reversals 3208
  - 4.3.2 Recognition and reversal of impairment losses 3209
  - 4.3.3 Acquisitions and disposals of property, plant and equipment 3210
  - 4.3.4 Capital commitments 3210
  - 4.3.5 Litigation settlements 3210

4.3.6 Changes in circumstances affecting fair values 3211
4.3.7 Default or breach of loan covenants not remedied before the end of interim period 3212
4.3.8 Related party transactions 3212
4.3.9 Transfers between different levels of fair value hierarchy 3214
4.3.10 Contingent liabilities 3214
4.3.11 Accounting policies and methods of computation 3215
4.3.12 Seasonality or cyclicality of operations 3216
4.3.13 Amounts that are unusual because of their nature, size or incidence 3216
4.3.14 Issues, repurchases and repayments of debt and equity securities 3217
4.3.15 Dividends paid 3218
4.3.16 Events after the interim reporting date 3218
4.3.17 Changes in the composition of the entity 3219
4.4 Segment information 3221
4.5 Fair value disclosures for financial instruments 3223
4.6 Disclosure of compliance with IFRS 3224
4.7 Disclosure in relation to the going concern assumption 3226
5 PERIODS FOR WHICH INTERIM FINANCIAL STATEMENTS ARE REQUIRED TO BE PRESENTED 3227
5.1 Other comparative information 3231
5.2 Length of interim reporting period 3232
5.3 Change in financial year-end 3232
5.4 Comparatives following a financial period longer than a year 3234
5.5 When the comparative period is shorter than the current period 3235
6 MATERIALITY 3235
7 DISCLOSURE IN ANNUAL FINANCIAL STATEMENTS 3236
8 RECOGNITION AND MEASUREMENT 3237
8.1 Same accounting policies as in annual financial statements 3237
8.1.1 Measurement on a year-to-date basis 3238
8.1.2 New accounting pronouncements and other changes in accounting policies 3239
8.1.2.A New pronouncements becoming mandatory during the current year 3240
8.1.2.B Voluntary changes of accounting policy 3240
8.1.2.C Transition disclosures in subsequent interim financial statements in the year of adoption 3241
8.1.2.D New pronouncements becoming mandatory in future annual reporting periods 3241

8.1.3 Voluntary changes in presentation.....3242

8.2 Seasonal businesses.....3242

8.2.1 Revenues received seasonally, cyclically, or occasionally.....3242

8.2.2 Costs incurred unevenly during the year.....3243

9 EXAMPLES OF THE RECOGNITION AND MEASUREMENT PRINCIPLES...3243

9.1 Property, plant and equipment and intangible assets.....3244

9.1.1 Depreciation and amortisation.....3244

9.1.2 Impairment of assets.....3244

9.1.3 Recognition of intangible assets.....3244

9.1.4 Capitalisation of borrowing costs.....3245

9.2 Reversal of impairment losses recognised in a previous interim period (IFRIC 10).....3245

9.3 Employee benefits.....3246

9.3.1 Employer payroll taxes and insurance contributions.....3246

9.3.2 Year-end bonuses.....3246

9.3.3 Pensions.....3247

9.3.4 Vacations, holidays, and other short-term paid absences.....3248

9.4 Inventories and cost of sales.....3248

9.4.1 Inventories.....3248

9.4.2 Contractual or anticipated purchase price changes.....3249

9.4.3 Interim period manufacturing cost variances.....3249

9.5 Taxation.....3249

9.5.1 Measuring interim income tax expense.....3249

9.5.2 Changes in the effective tax rate during the year.....3251

9.5.2.A Enacted changes for the current year that apply after the interim reporting date.....3251

9.5.2.B Changes to previously reported estimated income tax rates for the current year.....3252

9.5.2.C Enacted changes applying only to subsequent years.....3253

9.5.3 Difference in financial year and tax year.....3254

9.5.4 Tax loss and tax credit carrybacks and carryforwards.....3254

9.5.5 Tax credits.....3257

9.6 Foreign currency translation.....3257

9.6.1 Foreign currency translation gains and losses.....3257

9.6.2 Interim financial reporting in hyperinflationary economies.....3258

9.7 Provisions, contingencies and accruals for other costs.....3259

9.7.1 Provisions.....3259

9.7.2 Other planned but irregularly occurring costs.....3260

9.7.3 Major planned periodic maintenance or overhaul 3260
9.7.4 Variable lease payments 3260
9.7.5 Levies charged by public authorities 3261
9.8 Earnings per share 3264
10 USE OF ESTIMATES 3265
11 EFFECTIVE DATES AND TRANSITIONAL RULES 3266
11.1 First-time presentation of interim reports complying with IAS 34 3266
11.1.1 Condensed financial statements in the year of incorporation or when an entity converts from its local GAAP to IFRS 3267

List of examples

Example 41.1: Presenting the same headings and sub-totals in condensed interim financial statements 3200
Example 41.2: Disclosure of default of loan covenant 3212
Example 41.3: Going concern assessment under IAS 1 3226
Example 41.4: Entity publishes interim financial reports half-yearly 3228
Example 41.5: Entity publishes interim financial reports quarterly 3229
Example 41.6: Disclosing movements on non-current assets in a complete set of interim financial statements 3232
Example 41.7: Entity changes financial year-end 3232
Example 41.8: Disclosing comparatives in interim financial statements when the preceding financial year covers a longer period 3234
Example 41.9: Disclosing comparatives in interim financial statements when the preceding financial year covers a shorter period 3235
Example 41.10: Measuring interim bonus expense 3246
Example 41.11: Measuring interim income tax expense – progressive tax rates 3250
Example 41.12: Measuring interim income tax expense – quarterly losses 3250
Example 41.13: Measuring interim tax expense – many jurisdictions 3251
Example 41.14: Changes in the effective tax rate during the year 3252
Example 41.15: Enacted changes to tax rates applying after the current year 3253
Example 41.16: Difference in financial year and tax year [IAS 34.B18] 3254
Example 41.17: Tax loss carryforwards expected to be recovered in the current year [IAS 34.B22] 3254
Example 41.18: Tax loss carryforwards in excess of current year expected profits 3255

Example 41.19: Accounting by the parent when a hyperinflationary subsidiary first applies IAS 29 3259
Example 41.20: A levy is triggered in full as soon as the entity generates revenue 3262
Example 41.21: A levy is triggered in full as soon as the entity generates revenue from a certain activity above an annual threshold, which is reduced pro rata when the entity ceases participation in that activity during the year 3262
Example 41.22: A levy is triggered in full as soon as the entity holds the property at a specified date 3263
Example 41.23: A levy is triggered progressively as the entity holds the asset through a specified period of time........ 3263
Example 41.24: Use of estimates 3265

Chapter 41 Interim financial reporting

1 INTRODUCTION

One of the major issues in interim financial reporting is whether the interim period is a discrete period, or whether an interim period is an instalment of the full year. Under the first approach, an entity uses the same accounting policies and principles for annual financial statements as for interim periods. Under the second approach, the purpose of the interim report is to give investors, analysts and other users a guide to the expected outcome for the full year, which requires modifications to the policies and principles used in annual financial reporting. The former approach is generally referred to as the 'discrete' approach, and the latter as the 'integral' approach.

The integral approach is not clearly defined but implies deferring or accruing items of income or expense in order to present measures of performance for that interim period that are more indicative of the expected outcome for the year as a whole. Critics say that this approach obscures the results of the interim period. Proponents say that such modifications prevent distortion; an interim period is a more artificial interval than a financial year, and that to report transactions outside of the context of the annual operating cycle for which they are incurred could potentially present a misleading picture.

In practice, the distinction between discrete and integral approaches is less clear-cut than the description above suggests. IAS 34 – *Interim Financial Reporting* – requires an entity to use a 'year-to-date' approach, *[IAS 34.28]*, which is largely based on the requirement to report the entity's financial position as at the interim reporting date, but for which certain estimates and measurements are based on the expected financial position of the entity at year-end. However, the standard does not allow such estimates and measurements to amount to the 'smoothing' of results (shifting revenue and expenses between different reporting periods in order to present the impression that a business has steady earnings) For example, the estimate of tax expense for an interim period is based on actual profits earned as at the interim reporting date and not the expected tax expense for the year divided by the number of interim reporting periods, as discussed at 9.5 below.

The extent of disclosures in interim reports raises similar questions as to the purpose. If interim reporting is simply a more frequently published version of annual reporting, then the form and content of the interim report should be the same. However, if interim reporting is only an instalment of a longer period, then a reporting package that highlights changes in circumstances during an interim period makes more sense than an update of all the disclosures in an entity's annual financial statements. IAS 34 allows an entity to include either a complete set of financial statements or a condensed version in the interim report. *[IAS 34.4]*. While some companies present a full set of financial statements in their interim reports, predominant practice under IFRS is to present the condensed version. The differences between full and condensed interim financial statements are discussed at 3 below.

There is no requirement for entities that prepare annual financial statements in conformity with IFRS to prepare interim financial statements in accordance with IAS 34. The fact that an entity may not have provided interim financial reports at all or may have provided interim financial reports that do not comply with this standard does not prevent the entity making an explicit and unreserved statement of compliance with IFRS in respect of its annual financial statements. *[IAS 34.2]*. Historically, interim reporting was the prerogative of capital markets and regulators and IAS 34 leaves governments, securities regulators, stock exchanges and others to determine which entities report interim information, how often and how soon after the reporting period. *[IAS 34.1]*. Accordingly, adherence to local regulatory or legal requirements in interim financial reports is required.

Nevertheless, governments and regulators often refer to compliance with IAS 34 as part of their own requirements for interim financial reporting.

1.1 Definitions

The standard defines an interim period as 'a financial reporting period shorter than a full financial year.' *[IAS 34.4]*.

The term 'interim financial report' means a financial report for an interim period that contains either a complete set of financial statements (as described in IAS 1 – *Presentation of Financial Statements*) or a set of condensed financial statements as described in IAS 34 (see 3.2 below). *[IAS 34.4]*.

2 OBJECTIVE AND SCOPE OF IAS 34

2.1 Objective

The stated objective of the standard is 'to prescribe the minimum content of an interim financial report and to prescribe the principles for recognition and measurement in complete or condensed financial statements for an interim period. Timely and reliable interim financial reporting improves the ability of investors, creditors, and others to understand an entity's capacity to generate earnings and cash flows and its financial condition and liquidity.' *[IAS 34 Objective]*.

2.2 Scope

IAS 34 does not prescribe which entities are required to publish interim financial reports, how often, or how soon after the end of an interim period. The standard notes that governments, securities regulators, stock exchanges, and accountancy bodies often require entities whose debt or equity securities are publicly traded to publish interim financial reports. Therefore, in the absence of any specific regulatory requirement (or obligation of the entity, for example, by covenant), entities are not required to publish interim financial information in a form that complies with IAS 34. Instead, IAS 34 only applies if an entity either elects or is required to publish an interim financial report in accordance with IFRS. *[IAS 34.1]*. Accordingly, if an entity's interim financial report states that it complies with IFRS, then the requirements of IAS 34 must be met in full. *[IAS 34.3]*.

The decision to present interim financial reports in accordance with IFRS operates independently of the annual financial statements. Hence, entities may still prepare annual financial statements conforming to IFRS even if their interim financial statements do not comply with IAS 34. *[IAS 34.2]*.

Nevertheless, the IASB encourages publicly traded entities to issue interim financial reports that conform to the recognition, measurement and disclosure principles set out in IAS 34. Those entities are specifically encouraged: *[IAS 34.1]*

(a) to provide interim financial reports at least as of the end of the first half of their financial year; and

(b) to make their interim financial reports available not later than 60 days after the end of the interim period.

However, an entity can only describe an interim financial report as complying with IFRS if it meets all of the requirements of IAS 34. *[IAS 34.3]*. Accordingly, an entity that applies all IFRS recognition and measurement requirements in its interim financial report, but does not include all the required disclosures in IAS 34 may not describe the interim financial report as complying with IFRS.

As shown in the Extract below, Proton Power Systems plc disclosed that its interim financial statements for the period ended 30 June 2019 were not prepared in accordance with IAS 34.

Extract 41.1: Proton Power Systems plc (Unaudited Interim Results for the six months to 30 June 2019)

Notes to the interim report [extract]

1. **Basis of preparation** [extract]

The 31 December 2018 consolidated financial statements of Proton Power Systems plc were prepared in accordance with International Financial Reporting Standards (IFRS) as issued by the International Accounting Standards Board (IASB) as adopted by the European Union and with those parts of the Companies Act 2006 applicable to those companies under IFRS. [...] The condensed consolidated interim financial statements have been prepared in accordance with the accounting policies adopted in the 31 December 2018 statutory audited financial statements. No new accounting standards have been adopted by the group since preparing its last annual report.

The Group has chosen not to adopt IAS 34 (Interim Financial Statements) in preparing these financial statements therefore the interim financial information is not in full compliance with IFRS.

3 COMPONENTS, FORM AND CONTENT OF AN INTERIM FINANCIAL REPORT UNDER IAS 34

The standard does not prohibit or discourage an entity from: *[IAS 34.7]*

- publishing a complete set of financial statements (as described in IAS 1) in its interim financial report, rather than condensed financial statements and selected explanatory notes; or
- including in condensed interim financial statements more than the minimum line items or selected explanatory notes as set out in IAS 34.

The recognition and measurement guidance in the standard, together with the note disclosures required by the standard, apply to both complete and condensed financial statements presented for an interim period. This means that a complete set of financial statements, prepared for an interim period, would include all of the disclosures required by IAS 34 as well as those required by other IFRSs. *[IAS 34.7]*.

3.1 Complete set of interim financial statements

An entity that publishes a complete set of financial statements in its interim financial report should include the following components, as required in IAS 1: *[IAS 34.5]*

(a) a statement of financial position as at the end of the interim period;

(b) a statement of profit or loss and other comprehensive income for the period;

(c) a statement of changes in equity for the period;

(d) a statement of cash flows for the period;

(e) notes, comprising significant accounting policies and other explanatory information;

(f) comparative information in respect of the preceding period for each of the statements listed at (a) to (d) above and related notes, and for all amounts reported in the current period's financial statements (unless specifically exempted by another IFRS); as well as (if relevant to understanding the current period's financial statements) comparative information for narrative and descriptive information; *[IAS 1.38, 38A]* and

(g) a statement of financial position as at the beginning of the preceding period (without a requirement for related notes) when: *[IAS 1.40A-40D]*

  (i) an accounting policy has been applied retrospectively; or

  (ii) a retrospective restatement has been made; or

  (iii) items have been reclassified,

  and the effect of such retrospective application on the information presented in that statement of financial position is material.

Entities may use alternative titles for the above statements other than those stated above. For example, an entity may use the title 'statement of comprehensive income' instead of 'statement of profit or loss and other comprehensive income'. *[IAS 34.5]*. Also, an entity can refer to the 'statement of financial position' as 'balance sheet'.

If an entity publishes a complete set of financial statements in its interim financial report, the form and content of those statements should conform to the requirements of IAS 1. *[IAS 34.9]*. These requirements are discussed in Chapter 3 at 3. In addition, the entity should disclose the information specifically required by IAS 34 for interim financial reports as well as those required by other IFRSs (particularly those discussed at 4 below). *[IAS 34.7]*.

3.2 Condensed interim financial statements

In the interest of timeliness, cost, and avoiding repetition of previously reported information, an entity might be required to or elect to give less information at interim dates as compared with its annual financial statements. *[IAS 34.6]*. The standard defines the minimum content of an interim report, as including condensed financial statements and selected notes, as follows: *[IAS 34.6, 8]*

(a) a condensed statement of financial position;

(b) a condensed statement or condensed statements of profit or loss and other comprehensive income;

(c) a condensed statement of changes in equity;

(d) a condensed statement of cash flows; and

(e) selected explanatory notes.

IAS 34 requires entities to confirm that the same accounting policies and methods of computation are followed in the interim financial statements as compared to their most recent annual financial statements or, if those policies or methods have changed, to describe the nature and effect of the change (see 4.2 below). *[IAS 34.16A(a)]*. Accordingly, an entity would only depart from the presentation as applied in its most recent annual financial statements if it had determined that the format will change in its next annual financial statements.

The condensed statement of profit or loss and other comprehensive income referred to at (b) above should be presented using the same format as the entity's annual financial statements. Accordingly, if an entity presents a separate statement of profit or loss in its annual financial statements, then it should present a separate statement in the interim financial report as well. Similarly, if a combined statement of profit or loss and other comprehensive income is presented in the annual financial statements, the same format must be adopted in the interim financial report. *[IAS 34.8A]*.

As a minimum, the condensed financial statements should include each of the headings and subtotals that were included in the entity's last annual financial statements. *[IAS 34.10]*. However, the condensed financial statements do not need to look exactly like the year-end financial statements. Whilst IAS 34 requires 'headings and subtotals' to be the same, there is no similar requirement for the 'line items' under those headings referred to in IAS 1. *[IAS 1.54, 82]*.

A literal reading could mean that an entity is only required to present non-current assets, current assets, etc. on an interim statement of financial position. However, one of the purposes of an interim report is to help the users of the financial statements to understand the changes in financial position and performance of the entity since the previous annual reporting period. *[IAS 34.15]*. To that end, IAS 34 also requires additional line items or notes to be included if their omission makes the condensed financial statements misleading. *[IAS 34.10]*. In addition, the overriding goal of IAS 34 is to ensure that the interim report includes all information necessary to understand the financial position and the performance during the interim period. *[IAS 34.25]*. Therefore, the aggregation of information to this extent would be inconsistent with the objectives of IAS 34 and judgement is required to determine which line items provide useful information for decision-makers, and are presented, accordingly.

Inclusion of most of the line items in the annual financial statements has the benefit of providing the most information to help users of the financial statements understand the changes since the previous year-end. Nonetheless, entities may aggregate line items used in the annual financial statements, if doing so does not render the information misleading or prevent users of the financial statements from performing meaningful trend analysis. In response to a submission relating to the presentation and content of the condensed statement of cash flows, the Interpretations Committee expressed a view that a three-line condensed statement of cash flows showing only a total for each of operating, investing and financing cash flows would generally not meet the requirements of IAS 34 as set out above.[1]

Consideration should also be given to regulatory requirements, for example, where a regulator requires an entity to present certain line items using some form of materiality criteria (e.g. in terms of amount, percentage relative to headings, or percentage change from prior periods).

Although it is not usual for an entity to use a presentation approach in its condensed interim financial statements that is different from its annual financial statements, the following example illustrates one possible way in which an entity might choose to combine line items presented separately in the annual financial statements when preparing a condensed set of interim financial statements. However, such presentation is at the discretion of management, based on facts and circumstances, including materiality (as noted above), regulatory environment, and the overarching goal of IAS 34 to provide relevant information. *[IAS 34.25]*. Accordingly, other presentations may be appropriate.

Example 41.1: Presenting the same headings and sub-totals in condensed interim financial statements

3.3 Requirements for both complete and condensed interim financial information

The general principles for preparing annual financial statements are equally applicable to condensed interim financial statements. These principles include fair presentation, going concern, the accrual basis of accounting, materiality and aggregation, and offsetting. *[IAS 1.4, 15-35]*. (See Chapter 3 at 4.1).

Furthermore, the following requirements apply irrespective of whether an entity provides complete or condensed financial statements for an interim period:

- if applicable, basic and diluted earnings per share should be presented on the face of the statement that presents items of profit or loss for an interim period. *[IAS 34.11]*. If the entity presents items of profit or loss in a separate statement, it should present basic and diluted earnings per share in that statement; *[IAS 34.11A]* and
- if the last annual financial statements were consolidated financial statements, the interim financial report should also be prepared on a consolidated basis, if the entity continues to be a parent in the interim period. *[IAS 34.14]*.

If the entity's last annual financial report included the parent's separate financial statements and consolidated financial statements, IAS 34 neither requires nor prohibits the inclusion of the parent's separate financial statements in the interim financial report. *[IAS 34.14]*.

3.4 Management commentary

A management commentary is not required by IAS 34, but frequently included by entities in their interim financial reports along with the interim financial statements. In most cases the requirement for a narrative review comes from local stock market regulations and the entities should, therefore, follow the relevant guidance issued by those regulators.

IAS 34 allows information required under the standard to be presented outside the interim financial statements, i.e. in other parts of interim financial report (such as a management commentary or risk report). *[IAS 34.16A]*. The standard itself does not establish specific requirements for the content of a management commentary beyond what should be contained in (or cross-referred from) the interim financial statements (see 4.2.1 below).

4 DISCLOSURES IN CONDENSED FINANCIAL STATEMENTS

IAS 34 combines a number of disclosure principles:

- Entities should provide information about events and transactions in the interim period that are significant to an understanding of the changes in financial position and performance since the last annual reporting period. In this context it is not necessary to provide relatively insignificant updates to information reported in the last annual financial statements (see 4.1 below). *[IAS 34.15, 15A]*.
- In addition to information to explain significant changes since the last annual reporting period, a number of specific disclosures are required to be given, if not disclosed elsewhere in the interim financial report. *[IAS 34.16A]*.
- The materiality assessment for disclosure is based on the interim period by itself, to ensure all information is provided that is relevant to understanding the entity's financial position and its performance during the interim period (see 6 below). *[IAS 34.25]*.

Overall, applying those disclosure principles requires the exercise of judgement by the entity regarding what information is significant and relevant. The practice of interim reporting confirms that entities take advantage of that room for judgement, both for disclosures provided in the notes to the financial statements and outside.

4.1 Significant events and transactions

IAS 34 presumes that users of an entity's interim financial report also have access to its most recent annual financial report. *[IAS 34.15A]*. On that basis, an interim financial report should explain events and transactions that are significant to an understanding of the changes in financial position and performance of the entity since the previous annual reporting period and provide an update to the relevant information included in the financial statements of the previous year. *[IAS 34.15, 15C]*. The inclusion of only selected explanatory notes is consistent with the purpose of an interim financial report, to update the latest complete set of annual financial statements. Accordingly, condensed financial statements avoid duplicating previously reported information and focus on new activities, events, and circumstances. *[IAS 34.6]*.

The standard requires disclosure of the following events and transactions in interim financial reports, if they are significant: *[IAS 34.15B]*

(a) write-down of inventories to net realisable value and the reversal of such a write-down;
(b) recognition of a loss from the impairment of financial assets, property, plant, and equipment, intangible assets, assets arising from contracts with customers, or other assets, and the reversal of such an impairment loss;
(c) reversal of any provisions for the costs of restructuring;
(d) acquisitions and disposals of items of property, plant, and equipment;
(e) commitments for the purchase of property, plant, and equipment;
(f) litigation settlements;
(g) corrections of prior period errors;
(h) changes in the business or economic circumstances that affect the fair value of the entity's financial assets and financial liabilities, whether those assets or liabilities are recognised at fair value or amortised cost;

(i) any loan default or breach of a loan agreement that is not remedied on or before the end of the reporting period;

(j) related party transactions;

(k) transfers between levels of the fair value hierarchy used in measuring the fair value of financial instruments;

(l) changes in the classification of financial assets as a result of a change in the purpose or use of those assets; and

(m) changes in contingent liabilities or contingent assets.

The standard specifies that the above list of events and transactions is not exhaustive and the interim financial report should explain any additional events and transactions that are significant to an understanding of changes in the entity's financial position and performance. *[IAS 34.15, 15B]*. Therefore, when information relating to items not on the above list changes significantly, an entity should still provide disclosure in the interim financial statements in sufficient detail to explain the nature of the change and any changes in estimates. This would apply, for example, if:

- the range of reasonably possible changes in key assumptions has significantly changed since the end of the last annual reporting period, an update of relevant sensitivity disclosures may be required;
- the values of non-financial assets and liabilities that are measured at fair value change significantly.

4.1.1 Relevance of other standards in condensed financial statements

Whilst other standards specify disclosures required in a complete set of financial statements, if an entity's interim financial report includes only condensed financial statements as described in IAS 34, then the disclosures required by those other standards are not mandatory. However, if disclosure is considered to be necessary in the context of an interim report, those other standards provide guidance on the appropriate disclosures for many of these items. *[IAS 34.15C]*. For example, in meeting the requirements of (g) above to disclose the impact of corrections of prior period errors, the requirements of IAS 8 – *Accounting Policies, Changes in Accounting Estimates and Errors* – would be relevant to consider (see Chapter 3 at 5.3).

In practice, entities exercise judgement to determine whether including the disclosures required by other standards are material to an understanding of the entity and will provide a benefit to users of the interim financial statements. *[IAS 34.25]*. For example, the existence of acquisitions and disposal of items of property plant and equipment does not automatically require the interim report to include a reconciliation of the carrying amount at the beginning and end of the interim period. *[IAS 16.73(e)]*. In many cases, a narrative disclosure would be sufficient, and in some cases, the change may be immaterial, and therefore no disclosures are required. However, in an interim period with material changes, as for instance when assets are acquired by purchase, obtained in a business combination, and transferred to a disposal unit as well as sold in the normal course of business, such a reconciliation could be judged to be an appropriate way of presenting this information in the interim financial statements.

4.2 Other disclosures required by IAS 34

In addition to disclosing significant events and transactions as discussed at 4.1 above, IAS 34 requires an entity to include the following information in the notes to its interim financial statements if not disclosed elsewhere in the interim financial report: *[IAS 34.16A]*

(a) a statement that the same accounting policies and methods of computation are followed in the interim financial statements as in the most recent annual financial statements or, if those policies or methods have changed, a description of the nature and effect of the change;

(b) explanatory comments about the seasonality or cyclicality of interim operations;

(c) the nature and amount of items affecting assets, liabilities, equity, net income, or cash flows that are unusual because of their nature, size, or incidence;

(d) the nature and amount of changes in estimates of amounts reported in prior interim periods of the current year or changes in estimates of amounts reported in prior years;

(e) issues, repurchases, and repayments of debt and equity securities;

(f) dividends paid (aggregate or per share) separately for ordinary shares and other shares;

(g) certain segment disclosures required by IFRS 8 – *Operating Segments* – as discussed at 4.4 below;

(h) events after the interim period that are not reflected in the financial statements for the interim period;

(i) the effect of changes in the composition of the entity during the interim period, including business combinations, obtaining or losing control of subsidiaries and long-term investments, restructurings, and discontinued operations. For business combinations, the entity should disclose the information required under IFRS 3 – *Business Combinations* (see Chapter 9 at 16);

(j) for financial instruments, certain fair value disclosures required by IFRS 7 – *Financial Instruments: Disclosures* – and IFRS 13 – *Fair Value Measurement* – as discussed at 4.5 below;

(k) for entities becoming, or ceasing to be, investment entities, as defined in IFRS 10 – *Consolidated Financial Statements*, the disclosures in IFRS 12 – *Disclosure of Interests in Other Entities* – as required by paragraph 9B of that standard (see Chapter 13 at 4.6.2); and

(l) the disaggregation of revenue from contracts with customers required by paragraphs 114 and 115 of IFRS 15 – *Revenue from Contracts with Customers*. The requirement to disclose disaggregated revenue in interim financial statements is similar to the requirements applicable to annual financial statements. See Chapter 32 at 3.2.1.A for illustrative examples of disclosures.

This information is disclosed on a financial year-to-date basis. *[IAS 34.16A]*. However, the requirement in item (i) above for disclosures of business combinations applies not only for those effected during the current interim period, but also to business combinations after the reporting period but before the interim financial report is authorised for issue. *[IFRS 3.59(b), IFRS 3.B66]*. An entity is not required to provide all of the disclosures for business combinations after the reporting period, if the accounting for the business combination is incomplete as at the date on which the financial statements are authorised for issue. In this case, the entity should state which disclosures cannot be made and the reasons why they cannot be made. *[IFRS 3.B66]*.

IFRS 3 requires disclosures in aggregate for business combinations effected during the reporting period that are individually immaterial. *[IFRS 3.B65]*. However, materiality is assessed for the interim period financial data, *[IAS 34.23]*, which implies that IAS 34 may require detailed disclosures on business combinations that are material to an interim period, even if they could be aggregated for disclosure purposes in the annual financial statements.

The list above also requires disclosure of the effect of changes in the composition of the entity arising from disposals, discontinued operations and restructurings in the interim period. *[IAS 34.16A(i)]*.

If an entity has operations that are discontinued or disposed of during an interim period, these operations should be presented separately in the condensed interim statement of comprehensive income following the principles set out in IFRS 5 – *Non-current Assets Held for Sale and Discontinued Operations*. In addition, if an entity has non-current assets or a disposal group classified as held for sale or distribution at the end of the interim reporting period, then these should be measured in accordance with the requirements of IFRS 5 and presented separately from other assets and liabilities in the condensed interim statement of financial position.

An entity contemplating a significant restructuring that will have an impact on its composition should follow the guidance in IAS 37 – *Provisions, Contingent Liabilities and Contingent Assets* – for the recognition of any restructuring cost, *[IAS 37.71]*, and IAS 19 – *Employee Benefits* – for termination benefits. *[IAS 19.165(b)]*. In subsequent interim periods any significant changes to provisions will require disclosure. *[IAS 34.15B(c), 16A(d)]*.

The inclusion of the above disclosure requirements among the items required by the standard to be given 'in addition to disclosing significant events and transactions', *[IAS 34.16A]*, distinguishes them from the items listed at 4.1 above, which are disclosed to update information presented in the most recent annual financial report. *[IAS 34.15]*. Therefore, disclosure of the above information is required for each interim reporting period, subject only to a materiality assessment in relation to that interim report. *[IAS 34.25]*. In making that judgement care would need to be taken to ensure any omitted information would not make the interim financial report incomplete and therefore misleading.

4.2.1 Location of the specified disclosures in an interim financial report

IAS 34 defines an 'interim financial report' as 'a financial report containing either a complete set of financial statements... or a set of condensed financial statements... for an interim period.' *[IAS 34.4]*. Therefore, since an interim financial report contains the interim financial statements, it is clear that these are two different concepts. Accordingly, an entity is not required to disclose the information listed at 4.2 above in the interim financial statements themselves (but rather, might include the disclosures in the management commentary), as long as a cross-reference is provided from the financial statements to the location of the information included in another part of the interim financial report. *[IAS 34.16A]*.

Additionally, for a cross-reference to be acceptable, the information given 'elsewhere in the interim financial report' needs to both satisfy the disclosure requirements in IFRSs and be available on the same terms as the interim financial statements, i.e. users should have access to the referenced material (for example, the management commentary or a risk report) on the same basis and at the same time as they have for accessing the condensed financial statements from which the reference is made.

The cross-reference should identify the specific part that includes the required disclosure to allow the reader to easily navigate within the interim financial report.

4.3 Illustrative examples of disclosures

The extracts and examples below illustrate the disclosures required by IAS 34.

4.3.1 Inventory write-down and reversals

In the extract below, BP p.l.c. discloses write-downs of its inventories and reversals in the current and corresponding periods. *[IAS 34.15B(a)]*.

Extract 41.2: BP p.l.c. Group results (First quarter 2020)

Notes [extract]

Note 11. Inventory valuation

A provision of $3,596 million was held against hydrocarbon inventories at 31 March 2020 ($290 million at 31 December 2019 and $124 million at 31 March 2019) to write them down to their net realizable value. The net movement charged to the income statement during the first quarter 2020 was $3,341 million as a result of significant decreases in prices for refined products, oil and gas during March (fourth quarter 2019 was a credit of $80 million and first quarter 2019 was a credit of $480 million).

In the Extract below, Equinor ASA discloses a reversal of an inventory write-down in the current period. *[IAS 34.15B(a)]*.

Extract 41.3: Equinor ASA (Second quarter 2020)

Condensed interim financial statement and notes [extract]

Notes to the Condensed interim financial statements [extract]
2 Segments [extract]

Due to the recovery in commodity prices, at the end of the second quarter as compared to the end of the first quarter, MMP has reversed USD 605 million in write-down of inventory included in the line item Purchases [net of inventory variation]. The impact is largely offset by loss on derivatives included in the line item Revenues third party, other revenue and other income.

4.3.2 Recognition and reversal of impairment losses

In the Extract below, as part of its note on segments, Equinor ASA explains the recognition and reversal of impairment losses during the reporting period. *[IAS 34.15B(b)]*.

Extract 41.4: Equinor ASA (First quarter 2020)

Condensed interim financial statement and notes [extract]

Notes to the Condensed interim financial statements [extract]
2 Segments [extract]

In the first quarter of 2020 Equinor recognised net impairment of USD 2,453 million of which USD 59 million was classified as exploration expenses.

In the E&P Norway segment the net impairment was USD 862 million, hereof USD 3 million related to exploration assets. The impairments were triggered by decreased short-term oil price assumptions and construction delays mainly caused by the Covid-19 pandemic.

In the E&P International segment the net impairment was USD 1,397 million of which USD 56 million was classified as exploration expenses. In the North America onshore unconventional area the impairments were USD 872 million, in the North America conventional Gulf of Mexico USD 142 million, in the North America offshore other areas USD 86 million. In Europe and Asia the impairment was USD 289 million and the impairment reversal was USD 47 million. The impairments were triggered mainly by the decreased short-term oil price assumptions, but also construction delays and re-phasing of the production in the North America – conventional other area and in the Europe and Asia area caused by the Covid-19 pandemic. In the Europe and Asia area the impairment reversal of USD 47 million was caused by increased reserves. Impairments classified as exploration were USD 16 million in the Sub Sahara area and USD 40 million in Australia.

In the MMP segment the impairments were USD 194 million whereof USD 193 million related to a refinery due to increased asset retirement estimate and expected lower refinery margins in the short term.

4.3.3 Acquisitions and disposals of property, plant and equipment

In the Extract below, Hellenic Company for Telecommunications and Telematic Applications S.A. (Forthnet S.A.) gives a narrative description of its acquisitions of property, plant and equipment in the interim period. *[IAS 34.15B(d)]*.

Extract 41.5: Forthnet S.A. (Interim financial report for the period 1 January 2019 to 30 June 2019)

NOTES TO THE INTERIM CONDENSED FINANCIAL STATEMENTS [extract]

13. Property, plant and equipment

During the period from January 1, 2019 until June 30, 2019, the Group's total investments in tangible assets amounted to € 2,446,283 and those of the Company's amounted to € 2,389,554 and mainly concern the expansion of Forthnet's private telecommunication network (June 30, 2018: € 1,697,843 for the Group and € 1,556,471 for the Company).

It is noted that there are encumbrances on the privately owned building of the Company in Kallithea, Attica, in favour of Alpha Bank, National Bank of Greece SA and Piraeus Bank SA with a total value of € 6.5 million as collateral to the Banks claims' from corresponding open account credit agreements with Forthnet.

It is noted that in the current period the "Right of use assets" that were included as at December 31, 2018 in the "Property, plant & equipment" and which amounted for the Group to € 30,203,693 and for the Company to € 2,015,561, were reclassified as part of the transition to IFRS 16 in the statement of financial position's line "Right-of-use assets". As of June 30, 2019 the amounts for the Group and the Company amounted to € 25,478,998 and 1,988,888 respectively (Note 5).

4.3.4 Capital commitments

In a brief descriptive note, Deutsche Lufthansa AG discloses its commitments for capital expenditure. *[IAS 34.15B(e)]*.

Extract 41.6: Deutsche Lufthansa AG (1st interim report January – March 2020)

Interim financial statements [extract]

Notes [extract]

4 Contingencies and events after the reporting period [extract]

At the end of March 2020 there were order commitments of EUR 15.6bn for capital expenditure on property, plant and equipment, including repairable spare parts, and for intangible assets. As of 31 December 2019, the order commitments came to EUR 14.6bn.

4.3.5 Litigation settlements

International Consolidated Airlines Group S.A provides details about significant litigation in its 2019 interim report. The extract below illustrates its disclosure about related settlements. *[IAS 34.15B(f)]*.

Extract 41.7: International Consolidated Airlines Group, S.A. (Six months to June 30, 2019)

NOTES TO THE ACCOUNTS [extract]

15. EMPLOYEE BENEFIT OBLIGATIONS [extract]

The principal funded defined benefit pension schemes within the Group are the Airways Pension Scheme ('APS') and the New Airways Pension Scheme ('NAPS').

[...]

APS has been closed to new members since 1984. The benefits provided under APS are based on final average pensionable pay and, for the majority of members, are subject to inflationary increases in payment in line with the Government's Pension Increase (Review) Orders (PIRO), which are based on the CPI. The Trustee of APS proposed an additional discretionary increase above CPI for pensions in payment for the year ended March 31, 2014. British Airways challenged the decision and initiated legal proceedings to determine the legitimacy of the discretionary increase. The High Court issued a judgment in May 2017, which determined that the Trustee had the power to grant discretionary increases, whilst reiterating the Trustee must take into consideration all relevant factors and ignore irrelevant factors. British Airways appealed the judgment to the Court of Appeal. On July 5, 2018 the Court of Appeal released its judgment, upholding British Airways' appeal, concluding the Trustee did not have the power to introduce a discretionary increase rule. Following the judgment, the Trustee was allowed permission to appeal to the Supreme Court; and has appealed. In April 2019, subject to obtaining the approval of the High Court, the Trustee Directors of the Airways Pension Scheme unanimously agreed with British Airways terms for an out-of-court settlement ('the agreement'). This would bring to an end the litigation that commenced in 2013 and which is otherwise due to proceed to appeal at the Supreme Court later this year. Under the terms of the proposed settlement, the Trustee of APS will be permitted, subject to some affordability tests, to award Discretionary Increases so that APS pensions are increased up to the annual change in the Retail Prices Index (RPI) from 2021 with interim catch-up increases. British Airways will cease paying further deficit recovery contributions, including cash sweep payments, and the APS Trustee will withdraw its appeal to the Supreme Court. British Airways will provide a €45 million indemnity, payable in part or full as appropriate in late 2027/2028, in the event of adverse experience leading to the 2027 valuation showing the scheme is not able to pay pension increases at RPI for the remaining life of the scheme.

4.3.6 *Changes in circumstances affecting fair values*

In its interim report for 2019, Yorkshire Building Society describes the effect of volatility in financial markets during the period. *[IAS 34.15B(h)]*.

Extract 41.8: Yorkshire Building Society (Six months ended 30 June 2019)

Chief Executive's summary [extract]

Strategic update: [extract]

- The current macroeconomic and market environment is very dynamic, with the impact of trade wars, the UK's exit from the EU and political uncertainty likely to continue into the foreseeable future, impacting business and consumer confidence and growth. Uncertainty around the future Bank Rate path is also leading to volatility in financial markets.

Business highlights [extract]

- A fair value volatility loss of £24.2m (30 June 2018: gain of £1.5m) is adverse to 2018 mainly due to a significant fall in swap rates since the beginning of the year. This is as a result of volatility in the financial markets, and is an accounting adjustment which will typically reverse in future periods.

4.3.7 Default or breach of loan covenants not remedied before the end of interim period

The Example below illustrates disclosure of a loan default that has not been remedied on or before the end of the reporting period, *[IAS 34.15B(i)]*, and the consequent impact on classification of the loans in the interim financial statements.

Example 41.2: Disclosure of default of loan covenant

As at 30 June 2021, Entity A did not comply with certain financial covenants set out in its existing agreements for the ordinary bond loans issued by the Entity amounting to €100 million (hereinafter the Existing OBLs) and had not repaid matured loan instalments of €100 million from the Existing OBLs. Consequently, as of 30 June 2021, all Existing OBLs are classified as short-term liabilities. As a result of bond loans being presented as short-term liabilities as at 30 June 2021, total short-term liabilities of Entity A exceeded total short-term assets by €125 million.

4.3.8 Related party transactions

In Extract 41.9 below, Deutsche Bank Aktiengesellschaft discloses related party transactions. *[IAS 34.15B(j)]*.

Extract 41.9: Deutsche Bank Aktiengesellschaft (Interim report as of June 30, 2019)

Other Financial Information [extract]
Related Party Transactions

Parties are considered to be related if one party has the ability to directly or indirectly control the other party or exercise significant influence over the other party in making financial or operational decisions. The Group's related parties include:

- key management personnel, close family members of key management personnel and entities which are controlled, significantly influenced by, or for which significant voting power is held by key management personnel or their close family members,
- subsidiaries, joint ventures and associates and their respective subsidiaries, and
- post-employment benefit plans for the benefit of Deutsche Bank employees.

Transactions with Key Management Personnel

Key management personnel are those persons having authority and responsibility for planning, directing and controlling the activities of Deutsche Bank Group, directly or indirectly. The Group considers the members of the Management Board as currently mandated and the Supervisory Board of the parent company to constitute key management personnel for purposes of IAS 24. Among the Group's transactions with key management personnel as of June 30, 2019, were loans and commitments of € 41 million and deposits of € 19 million. As of December 31, 2018, there were loans and commitments of € 45 million and deposits of € 34 million among the Group's transactions with key management personnel. In addition, the Group provides banking services, such as payment and account services as well as investment advice, to key management personnel and their close family members.

Transactions with Subsidiaries, Associates and Joint Ventures

Transactions between Deutsche Bank AG and its subsidiaries meet the definition of related party transactions. If these transactions are eliminated on consolidation, they are not disclosed as related party transactions. Transactions between the Group and its associated companies and joint ventures and their respective subsidiaries also qualify as related party transactions.

Transactions for subsidiaries, joint ventures and associates are presented combined in below table as these are not material individually.

Loans issued and guarantees granted

in € m.	Jun 30, 2019	Dec 31, 2018
Loans outstanding, beginning of period	**228**	256
Movement in loans during the period[1]	(2)	(21)
Changes in the group of consolidated companies	0	0
Exchange rate changes/other	0	(7)
Loans outstanding, end of period[2]	**230**	228
Other credit risk related transactions:		
Allowance for loan losses	0	0
Provision for loan losses	0	0
Guarantees and commitments	3	3

[1] Net impact of loans issued and loans repayment during the year is shown as “Movement in loans during the period”.

[2] There were no past due loans as of June 30, 2019 and December 31, 2018. For the above loans, the Group held collateral of € 5 million and € 14 million as of June 30, 2019 and December 31, 2018, respectively.

Deposits received

in € m.	Jun 30, 2019	Dec 31, 2018
Deposits, beginning of period	**68**	67
Movement in deposits during the period[1]	(22)	2
Changes in the group of consolidated companies	0	0
Exchange rate changes/other	0	(0)
Deposits, end of period	**47**	68

[1] Net impact of deposits received and deposits repaid during the year is shown as “Movement in deposits during the period”.

Other transactions

Trading assets and positive market values from derivative financial transactions with associated companies amounted to € 2 million as of June 30, 2019, and € 2 million as of December 31, 2018. Trading liabilities and negative market values from derivative financial transactions with associated companies were € 0 million as of June 30, 2019, and € 0 million as of December 31, 2018.

Transactions with Pension Plans

The Group has business relationships with a number of its pension plans pursuant to which it provides financial services to these plans, including investment management. Pension funds may hold or trade Deutsche Bank AG shares or securities. As of June 30, 2019, transactions with these plans were not material for the Group.

4.3.9 Transfers between different levels of fair value hierarchy

HSBC discloses in the extract below transfers of items between level 1 and level 2 of the fair value hierarchy. *[IAS 34.15B(k)]*. The disclosures in relation to transfers into and out of level 3 are included in a separate reconciliation of the movements from the opening balances to closing balances as required by paragraph 93(e) of IFRS 13 and paragraph 16A(j) of IAS 34 (see 4.5 below).

Extract 41.10: HSBC Holdings plc (Interim report 2019)

Notes on the Financial Statements [extract]

5 Fair values of financial instruments carried at fair value [extract]

Transfers between Level 1 and Level 2 fair values

	Assets				Liabilities		
	Financial investments	Trading assets	Designated and otherwise mandatorily measured at fair value	Derivatives	Trading liabilities	Designated at fair value	Derivatives
	$m	$m	$m	$m	$m	$m	$m
At 30 Jun 2019							
Transfers from Level 1 to Level 2	1,526	663	–	23	117	–	–
Transfers from Level 2 to Level 1	2,696	1,252	347	111	198	–	117
At 31 Dec 2018							
Transfers from Level 1 to Level 2	367	435	2	1	79	–	–
Transfers from Level 2 to Level 1	17,861	4,959	85	128	1,821	–	138

Transfers between levels of the fair value hierarchy are deemed to occur at the end of each quarterly reporting period. Transfers into and out of Levels of the fair value hierarchy are primarily attributable to observability of valuation inputs and price transparency.

4.3.10 Contingent liabilities

In the Extract below, Downer EDI Limited discloses changes in its contingent liabilities during the interim period in the notes to the condensed consolidated half-year financial report. *[IAS 34.15B(m)]*.

Extract 41.11: Downer EDI Limited (Half-year ended 31 December 2019)

Notes to the condensed consolidated financial report for the half-year ended 31 December 2019 [extract]

D9. Contingent liabilities [extract]

Other contingent liabilities [extract]

vi) On 16 September 2015, the Group announced that it had terminated a contract with Tecnicas Reunidas S.A. ("TR") following TR's failure to remedy a substantial breach of the contract and that the Group is pursuing a claim against TR in the order of $65 million. Downer has since demobilised from the site and has commenced a claim that will be determined via an arbitration process, with a hearing date currently expected to occur in April 2020. TR has initiated a counter-claim, which is being defended by Downer.

4.3.11 Accounting policies and methods of computation

In the Extract below, Daimler AG discloses changes to the accounting policies applied in its 2019 interim report. *[IAS 34.16A(a)]*. Using the guidance in IAS 8, Daimler AG provides information for the adoption of IFRS 16 – *Leases.*

Extract 41.12: Daimler AG (Interim report Q2 2019)

Notes to the Interim Consolidated Financial Statements [extract]

1. **Presentation of the Interim Consolidated Financial Statements** [extract]

IFRSs initially applied in the reporting period [extract]

In January 2016, the IASB published **IFRS 16 Leases**, replacing IAS 17 Leases and IFRIC 4 Determining Whether an Arrangement Contains a Lease and other interpretations. [...]

Daimler applies IFRS 16 for the first time at January 1, 2019. In compliance with the transition regulations, Daimler does not adjust the prior-year figures and presents the not significant accumulated transitional effects in retained earnings.

Daimler as lessee uses the following practical expedients of IFRS 16 at the date of initial application:

- With leases previously classified as operating leases according to IAS 17, the lease liability is measured at the present value of the outstanding lease payments, discounted by the incremental borrowing rate at January 1, 2019. The weighted average incremental borrowing rate was 2.27%. The respective right-of-use asset is generally recognized at an amount equal to the lease liability.
- An impairment review is not performed. Instead, a right-of-use asset is adjusted by the amount of any provision for onerous leases recognized in the Statement of Financial Position at December 31, 2018.
- Regardless of their original lease term, leases for which the lease term ends at the latest on December 31, 2019 are recognized as short-term leases.
- At the date of initial application, the measurement of a right-of-use asset excludes the initial direct costs.
- Current knowledge is given due consideration when determining the lease term if the contract contains options to extend or terminate the lease.

In the context of the transition to IFRS 16, right-of-use assets of €3,777 million (including finance leases of €335 million) and lease liabilities of €3,790 million were recognized at January 1, 2019. The following reconciliation (see ↗ **E.08**) to the opening balance for lease liabilities as at January 1, 2019 is based on the other financial obligations from rental agreements and operating leases at December 31, 2018.

E.08

Reconciliation to the lease liabilities in accordance with IFRS 16 In millions of euros	
Other financial obligations resulting from rental agreements and operating leases in accordance with IAS 17 at December 31, 2018	3,800
Exemptions for short-term leases	–226
Exemptions for leases of low-value assets	–36
Payments related to options to extend or terminate a lease	256
Payments related to non-lease components	77
Others	75
Obligations from operating lease arrangements (undiscounted)	3,946
Discounting	–503
Obligations from operating lease arrangements (discounted)	3,443
Carrying amount of liabilities from finance leases in accordance with IAS 17 as at December 31, 2018	347
Carrying amount of lease liability in accordance with IFRS 16 as at January 1, 2019	3,790

The right-of-use assets and lease liabilities include assets and liabilities, which were recognized until December 31, 2018 as finance leases in accordance with IAS 17.

4.3.12 Seasonality or cyclicality of operations

Extract 41.13 below shows how Ardagh Group S.A. discloses the effects of seasonality in its interim report. *[IAS 34.16A(b)]*.

Extract 41.13: Ardagh Group S.A. (Interim ended March 2020)

NOTES TO THE UNAUDITED CONSOLIDATED INTERIM FINANCIAL STATEMENTS [extract]

18. Seasonality of operations [extract]

The Group's revenue and cash flows are both subject to seasonal fluctuations with the Group generally building inventories in anticipation of these seasonal demands resulting in working capital requirements typically being the greatest at the end of the first quarter of the year.

The demand for our metal beverage products is strongest during spells of warm weather and therefore demand typically peaks during the summer months, as well as in the period leading up to holidays in December. Demand for beverage products within our Glass Packaging business is similarly strongest during the summer and during periods of warm weather, as well as the period leading up to holidays in December.

The Group manages the seasonality of working capital principally by supplementing operating cash flows with drawings under our Global Asset Based Loan facility.

4.3.13 Amounts that are unusual because of their nature, size or incidence

Sanofi discloses the nature and effects of unusual items in Extract 41.14 below by identifying 'restructuring costs' and similar items. *[IAS 34.16A(c)]*. The footnote provides further information on the nature of the costs. See Extract 41.20 for another example illustrating disclosures about restructuring activities.

Extract 41.14: Sanofi(2019 Half-Year Financial Report)

B/ SIGNIFICANT INFORMATION FOR THE FIRST HALF OF 2019 [extract]

B.16. RESTRUCTURING COSTS AND SIMILAR ITEMS

Restructuring costs and similar items comprise the following:

(€ million)	June 30, 2019 (6 months)	June 30, 2018 (6 months)	December 31, 2018 (12 months)
Employee-related expenses	**667**	206	517
Expenses related to property, plant and equipment and to inventories	**39**	80	162
Compensation for early termination of contracts (other than contracts of employment)	**3**	4	352
Decontamination costs	**1**	–	5
Other restructuring costs	**37**	317	444
Total	**747**	607	1,480

Restructuring costs in the first half of 2019 mainly reflect employee-related expenses associated with headcount adjustment plans, mainly in Europe and the United States.

4.3.14 Issues, repurchases and repayments of debt and equity securities

Extract 41.15 below illustrates the disclosure of material changes in borrowings. *[IAS 34.16A(e)]*.

Extract 41.15: Anheuser-Busch InBev NV/SA (30 June 2019)

Notes to the unaudited condensed consolidated interim financial statements [extract]

16. Interest-bearing loans and borrowings [extract]

On 11 February 2019, the company completed the tender offers of twelve notes issued by Anheuser-Busch InBev Finance, Anheuser-Busch Companies, LLC ("ABC") and Anheuser-Busch InBev Worldwide Inc and repurchased 16.3 billion US dollar aggregate principal amount of these notes. [...]

These tender offers were financed with cash.

On 25 April 2019, the company redeemed outstanding principal amount of certain notes due in 2020 and 2023. The principal amount of the notes that were retired is approximately 2.3 billion US dollar. [...]

AB InBev's net debt was restated to reflect the impact of the adoption of IFRS 16 and amounted to 104.2 billion US dollar as of 30 June 2019 and 31 December 2018. Apart from operating results net of capital expenditures, the net debt is mainly impacted by the payment of interests and taxes (4.2 billion US dollar), settlement of derivatives (0.8 billion US dollar increase of net debt) and dividend payments to shareholders of AB InBev (2.4 billion US dollar). Net debt to normalized EBITDA was 4.61× for the 12-month period ending 31 December 2018 on a Restated base and 4.58× for the 12-month period ending 30 June 2019 on a Reference base.

Extract 41.16 below illustrates the disclosure of changes in treasury stock resulting from disposal of treasury stock through third-party allotment. *[IAS 34.16A(e)]*.

Extract 41.16: Nippon Telegraph and Telephone Corporation
(Quarterly Securities Report – The First Quarter of the 36th Business Term – From April 1, 2020 to June 30, 2020)

Condensed Consolidated Financial Statement [extract]

Notes to Condensed Consolidated Financial Statement [extract]

11. Equity and Other Equity Items [extract]

(1) Issued Shares and Treasury Stock

Reconciliation of the number of issued shares and treasury stock

(shares)

	Issued Shares	Treasury Stock
April 1, 2019	1,950,394,470	32,997,746
Purchase of treasury stock under resolution of the board of directors	–	99,763,016
Repurchase of treasury stock based on less-than-one-unit share purchase demand	–	47,564
Disposal of treasury stock based on additional less-than-one-unit share purchase demand	–	(4,246)
Increase by stock split	1,950,394,470	132,788,632
March 31, 2020	3,900,788,940	265,592,712
Repurchase of shares based on less-than-one-unit share purchase demand	–	6,996
Disposal of treasury stock based on additional less-than-one-unit share purchase demand	–	(3,152)
Disposal of treasury stock through third-party allotment	–	(80,775,400)
June 30, 2020	3,900,788,940	184, 821,156

Stock Split

NTT conducted a two-for-one stock split of its common stock, with a record date of December 31, 2019 and an effective date of January 1, 2020 based on the resolution at the meeting of board of directors on November 5, 2019.

Acquisition of Toyota Motor Corporation's Shares and Disposal of Treasury Stock by Way of Third-party Allotment

On March 24, 2020, the Board of Directors resolved that NTT would enter into a memorandum of understanding for a business and capital alliance (the "Alliance") with Toyota Motor Corporation ("Toyota") and entered into the Alliance on the same day. On April 9, 2020, Toyota and NTT mutually executed a comprehensive underwriting agreement for a third-party allotment of treasury stock of both parties based on the memorandum of understanding. NTT acquired Toyota's shares and conducted a disposition of shares of the NTT's treasury stock through the third-party allotment with Toyota as the subscriber for the shares on the same day.

Overview of a disposition of shares of the NTT's treasury stock through the third-party allotment, with Toyota as the subscriber for the shares

(1)	Disposition date	April 9, 2020
(2)	Type and number of shares disposed	80,775,400 shares of the NTT's common stock
(3)	Disposition price	¥2,476 per share
(4)	Amount of funds raised	¥199,999,890,400
(5)	Percentage to the total number of issued and outstanding shares held by Toyota	2.07% of the NTT's issued and outstanding common stock

4.3.15 *Dividends paid*

In the Extract below, Nestlé S.A. discloses dividends paid during the interim period. *[IAS 34.16A(f)]*.

Extract 41.17: Nestlé S.A. (Half-Year Report of the Nestlé Group 2019)

Notes [extract]
8. Equity [extract]
8.2 Dividend

The dividend related to 2018 was paid on April 17, 2019 in accordance with the decision taken at the Annual General Meeting on April 11, 2019. Shareholders approved the proposed dividend of CHF 2.45 per share, resulting in a total dividend of CHF 7230 million.

4.3.16 *Events after the interim reporting date*

In the Extract below, thyssenkrupp AG reports a major restructuring and conclusion of a credit line after the end of the interim period. *[IAS 34.16A(h)]*.

Extract 41.18: thyssenkrupp, AG (Interim report 1st half 2019/2020)

Condensed interim financial statements [extract]
Selected notes [extract]
14 Subsequent events

At the end of April 2020, thyssenkrupp decided on a major restructuring of the German sites of the Springs and Stabilizers business in the Automotive Technology business area. Under the restructuring plan, production of stabilizers at the Olpe site will be discontinued by the end of 2021. Production at the Hagen site is to be realigned. The restructuring will impact about 490 jobs, for which a reconciliation of interests and a social plan are to be agreed with the employee representatives in the coming weeks.

On May 8, 2020 thyssenkrupp concluded a credit line of €1 billion from the KfW special program with a consortium of KfW and other banks. The credit line will additionally secure liquidity during the coronavirus pandemic until the cash inflow from the sale of the Elevator Technology business area before the end of this fiscal year.

Although not an explicit requirement under IAS 34, it is useful to disclose the date on which the interim financial statements are authorised for issue as it helps the users to understand the context of any disclosure of events after the interim reporting date. *[IAS 10.17]*.

4.3.17 Changes in the composition of the entity

The notion of changes in the composition of the entity is broadly defined to include acquisitions, restructurings and discontinued operations. *[IAS 34.16A(i)]*.

In the Extract below, Nine Entertainment Co. Holdings Limited discloses change in group structure resulting from acquisitions including additional interest during the interim period.

Extract 41.19: Nine Entertainment Co. Holdings Limited (Financial report for the half year ended 31 December 2019)

Notes to the Consolidated Financial Statements for the half year ended 31 December 2019 [extract]

5. GROUP STRUCTURE [extract]

5.1. Business combinations and acquisition of non-controlling interests [extract]

5.1 (a) Information on current year acquisitions and disposals

Acquisition of additional interest in Macquarie Media Limited

During the period, the Group acquired the remaining 45.6% stake in Macquarie Media Limited which it did not already own, for a total consideration of $113.9 million, with the acquisition completed on 21 November 2019. The Group acquired the remainder of Macquarie Media Limited to consolidate its position as a supplier of news and current affairs across all of the Group's key platforms. Macquarie Media Limited has previously been consolidated into the Group's results as a result of the Fairfax merger on 7 December 2018 and therefore there was no change to the net assets recorded in relation to this entity as a result of the acquisition of the remaining 45.6% stake.

Acquisition of Bidtracker Holdings Pty Limited

On 27 November 2019, Domain acquired 100% of the share capital in Bidtracker Holdings Pty Ltd and its subsidiaries ("Bidtracker Group") which operates the business Real Time Agent. The consideration for the acquisition is to be paid in three tranches with two of the three being contingent on the future financial performance of the Real Time Agent business.

The first tranche included payment of $19.4 million which was settled in cash on 27 November 2019 and $0.5 million cash effective settlement of the intercompany loan. Tranches two and three are due to be settled in September 2020 and 2021 based on the performance against defined targets in FY20 and FY21 respectively. An additional amount between nil and $15.6 million in cash is payable; the maximum consideration for the transaction across the three tranches is $35.5 million, the expected consideration for the transaction is $24.5 million.

The contingent consideration for tranches two and three is recognised as a financial liability on the balance sheet and is measured at fair value through the profit and loss. The contingent consideration is recognised in accordance with AASB 132 Financial Instruments: Presentation as a financial liability as there is an obligation to deliver cash consideration, based upon the post acquisition financial performance of the combined business.

Provisional goodwill of $23.9 million was recognised at the time of acquisition. The goodwill comprises expected synergies arising from the acquisition.

AASB 3 Business Combinations allows a measurement period after a business combination to provide the acquirer a reasonable time to obtain the information necessary to identify and measure all of the various components of the business combination as of the acquisition date. The period cannot exceed one year from the acquisition date.

In the Extract below, Roche Holding Ltd discloses information on its ongoing significant restructuring activities. In addition, comparative amounts and further break-down of additional costs incurred are provided (not reproduced here).

Extract 41.20: Roche Holding Ltd (Half-Year Report 2020)

Notes to the Roche Group Interim Consolidated Financial Statements [extract]

7 Global restructuring plans [extract]

During the six months ended 30 June 2020 the Group continued with the implementation of various global restructuring plans initiated in prior years.

Global restructuring plans: costs incurred in millions of CHF

	Diagnostics	Site consolidation	Other plans	Total
Six months ended 30 June 2020				
Global restructuring costs				
– Employee-related costs	36	3	103	142
– Site closure costs	17	3	20	40
– Divestment of products and businesses	0	0	0	0
– Other reorganisation expenses	30	4	37	71
Total global restructuring costs	**83**	**10**	**160**	**253**
[...]				

Diagnostics Division. During the six months ended 30 June 2020 strategy plans in the Diagnostics Division incurred costs of CHF 45 million, mainly for employee-related costs.

Other global restructuring plans. During the six months ended 30 June 2020 initiatives for the outsourcing of IT and other functions to shared service centres and external providers incurred costs of CHF 66 million, mainly employee-related.

In the Extract below, Rolls-Royce Holdings plc describes the impact of its significant divestments.

Extract 41.21: Rolls-Royce Holdings plc (2019 Half Year Results)

Notes to the half-year financial statements [extract]

16 Acquisitions and disposals [extract]

Disposals

On the 1 April 2019, the Group completed the sale of its Commercial Marine business to KONGSBERG for £569m. The business was disclosed as held for sale from 30 June 2018. In our 2018 half year financial statements, we reported an impairment charge of £160m as a result of the decision to classify Commercial Marine as a business held for sale. Upon the disposal of Commercial Marine on 1 April 2019, and in accordance with IAS 21 *The Effects of Changes in Foreign Exchange Rates* we have recycled the cumulate currency translation reserve through the Income Statement in 2019. This has resulted in a cumulative currency translation gain of £98m. Under the Sale and Purchase Agreement, the cash consideration may be adjusted based upon finalisation of the net assets disposed of, expected to be concluded by 31 December 2019.

On the 15 April 2019, the Group sold its shareholding in Rolls-Royce Power Development Limited to Rockland Capital Partners for £29m. The principal activity of this company was to operate a fleet of six industrial Trent power stations in the UK.

	Total £m
Proceeds	
Cash consideration	598
Cash and cash equivalents disposed	(118)
Net cash consideration	480
Disposal costs paid	(22)
Cash inflow per cash flow statement	458
Assets and liabilities disposed	
Intangible assets	236
Property, plant and equipment	146
Right-of-use assets	40
Deferred tax assets	7
Inventory	210
Trade receivables and other assets	213
Current tax assets	1
Lease liabilities	(39)
Trade payables and other liabilities	(280)
Deposits (payments received on account)	(74)
Provisions for liabilities and charges	(28)
Post-retirement scheme deficits	(28)
Net assets disposed	404

The provisional gain of disposal of businesses (net of disposal costs) totalled £118m.

4.4 Segment information

If an entity is required to disclose segment information in its annual financial statements, certain segment disclosures are required in its interim financial report. IFRS 8 is discussed in more detail in Chapter 36.

An entity applying IFRS 8 in its annual financial statements should include the following information in its interim financial report about its reportable segments: *[IAS 34.16A(g)]*

(a) segment revenues from external customers (if included in the measure of segment profit or loss reviewed by or otherwise regularly provided to the chief operating decision maker);

(b) intersegment revenues (if included in the measure of segment profit or loss reviewed by or otherwise regularly provided to the chief operating decision maker);

(c) a measure of segment profit or loss;

(d) a measure of total assets and liabilities for a particular reportable segment if such amounts are regularly provided to the chief operating decision maker and if there has been a material change from the amount disclosed in the last annual financial statements for that reportable segment;

(e) a description of differences in the basis of segmentation or in the basis of measurement of segment profit or loss from the last annual financial statements; and

(f) a reconciliation of the total profit or loss for reportable segments to the entity's profit or loss before income taxes and discontinued operations. However, if an entity allocates such items as income taxes to arrive at segment profit or loss, the reconciliation can be to the entity's profit or loss after those items. The entity should separately identify and describe all material reconciling items.

In Extract 41.22 below, Daimler AG discloses segment revenues and segment profit or loss in its interim financial report for the second quarter of 2019. Presumably, information required by (d) above is not included because it is not applicable for the periods presented. In addition, the reconciliation to group figures is also provided for the full first half of 2018 (not reproduced here).

Extract 41.22: Daimler AG (Interim Report Q2 2019)

Notes to the Interim Consolidated Financial Statements [extract]

19. **Segment reporting** [extract]

Segment information for the three-month periods ended June 30, 2019 and June 30, 2018 is as follows:

E.26

Segment reporting for the three-month periods ended June 30

	Mercedes-Benz Cars	Daimler Trucks	Mercedes-Benz Vans	Daimler Buses	Daimler Financial Services	Total segments	Recon-ciliation	Daimler Group
In millions of euros								
Q2 2019								
External revenue	**21,437**	**9,998**	**3,435**	**1,237**	**6,543**	**42,650**	**–**	**42,650**
Intersegment revenue	**856**	**474**	**219**	**31**	**602**	**2,182**	**–2,182**	**–**
Total revenue	**22,293**	**10,472**	**3,654**	**1,268**	**7,145**	**44,832**	**–2,182**	**42,650**
Segment profit/loss (EBIT)	–672	725	–2.050	106	431	–1,460	–95	–1,555
thereof share of gains/losses on equity-method investments	304	–6	12	–	–125	185	25	210
thereof gains/losses on compounding and effects from changes in discount rates of provisions for other risks	–60	–22	–5	–2	–	–89	–	–89

Reconciliation
Reconciliation of the total segments' profit (EBIT) to profit before income taxes is as shown in table ↗ **E.28.**

The reconciliation comprises corporate items for which headquarters is responsible. Transactions between the segments are eliminated in the context of consolidation.

E.28

Reconciliation to Group figures [extract]	**Q2 2019**	Q2 2018
In millions of euros		
Total segments' profit (EBIT)	**–1,460**	2,731
Share of gains/losses on equity-method investments	**25**	26
Other corporate items	**–139**	–121
Eliminations	**19**	4
Group EBIT	**1.555**	2.640
Amortization of capitalized borrowing costs[1]	**–3**	–4
Interest income	**121**	70
Interest expense	**–235**	–176
Profit/loss before income taxes	**–1,672**	2,530

[1] Amortization of capitalized borrowing costs is not considered in the internal performance measure "EBIT",but is included in cost of sales.

4.5 Fair value disclosures for financial instruments

IAS 34 requires that an entity should include the following in its interim financial report in relation to financial instruments: *[IAS 34.16A(j)]*

(a) disclosures to help users of the financial statements assess the valuation techniques and inputs used to develop the fair value measurements used for financial instruments in the statement of financial position and, for financial instruments measured using unobservable inputs, the effect of those measurements on profit or loss or other comprehensive income in the period, *[IFRS 13.91]*, (see Chapter 14 at 20.1);

(b) certain disclosures for fair value measurements that are included in the statement of financial position after initial recognition, including the carrying amount, categorisation within the fair value hierarchy and additional disclosures for those not classified as level 1 (see Chapter 14 at 20.3); *[IFRS 13.93]*

(c) accounting policy disclosures relating to how the entity has determined appropriate classes of financial assets and liabilities for which information about fair value measurement is given; how it determined when transfers between levels of the fair value hierarchy have occurred; and how the entity has measured any groups of financial assets and liabilities managed on the basis of its net exposure (see Chapter 14 at 20.1.2.A and 20.2); *[IFRS 13.94-96]*

(d) disclosures regarding liabilities measured at fair value and issued with inseparable third-party credit enhancements (see Chapter 14 at 20.5); *[IFRS 13.98]* and

(e) disclosures about fair value required by IFRS 7, including for each class of financial asset and financial liability a comparison between fair value and carrying amount, unless the carrying amount is a reasonable approximation of the fair value, *[IFRS 7.25, 26, 29(a)]*, and disclosures relating to the deferral and subsequent recognition of gains and losses arising when fair value is determined using unobservable inputs or when the fair value of a discretionary participation feature within a contract cannot be determined reliably (see Chapter 54 at 4.5). *[IFRS 7.28, 29(c)]*.

Quantitative disclosures would normally be given in a tabular format unless another format is more appropriate. *[IFRS 13.99]*. The entity should assess whether the disclosures are sufficient to meet the disclosure objectives of IFRS 13. This requires judgements to be made about the level of detail; how much emphasis to place on each of the various requirements; and level of aggregation or disaggregation. If necessary, additional information should be given in order to meet those objectives (see Chapter 14 at 20.1). *[IFRS 13.92]*.

The Extract below from the half-year financial report of Nestlé S.A. illustrates disclosures related to the fair value hierarchy and valuation techniques used.

Extract 41.23: Nestlé S.A. (Half-Year Report of the Nestlé Group 2020)

Notes [extract]

9. Fair value of financial instruments [extract]

9.1 Fair value hierarchy [extract]

In millions of CHF	June 30, 2020	December 31, 2019
Derivative assets	33	135
Bonds and debt funds	1 774	573
Equity and equity funds	243	211
Other financial assets	12	3
Derivative liabilities	(92)	(22)
Prices quoted in active markets (Level 1)	**1 970**	**900**
Derivative assets	226	119
Bonds and debt funds	512	488
Equity and equity funds	203	248
Other financial assets	697	720
Derivative liabilities	(552)	(398)
Valuation techniques based on observable market data (Level 2)	1 086	1 177
Valuation techniques based on unobservable input (Level 3)	104	91
Total financial instruments at fair value	3 160	2 168

The fair values categorized in level 2 above were determined as follows:

- Derivatives are valued based on discounted contractual cash flows using risk adjusted discount rates and relying on observable market data for interest rates and foreign exchange rates; and
- The other level 2 investments are based on a valuation model derived from the most recently published observable financial prices for similar assets in active markets.

There have been no significant transfers between the different hierarchy levels in the 2020 and the 2019 interim periods.

4.6 Disclosure of compliance with IFRS

If an interim financial report complies with the requirements of IAS 34, this fact should be disclosed. Furthermore, an interim financial report should not be described as complying with IFRS unless it complies with all the requirements of International Financial Reporting Standards, *[IAS 34.19]*, a requirement similar to that found in IAS 1. *[IAS 1.16]*. Therefore, an entity would only provide a statement of compliance with IFRS (as opposed to IAS 34 alone) in its interim report if it prepared a complete set of interim financial statements.

Extract 41.24: BMW Group (Quarterly Report 30 June 2019)

Notes to the Group Financial Statements [extract]
Accounting Principles and Policies [extract]
01 Basis of preparation [extract]

The consolidated financial statements of Bayerische Motoren Werke Aktiengesellschaft (BMW Group Financial Statements or Group Financial Statements) at 31 December 2018 were drawn up in accordance with International Financial Reporting Standards (IFRS), as endorsed by the European Union (EU), and the supplementary requirements of § 315 e (1) of the German Commercial Code (HGB). The Interim Group Financial Statements (Interim Report) at 30 June 2019, which have been prepared in accordance with International Accounting Standard (IAS) 34 (Interim Financial Reporting), have been drawn up using, in all material respects, the same accounting methods as those utilised in the 2018 Group Financial Statements. Changes resulting from the first-time application of IFRS 16 are presented in →note 4. The BMW Group applies the option of publishing condensed group financial statements. All Interpretations issued by the International Financial Reporting Interpretations Committee (IFRIC) which were mandatory at 30 June 2019 have been applied. The Interim Report also complies with German Accounting Standard No. 16 (GAS 16) – *Interim Financial Reporting* – issued by the German Accounting Standards Committee e.V. (GASC).

When entities either choose or are required by local regulations to meet other requirements in addition to IAS 34, the statement of compliance can be more complicated. In Extract 41.24 above, BMW Group simply adds a statement confirming its compliance with the specific German Accounting Standard on interim reporting and the supplementary requirements of the German Commercial Code. Additional complexity can arise when the entity seeks to meet the requirements of its (IFRS-based) local GAAP as well as IFRS as issued by the IASB. Extract 41.25 below shows how the dual listed BHP Group disclosed compliance with IFRS, IFRS as endorsed by the EU, Australian Accounting Standards and the requirements of the Financial Conduct Authority in the UK.

Extract 41.25: BHP (Financial Report – Half year ended 31 December 2019)

Notes to the Financial Statements [extract]
1. **Basis of preparation** [extract]

This general purpose financial report for the half year ended 31 December 2019 is unaudited and has been prepared in accordance with IAS 34 ‘Interim Financial Reporting’ as issued by the International Accounting Standards Board (IASB) and as adopted by the European Union (EU), AASB 134 ‘Interim Financial Reporting’ as issued by the Australian Accounting Standards Board (AASB) and the Disclosure and Transparency Rules of the Financial Conduct Authority in the United Kingdom and the Australian Corporations Act 2001 as applicable to interim financial reporting.

The extract above also highlights a compliance issue for adopters of IFRS-based standards, such as entities in Australia and the European Union. Because of the time taken to secure local endorsement of IFRS issued by the IASB, an entity may not be able to state at a particular reporting date that the financial statements comply with both IFRS as issued by the IASB and IFRS as endorsed locally.

For example, when the Interpretations Committee issues an interpretation that is effective for the annual period which includes the current interim reporting period, entities may choose not to comply with IAS 34 (as issued by the IASB) in their interim financial statements rather than risk applying an interpretation in their full year financial statements that is not yet locally endorsed. Alternatively, an entity may publish interim financial information prepared under locally endorsed IFRS, for example, IFRS as adopted by the European Union. In such cases, the basis of preparation should state that IAS 34 is being applied in this context.

4.7 Disclosure in relation to the going concern assumption

Although IAS 34 does not specifically address the issue of going concern, the general requirements of IAS 1 apply to both a complete set and to condensed interim financial statements. *[IAS 1.4]*. IAS 1 states that when preparing financial statements, management assesses an entity's ability to continue as a going concern, and that the financial statements are prepared on a going concern basis unless management either intends to liquidate the entity or cease trading or has no realistic alternative but to do so. *[IAS 1.25]*. The going concern assessment is discussed in more detail in Chapter 3 at 4.1.2.

Under IAS 1, the assessment is made based on all available information about the future, which at a minimum is twelve months from the end of the reporting period. *[IAS 1.26]*. Therefore, with respect to interim reporting under IAS 34, the minimum period for management's assessment is also at least twelve months from the interim reporting date; it is not limited, for example, to one year from the date of the most recent annual financial statements. In fact, local stock market requirements and other regulations might set a longer minimum period over which management are required to assess entity's ability to continue as a going concern, for example to consider a minimum period of twelve months after the date of approval of the interim financial statements.

Example 41.3: Going concern assessment under IAS 1

An entity's financial year-end is 31 December (calendar year) and its annual financial statements as of 31 December 2020 are prepared on a going concern basis. In assessing the going concern assumption as at 31 December 2020, management considered all future available information through to 31 December 2021.

In preparing its quarterly interim financial statements (condensed or complete) as at 31 March 2021, management should evaluate all future available information to at least 31 March 2022.

If management becomes aware, in making its assessment, of material uncertainties related to events or conditions that may cast significant doubt upon the entity's ability to continue as a going concern, the entity should disclose those uncertainties in its interim financial statements. If the entity does not prepare financial statements on a going concern basis, it should disclose that fact, together with the basis on which it prepared the financial statements and the reason why the entity is not regarded as a going concern. *[IAS 1.25]*.

In its 2020 interim report, Vesuvius plc considers a period of at least twelve months after the date of approval of the interim financial statements, in accordance with local regulatory requirements.

Extract 41.26: Vesuvius plc (Half Year Results for the six months ended 30 June 2020)

Notes to the Condensed Group Financial Statements [extract]

1. **Basis of preparation** [extract]

1.3. **Going concern** [extract]

[,,,] The Directors have prepared cash flow scenarios for the Group for a period at least 12 months from the date of approval of the 2020 Interim Condensed Financial Statements. These forecasts reflect an assessment of current and future end-market conditions and their impact on the Group's future trading performance. The analysis undertaken includes a severe but plausible downside scenario which assumes no improvement in sales from the current level of activity during the entire forecast period. This downside scenario assumes a continuation of weak markets in 2020 in line with Q2 and a further 5% decline in sales in 2021 due to a weaker first quarter relative to Q1 2020. Even in this downside scenario, the forecasts show that the Group has significant headroom in terms of both available committed liquidity and required compliance with financial covenants.

On the basis of the exercise described above and the Group's available committed liquidity, the Directors consider that the Group and the Company have adequate resources to continue in operational existence for a period of at least 12 months from the date of signing of these Interim Condensed Financial Statements. Accordingly, they continue to adopt a going concern basis in preparing the Condensed Financial statements of the Group and the Company.

5 PERIODS FOR WHICH INTERIM FINANCIAL STATEMENTS ARE REQUIRED TO BE PRESENTED

Irrespective of whether an entity presents condensed or complete interim financial statements, the components of its interim reports should include information for the following periods: *[IAS 34.20]*

(a) statement of financial position as of the end of the current interim period and a comparative statement of financial position as of the end of the immediately preceding year;

(b) statements of profit or loss and other comprehensive income for the current interim period and cumulatively for the current year-to-date, with comparative statements of profit or loss and other comprehensive income for the comparable interim periods (current and year-to-date) of the immediately preceding year;

(c) statement of changes in equity cumulatively for the current year-to-date period, with a comparative statement for the comparable year-to-date period of the immediately preceding year; and

(d) statement of cash flows cumulatively for the current year-to-date, with a comparative statement for the comparable year-to-date period of the immediately preceding year.

An interim report may present for each period either a single statement of 'profit or loss and other comprehensive income', or separate statements of 'profit or loss' and 'comprehensive income'. *[IAS 1.10A, IAS 34.20(b)]*. The condensed statement of comprehensive income referred to at (b) above should be presented in a manner consistent with the entity's annual financial statements. Accordingly, if the entity presents a separate statement for items of profit or loss in its annual financial statements, it should present a separate condensed statement of profit or loss in the interim financial report. *[IAS 34.8A]*.

If an entity's business is highly seasonal, then the standard encourages reporting additional financial information for the twelve months up to the end of the interim period, and comparative information for the prior twelve-month period, in addition to the financial statements for the periods set out above. *[IAS 34.21]*.

The standard does not require an entity to present a statement of financial position as at the end of the comparable interim period. However, in practice many entities reporting under IFRS disclose this information, either on a voluntary basis, or due to local regulations. Similarly, many entities also present the income statement for the immediately preceding full year. Such presentation is allowed under IAS 34.

The examples below illustrate the periods that an entity is required to disclose under IAS 34. *[IAS 34.22, Illustrative examples part A]*. An entity is encouraged to present the periods illustrated below if the business is highly seasonal.

Example 41.4: Entity publishes interim financial reports half-yearly

If an entity's financial year ends on 31 December (calendar year), it should present the following financial statements (condensed or complete) in its half-yearly interim financial report as of 30 June 2021:

Half-yearly interim report	*End of the current interim period*	*End of the comparative interim period*	*Immediately preceding year-end*
	30/6/2021	30/6/2020	31/12/2020
Statement of financial position	●		●
Statement(s) of profit or loss and other comprehensive income			
– Current period and year-to-date (6 months) ending	●	●	
– 12 months ending	○	○	
Statement of changes in equity			
– Year-to date (6 months) ending	●	●	
– 12 months ending	○	○	
Statement of cash flows			
– Year-to-date (6 months) ending	●	●	
– 12 months ending	○	○	

● Required ○ Disclosure encouraged if the entity's business is highly seasonal

If an entity publishes a separate interim financial report for the final interim period (i.e. second half of its financial year), it presents the following financial statements (condensed or complete) in its second half-yearly interim financial report as of 31 December 2021:

Second half-yearly interim report	*End of the current interim period*	*End of the comparative interim period*
	31/12/2021	31/12/2020
Statement of financial position	●	●
Statement(s) of profit or loss and other comprehensive income		
– Current period (6 months) ending	●	●
– Year-to-date (12 months) ending	●	●
Statement of changes in equity		
– Year-to-date (12 months) ending	●	●
Statement of cash flows		
– Year-to-date (12 months) ending	●	●

● Required

Example 41.5: Entity publishes interim financial reports quarterly

If an entity's financial year ends on 31 December (calendar year), it should present the following financial statements (condensed or complete) in its quarterly interim financial reports for 2021:

First quarter interim report	*End of the current interim period*	*End of the comparative interim period*	*Immediately preceding year-end*
	31/3/2021	31/3/2020	31/12/2020
Statement of financial position	●		●
Statement(s) of profit or loss and other comprehensive income			
– Current period and year-to-date (3 months) ending	●	●	
– 12 months ending	○	○	
Statement of changes in equity			
– Year-to-date (3 months) ending	●	●	
– 12 months ending	○	○	
Statement of cash flows			
– Year-to-date (3 months) ending	●	●	
– 12 months ending	○	○	

● Required ○ Disclosure encouraged if the entity's business is highly seasonal

Second quarter interim report	*End of the current interim period*	*End of the comparative interim period*	*Immediately preceding year-end*
	30/6/2021	30/6/2020	31/12/2020
Statement of financial position	●		●
Statement(s) of profit or loss and other comprehensive income			
– Current period (3 months) ending	●	●	
– Year-to-date (6 months) ending	●	●	
– 12 months ending	○	○	
Statement of changes in equity			
– Year-to-date (6 months) ending	●	●	
– 12 months ending	○	○	
Statement of cash flows			
– Year-to-date (6 months) ending	●	●	
– 12 months ending	○	○	

● Required ○ Disclosure encouraged if the entity’s business is highly seasonal

Third quarter interim report	*End of the current interim period*	*End of the comparative interim period*	*Immediately preceding year-end*
	30/9/2021	30/9/2020	31/12/2020
Statement of financial position	●		●
Statement(s) of profit or loss and other comprehensive income			
– Current period (3 months) ending	●	●	
– Year-to-date (9 months) ending	●	●	
– 12 months ending	○	○	
Statement of changes in equity			
– Year-to-date (9 months) ending	●	●	
– 12 months ending	○	○	
Statement of cash flows			
– Year-to-date (9 months) ending	●	●	
– 12 months ending	○	○	

● Required ○ Disclosure encouraged if the entity’s business is highly seasonal

If an entity publishes a separate interim financial report for the final interim period (i.e. fourth quarter of its financial year), it presents the following financial statements (condensed or complete) in its fourth quarter interim financial report as of 31 December 2021:

Fourth quarter interim report	*End of the current interim period*	*End of the comparative interim period*
	31/12/2021	31/12/2020
Statement of financial position	●	●
Statement(s) of profit or loss and other comprehensive income		
– Current period (3 months) ending	●	●
– Year-to-date (12 months) ending	●	●
Statement of changes in equity		
– Year-to-date (12 months) ending	●	●
Statement of cash flows		
– Year-to-date (12 months) ending	●	●

● Required

5.1 Other comparative information

For entities presenting condensed financial statements under IAS 34, there is no explicit requirement that comparative information be presented in the explanatory notes. Nevertheless, where an explanatory note is required by the standard (such as for inventory write-downs, impairment provisions, segment revenues etc.) or otherwise determined to be needed to provide useful information about changes in the financial position and performance of the entity since the end of the last annual reporting period, *[IAS 34.15]*, it would be appropriate to provide information for each period presented. However, in certain cases it would be unnecessary to provide comparative information where this repeats information that was reported in the notes to the most recent annual financial statements. *[IAS 34.15A]*. For example, it would only be necessary to provide information about business combinations in a comparative period when there is a revision of previously disclosed fair values.

For entities presenting complete financial statements, whilst IAS 34 sets out the periods for which components of the interim report are included, it is less clear how these rules interact with IAS 1's requirement to report comparative information for all amounts in the financial statements. *[IAS 1.38]*. In our view, similar considerations discussed above in the case of condensed financial statements would also apply to complete set of interim financial statements.

Example 41.6: Disclosing movements on non-current assets in a complete set of interim financial statements

An entity preparing complete IFRS financial statements is required to reconcile the carrying amount at the beginning and end of the period showing movements during that period for both intangible assets and property, plant and equipment. *[IAS 38.118, IAS 16.73]*. Therefore, an entity presenting complete IFRS financial statements for the six months ended 30 June 2021 would disclose the movements in intangible assets and in property, plant and equipment between 1 January 2021 and 30 June 2021. In our view, the requirement for comparatives in IAS 1 requires the entity to reconcile movements during the comparative interim period, between 1 January 2020 and 30 June 2020, even though the entity is not required to present a statement of financial position as at 30 June 2020 (as shown in Example 41.4 above).

In addition to presenting comparative information for the corresponding interim period, it is suggested that entities preparing a complete set of interim financial statements also include information for the previous full year in the case of the statement of financial position, such as the required comparative information for the current interim period and reconciliations to the previous year-end statement of financial position. In Example 41.6 above, this requirement could be achieved by reconciling movements in non-current assets during the second six months of the previous year (between 1 July 2020 and 31 December 2020).

If an entity presents complete financial statements and restates comparative information (e.g. following a change in accounting policy, correction of an error, or reclassification) and this restatement is material, then the entity should present a third statement of financial position at the beginning of the earliest comparative period in its interim financial reporting accordance with IAS 1. *[IAS 1.10(f)]*. No such requirement applies in the case of an entity preparing a condensed set of interim financial statements, *[IAS 1.BC33]*, however, additional disclosures are required in the case of correction of prior period errors, *[IAS 34.15B(g)]*, or when accounting policies are changed, *[IAS 34.16A(a)]*, (see 4.3.11 above).

5.2 Length of interim reporting period

IAS 34 does not limit interim reporting to quarterly or half-yearly periods; an interim period may be any period shorter than a full year. *[IAS 34.4]*. Nevertheless, interim reporting for a period other than quarterly or half-yearly is not a common practice.

5.3 Change in financial year-end

The requirement in IAS 34 to present a comparative statement of profit or loss and other comprehensive income 'for the comparable interim periods (current and year-to-date) of the immediately preceding financial year', *[IAS 34.20]*, can give rise to diversity in practice in the case of an entity that changes its annual financial reporting date. For example, an entity changing its reporting date from 31 December to 31 March would change its half-yearly reporting date from 30 June to 30 September and therefore present its first half-yearly report after its new annual reporting date for the six-month period from 1 April to 30 September. A 'comparable' comparative interim period in this scenario could be taken to mean the six months ended 30 September in the prior year, as illustrated in Example 41.7 below.

Example 41.7: Entity changes financial year-end

An entity changes its financial year-end from 31 December (calendar year) to 31 March, and first reflects the change in its annual financial statements for the period ended 31 March 2021. It determines that the requirement for comparable comparative information in IAS 34 requires it to present the following financial statements (condensed or complete) in its half-yearly interim financial report for the six months ending 30 September 2021:

Half-yearly interim report	*End of the current interim period*	*End of the comparative interim period*	*Immediately preceding year-end*
	30/9/2021	30/9/2020	31/03/2021
Statement of financial position	●		●
Statement(s) of profit or loss and other comprehensive income			
– Current period and year-to-date (6 months) ending	●	●	
– 12 months ending	○	○	
Statement of changes in equity			
– Year-to date (6 months) ending	●	●	
– 12 months ending	○	○	
Statement of cash flows			
– Year-to-date (6 months) ending	●	●	
– 12 months ending	○	○	

● Required ○ Disclosure encouraged if the entity's business is highly seasonal

The entity in the example above did not show information for the half-year ended 30 June 2020 as the comparative period, notwithstanding the fact that this period would have been the reporting date for the last published half-yearly report.

Other interpretations of IAS 34 in this regard are also possible. As illustrated in the Extract below, Sirius Minerals changed its annual financial reporting period-end from March to December, which resulted in the company reporting on a shorter (nine-month) annual financial period ended 31 December 2015. For its next set of condensed interim financial statements (for the six months ended 30 June 2016), Sirius presented comparative information for the first six months of the previous annual financial period, being the six months ended 30 September 2015. The company have also included information for the previous annual reporting period (in this case the shortened nine-month period ended 31 December 2015), in common with many UK reporters who present comparative information for the previous annual reporting period in addition to the information required by IAS 34.

Extract 41.27: Sirius Minerals Plc (Interim ended June 2016)

Basis of Preparation [extract]

The condensed interim unaudited consolidated financial statements for the six-month period ended 30 June 2016 have been prepared in accordance with the Disclosure and Transparency Rules of the Financial Conduct Authority and with IAS 34 'Interim Financial Reporting' as adopted by the European Union ("EU"). As a result of changing the accounting reference date, from 31 March to 31 December, these financial statements should be read in conjunction with the condensed financial statements for the six-month period ended 30 September 2015 which have been prepared in accordance with IFRSs as adopted by the EU. Comparability with the current period is maintained due to the low seasonality of the Group's operations.

The accounting policies applied are consistent with those of the Group financial statements for the nine-month period ended 31 December 2015, which have also been voluntarily included in these financial statements for reference.

Given the lack of clarity in IAS 34 as to the meaning of 'comparable' in the case where the current financial year runs for a period that is different to 'the immediately preceding financial year', *[IAS 34.20]*, there are arguments to support each of the interpretations illustrated in Example 41.7 and Extract 41.27 above.

In the Extract above, Sirius Minerals noted that it had considered seasonality of its operations in determining whether the information presented for a prior interim period is comparable. The implication is that had it determined that operations were seasonal, the entity might have reported a different comparative period (perhaps for the six months ended 30 June 2015). As noted at 5 above and illustrated in Example 41.3, in cases where the entity's business is highly seasonal, IAS 34 encourages the reporting of additional financial information for the twelve months up to the end of the interim period, and comparative information for the prior twelve-month period, in addition to the financial statements for the periods set out above. *[IAS 34.21]*.

5.4 Comparatives following a financial period longer than a year

The discussion at 5.3 above demonstrates that when an entity changes its annual reporting date, the determination of comparative periods in the interim financial statements could be interpreted differently without definitive guidance in IAS 34.

Another situation where confusion may be caused by the requirement to present comparative information for 'the comparable interim periods (current and year-to-date) of the immediately preceding financial year', *[IAS 34.20]*, arises when the previous annual financial statements related to a period other than twelve months. This situation is not uncommon for a newly incorporated entity, which might have either a shorter or a longer reporting period in its first financial year.

Consider an entity that has a long initial accounting period of eighteen months and that is required to prepare interim financial reports on a quarterly basis. Accordingly, it would have six 'quarters' in its first financial reporting period and in line with the requirements of IAS 34, the entity would present statements of profit or loss and other comprehensive income, changes in equity and cash flows for each three-month period and cumulatively for the year-to-date. In the next financial year, however, the previously published year-to-date amounts would no longer be comparable. The following example illustrates this situation.

Example 41.8: Disclosing comparatives in interim financial statements when the preceding financial year covers a longer period

An entity's financial year-end is 31 December and it issues quarterly interim financial statements. It was incorporated on 1 July 2019 and prepared its first set of 'annual' financial statements for a period of eighteen months to 31 December 2020. In this period, the entity prepared interim financial statements under IAS 34 for each of the three-month periods ended 30 September 2019, 31 December 2019, 31 March 2020, 30 June 2020, 30 September 2020 and 31 December 2020. Each interim report contained information for the three-month period and the year-to-date, which started on 1 July 2019.

In the next year, a twelve-month annual reporting period, the entity is preparing its interim financial report for the three months (and half-year) ending 30 June 2021. Accordingly, it presents statements of profit or loss and other comprehensive income, changes in equity and cash flows for the three-month period from 1 April 2021 to 30 June 2021 and for the year-to-date (from 1 January 2021 to 30 June 2021). Under IAS 34, the entity is also required to present comparative statements of profit or loss and other comprehensive income, cash flows, and changes in equity for the comparable interim periods in the preceding financial year.

However, in its interim report for the three months ended 30 June 2020, i.e. in the prior financial year, the entity had presented information for the three month period from 1 April 2020 to 30 June 2020 as well as for the year-to-date period, from 1 July 2019 to 30 June 2020, which was then a period of twelve months.

The entity determines that the year-to-date comparative statements would cover the same period in the preceding year as the current year, which in this case would be for the three-month period from 1 April 2020 to 30 June 2020 and for the six-month period from 1 January 2020 to 30 June 2020.

It should be noted in the above example that none of the interim financial statements issued in the entity's first (eighteen month) reporting period would contain comparative information. In particular, no comparatives would be required for the three month periods ended 30 September 2020 and 31 December 2020 because the corresponding periods in the preceding calendar year (i.e. 30 September 2019 and 31 December 2019) actually form part of the same (eighteen month) financial period and therefore comparatives from a preceding financial reporting period did not exist.

5.5 When the comparative period is shorter than the current period

The same considerations apply when determining the comparable comparative period in the following circumstances when a newly incorporated entity's first financial year was less than twelve months.

Example 41.9: Disclosing comparatives in interim financial statements when the preceding financial year covers a shorter period

An entity was incorporated on 17 December 2020 and its equity shares were admitted to trading on a recognised stock market in April 2021. It determined that its annual reporting date will be 30 June each year and issued its first set of annual financial statements for the period ended 30 June 2021.

In compliance with the rules of the stock market, the entity issues its first half-yearly report for the six months ended 31 December 2021. This begs the question whether the comparative period for these interim financial statements would be the short period from 17 December 2020 (i.e. the date of incorporation) to 31 December 2020 or the first six months following the entity's incorporation, from 17 December 2020 to 16 June 2021.

As in Example 41.8 above, the entity could determine that the period-to-date comparative statements would cover the same period in the preceding annual reporting period as the current year, which in this case would be from 17 December 2020 to 31 December 2020. The entity should provide sufficient disclosure to explain the particular circumstances and the limited comparability with the current period.

6 MATERIALITY

In making judgements on recognition, measurement, classification, or disclosures in interim financial reports, the overriding goal in IAS 34 is to ensure that an interim financial report includes all information relevant to understanding an entity's financial position and performance during the interim period. *[IAS 34.25]*. The standard refers to IAS 1, which defines information as material if omitting, misstating or obscuring it could reasonably be expected to influence decisions that the primary users of general purpose financial statements make on the basis of those financial statements, which provide financial information about a specific reporting entity. *[IAS 1.7, IAS 34.24]*. However, IAS 34 notes that IAS 1 does not contain quantitative guidance on materiality. *[IAS 34.23]*. IAS 34 requires materiality to be assessed based on the interim period financial data. *[IAS 34.23]*.

Therefore, decisions on the recognition and disclosure of unusual items, changes in accounting policies or estimates, and errors are based on materiality in relation to the interim period figures to determine whether non-disclosure is misleading. *[IAS 34.25]*.

Neither the previous year's annual financial statements nor any expectations of the financial position at the current year-end are relevant in assessing materiality for interim reporting. However, the standard acknowledges that interim measurements may rely on estimates to a greater extent than measurements of annual financial data. *[IAS 34.23]*.

IFRS Practice Statement 2 – *Making Materiality Judgements* (Statement 2) is a non-mandatory statement and does not form part of IFRS. See Chapter 3 at 4.1.7 for a discussion on Statement 2.

Statement 2 includes guidance that specifically relates to materiality judgements for interim reporting. Whilst an entity considers the same materiality factors as in its annual assessment, it would also take into consideration the shorter time period and the different purpose of an interim financial report in the following respects:[2]

(a) assessing whether information in the interim financial report is material in relation to the interim period financial data, not annual data; *[IAS 34.25]*

(b) applying the materiality factors on the basis of both the current interim period data and also, whenever there is more than one interim period (e.g. in the case of quarterly reporting), the data for the current financial year to date; and

(c) considering whether to provide in the interim financial report information that is expected to be material to the annual financial statements. However, information that is expected to be material to the annual financial statements need not be provided in the interim financial report if it is not material to the interim financial report.

As regards purpose, the guidance suggests that entities should also have regard to the fact that an interim financial report is intended to provide an update on the latest complete set of annual financial statements. Information that is material to the interim period, but was already provided in the latest annual financial statements, does not need to be reproduced in the interim financial report, unless something new occurs or an update is needed. *[IAS 34.15, 15A]*.[3]

When an entity concludes that information about estimation uncertainty is material, it needs to disclose that information. As discussed at 10 below, measurements included in interim financial reports often rely more on estimates than measurements included in the annual financial statements. *[IAS 34.41]*. That fact does not, in itself, make the estimated measurements material. Nevertheless, relying on estimates for interim financial data to a greater extent than for annual financial data might result in more disclosures about such uncertainties being material, and thus being provided in the interim financial report, compared with the annual financial statements.[4]

7 DISCLOSURE IN ANNUAL FINANCIAL STATEMENTS

An estimate of an amount reported in an interim period can change significantly during the remainder of the year. An entity that does not present a separate interim financial report for its final interim period should disclose the nature and amount of significant changes in estimates in a note to the annual financial statements for that year. *[IAS 34.26]*. This disclosure requirement is intended to be narrow in scope, relating only to the change in estimate, and does not create a requirement to include additional interim period financial information in the annual financial statements. *[IAS 34.27]*.

The requirement to disclose significant changes in estimates since the previous interim reporting date is consistent with IAS 8 and paragraph 16A(d) of IAS 34. These standards require disclosure of the nature and the amount of a change in estimate that has a material effect in the current reporting period or is expected to have a material effect in subsequent periods. IAS 34 cites changes in estimate in the final interim period relating to inventory write-downs, restructurings, or impairment losses recognised in an earlier interim period as examples of items that are required to be disclosed. *[IAS 34.27]*.

8 RECOGNITION AND MEASUREMENT

The recognition and measurement requirements in IAS 34 arise mainly from the requirement to report the entity's financial position as at the interim reporting date, but also requires certain estimates and measurements to take into account the expected financial position of the entity at year-end, where those measures are determined on an annual basis (as in the case of income taxes). Many preparers misinterpret this approach as representing some form of hybrid of the discrete and integral methods to interim financial reporting. This can cause confusion in application and can lead to the accusation that IAS 34 seems internally inconsistent.

In requiring the year-to-date to be treated as a discrete period, IAS 34 prohibits the recognition or deferral of revenues and costs for interim reporting purposes unless such recognition or deferral is appropriate at year-end. As with a set of annual financial statements complying with IAS 8, IAS 34 requires changes in estimates and judgements reported in previous interim periods to be revised prospectively, whereas changes in accounting policies and errors are required to be recognised by prior period adjustment. However, IAS 34 sometimes allows looking beyond the interim reporting period, for example in estimating the tax rate to be applied on earnings for the period, when a year-to-date approach does not.

The recognition and measurement requirements of IAS 34 apply regardless of whether an entity presents a complete or condensed set of financial statements for an interim period, *[IAS 34.7]*, and are discussed below.

8.1 Same accounting policies as in annual financial statements

The principles for recognising assets, liabilities, income and expenses for interim periods are the same as in the annual financial statements. *[IAS 34.29]*. Accordingly, an entity uses the same accounting policies in its interim financial statements as in its most recent annual financial statements, adjusted for accounting policy changes that will be reflected in the next annual financial statements. However, IAS 34 also states that the frequency of an entity's reporting (annual, half-yearly or quarterly) does not affect the measurement of its annual results. To achieve that objective, measurements for interim reporting purposes are on a year-to-date basis. *[IAS 34.28]*.

8.1.1 Measurement on a year-to-date basis

Measurement on a year-to-date basis acknowledges that an interim period is a part of a full year and allows adjustments to estimates of amounts reported in prior interim periods of the current year. *[IAS 34.29]*.

This does not override the requirement that the principles for recognition and the definitions of assets, liabilities, income, and expenses for interim periods are the same as in annual financial statements. *[IAS 34.29]*. Therefore, for assets, the same tests of future economic benefits apply at interim dates as at year-end. Costs that, by their nature, would not qualify as assets at year-end, do not qualify for recognition at interim dates either. Similarly, a liability at the end of an interim reporting period must represent an existing obligation at that date, just as it must at the end of an annual reporting period. *[IAS 34.32]*. Under IAS 34, as under the IASB's *Conceptual Framework*, an essential characteristic of income and expenses is that the related inflows and outflows of assets and liabilities have already occurred. If those inflows or outflows have occurred, the related income and expense are recognised; otherwise they are not recognised. *[IAS 34.33]*.

The standard lists several circumstances that illustrate these principles:

- inventory write-downs, impairments, or provisions for restructurings are recognised and measured on the same basis as at a year-end. Except for reversal of impairment losses recognised on goodwill (see 9.2 below), later changes in the original estimate are recognised in the subsequent interim period, either by recognising additional accruals or reversals of the previously recognised amount; *[IAS 34.30(a)]*
- costs that do not meet the definition of an asset at the end of an interim period are not deferred in the statement of financial position, either to await information on whether such costs meets the definition of an asset, or to smooth earnings over interim periods within a year. *[IAS 34.30(b)]*. For example, costs incurred in acquiring an intangible asset before the recognition criteria under IAS 38 – *Intangible Assets* – are met are expensed. Only those costs incurred after the recognition criteria are met can be recognised as an asset; there is no reinstatement as an asset in a later period of costs previously expensed because the recognition criteria were not met at that time; *[IAS 38.71]* and
- income tax expense is 'recognised in each interim period based on the best estimate of the weighted-average annual income tax rate expected for the full financial year. Amounts accrued for income tax expense in one interim period may have to be adjusted in a subsequent interim period of that financial year if the estimate of the annual income tax rate changes'. *[IAS 34.30(c)]*.

Another example would be acquisition costs (excluding debt or share issue costs) incurred in relation to a business combination, which are required to be accounted as expenses in the periods in which the costs are incurred and the services are received. *[IFRS 3.53]*. Such costs would not qualify for deferral at an interim reporting date, even if the business combination to which the costs relate had not been completed until after the interim reporting date.

The year-to-date approach differs from the discrete approach in that the financial position and performance at each reporting date are evaluated not as an isolated period but as part of a cumulative period that builds up to a full year, whose results should not be influenced by interim reporting practices. Amounts reported for previous interim periods are not retrospectively adjusted, and therefore year-to-date measurements may involve changes in estimates of amounts reported in previous interim periods of the current year. As discussed at 4.2 and 7 above, IAS 34 requires disclosure of the nature and amount of material changes in previously reported estimates in the interim financial report and when separate interim financial report is not presented for the final interim period, in the full year financial statements. *[IAS 34.16A(d), 26, 34-36]*. However, the principle that the results of the full year should not be influenced by interim reporting practices, has been challenged, as the IASB and Interpretations Committee have identified and tried to resolve certain conflicts between IAS 34 and other standards, as discussed at 9.2 below.

8.1.2 New accounting pronouncements and other changes in accounting policies

As noted above, under IAS 34, an entity uses the same accounting policies in its interim financial statements as in its most recent annual financial statements, adjusted for accounting policy changes that will be in the next annual financial statements, and to determine measurements for interim reporting purposes on a year-to-date basis. *[IAS 34.28]*.

Unless transition rules are specified by a new standard or interpretation, IAS 34 requires a change in accounting policy to be reflected by: *[IAS 34.43]*

(a) restating the financial statements of prior interim periods of the current year and the comparable interim periods of any prior financial years that will be restated in the annual financial statements under IAS 8; or

(b) when it is impracticable to determine the cumulative effect at the beginning of the year of applying a new accounting policy to all prior periods, adjusting the financial statements of prior interim periods of the current year and comparable interim periods of prior years to apply the new accounting policy prospectively from the earliest date practicable.

Therefore, regardless of when in a financial year an entity decides to adopt a new accounting policy, it has to be applied from no later than the beginning of the current financial year. *[IAS 34.44]*. For example, if an entity that reports on a quarterly basis decides in its third quarter to change an accounting policy, it must restate the information presented in earlier quarterly financial reports to reflect the new policy as if it had been applied from the start of the annual reporting period.

The only exception to the restatement of all comparative periods is when it is impracticable to determine the cumulative effect of applying a new accounting policy at the beginning of the year of application. IAS 1 states that application of a requirement is 'impracticable' when the entity cannot apply it after making every reasonable effort to do so. *[IAS 1.7]*.

Disclosures regarding the restatement can be presented on the face of the financial statements or disclosed in the notes to the financial statements. Only if an entity prepares a complete set of interim financial statements, is it required to present a third statement of financial position, as appropriate (see 3.1 above). *[IAS 34.5(f)]*.

8.1.2.A New pronouncements becoming mandatory during the current year

One objective of the year-to-date approach is to ensure that a single accounting policy is applied to a particular class of transactions throughout a year. *[IAS 34.44]*. To allow accounting policy changes as of an interim date would mean applying different accounting policies to a particular class of transactions within a single year. This would make interim allocation difficult, obscure operating results, and complicate analysis and understandability of the interim period information. *[IAS 34.45]*.

Accordingly, when preparing interim financial information, consideration is given to which new standards and interpretations are mandatory in the next (current year) annual financial statements. The entity generally adopts these standards in all interim periods during that year.

For example, IFRS 16 was mandatory for annual periods beginning on or after 1 January 2019. *[IFRS 16.C1]*. Therefore, an entity with a 30 September year-end would have applied the standard in its half-yearly report for the six months ending 31 March 2020.

A change in accounting policy would require a restatement of prior comparative financial statements, except for new accounting standards that have specific application and transition requirements. *[IAS 34.43]*. For example, paragraph C5(b) of IFRS 16 allows an entity to apply the requirements in IFRS 16 without restating the prior comparative period (see Chapter 23 at 10.3.2).

8.1.2.B Voluntary changes of accounting policy

An entity can also elect at any time during a year to apply a new standard or interpretation before it becomes mandatory through a voluntary change in accounting policy. However, IAS 1 and IAS 8 only permit an entity to change an accounting policy if the information results in information that is 'reliable and more relevant' to the users of the financial statements. *[IAS 8.14(b)]*.

After concluding that a voluntary change in accounting policy is permitted and appropriate, its effect is reflected in the first interim report the entity presents after the date on which the entity changed its policy and prior interim periods are restated. Under IAS 8, a change in accounting policy is reflected by retrospective application, with restatement of prior period financial data as far back as is practicable. However, if the cumulative amount of the adjustment relating to previous financial years is impracticable to determine, then under IAS 8, the new policy is applied prospectively from the earliest date practicable. *[IAS 34.44]*. Under IAS 34, an entity is not allowed to reflect the effect of such a voluntary change in accounting policy from a later date than the beginning of the current year, such as at the start of the most recent interim period in which the decision was made to change the policy. *[IAS 34.44]*. To allow two different accounting policies to be applied to a particular class of transactions within a single year would make interim allocations difficult, obscure operating results, and complicate analysis and understandability of the interim period information. *[IAS 34.45]*.

One exception to this principle of retrospective adjustment of earlier interim periods is when an entity changes from the cost model to the revaluation model under IAS 16 – *Property, Plant and Equipment* – or IAS 38. These are not changes in accounting policy that are covered by IAS 8 in the usual manner, but instead required to be treated as a revaluation in the period. *[IAS 8.17]*. Therefore, the general requirements of IAS 34 do not override the specific requirements of IAS 8 to treat such changes prospectively.

However, to avoid using two differing accounting policies for a particular class of assets in a single financial year, consideration should be given to changing from the cost model to the revaluation model at the beginning of the financial year. Otherwise, an entity will end up depreciating assets based on cost for some interim periods and based on the revalued amounts for later interim periods.

8.1.2.C Transition disclosures in subsequent interim financial statements in the year of adoption

For an entity that prepares more than one set of interim financial statements during the year of adoption of a new standard (e.g. quarterly), it should provide information consistent with that which was disclosed in its first interim financial statements, but updated for the latest information. In some cases, the additional disclosures in a subsequent interim period only relate to the subsequent interim period as paragraph 16A of IAS 34 allows for cross-referencing to other documents available on the same terms. Entities should consider the views of local regulators when planning not to repeat in the current interim financial statements any disclosures already included in previous interim reports or other documents. That is because there are different views among regulators as to whether the policy and impact disclosures should be repeated in full in each set of interim financial statements issued during the year or whether cross-referencing to earlier interim financial statements or other documents outside the current interim report is acceptable. For example, in April 2018 the European Securities and Markets Authority (ESMA) published its report on the activities of accounting enforcers in 2017. In it, ESMA clarified that they expect issuers applying IFRS 15 for the first time and using a modified retrospective approach to provide the disclosures about transition required by paragraph C8 of IFRS 15 in all interim periods that include the date of initial application of IFRS 15.[5]

In any event, if an entity becomes aware of new information about the transitional impact of the new standards as at the date of initial application in a subsequent interim period, the previously reported disclosures will have to be updated in that later interim period to reflect the new information.

Local regulators may have additional requirements. For example, foreign private issuers reporting under IFRS that are required to file interim statements may be affected by the SEC's reporting requirement to provide both the annual and interim period disclosures prescribed by the new accounting standard, to the extent not duplicative, in each interim report in the year of adoption.[6]

8.1.2.D New pronouncements becoming mandatory in future annual reporting periods

There is no explicit requirement in IAS 34 for a condensed set of financial statements to include disclosures about standards and interpretations that take effect in future annual reporting periods. However, if an entity has obtained new information about the impact of issued but not yet effective amendments of IFRS, it should consider whether to include updated information in the condensed interim financial statements. An entity that prepares a complete set of interim financial statements has not applied a new IFRS that has been issued but is not yet effective must disclose information as required in paragraph 30 of IAS 8 (see Chapter 3 at 5.1.2).

8.1.3 Voluntary changes in presentation

In some cases, the presentation of the interim financial statements might be changed from that used in prior interim reporting periods. However, before changing the presentation used in its interim report from that of previous periods, management should consider the interaction of the requirements of IAS 34 to include in a set of condensed financial statements the same headings and sub-totals as the most recent annual financial statements, *[IAS 34.10]*, and to apply the same accounting policies as the most recent or the next annual financial report, *[IAS 34.28]*, and the requirements of IAS 1 as they will relate to those next annual financial statements. IAS 1 states that an entity should retain the presentation and classification of items in the financial statements, unless it is apparent following a significant change in the nature of operations or a review of the financial statements that another presentation is more appropriate, or unless the change is required by IFRS. *[IAS 1.45]*.

If a presentation is changed, the entity should also reclassify comparative amounts for both earlier interim periods of the current financial year and comparable periods in prior years. *[IAS 34.43(a)]*. In such cases, an entity should disclose the nature of the reclassifications, the amount of each item (or class of items) that is reclassified, and the reason for the reclassification. *[IAS 1.41, IAS 8.29]*.

8.2 Seasonal businesses

Some entities do not earn revenues or incur expenses evenly throughout the year, for example, agricultural businesses, holiday companies, domestic fuel suppliers, or retailers who experience peak demand at Christmas. The financial year-end is often chosen to fit their annual operating cycle, which means that an individual interim period would give little indication of annual performance and financial position.

An extreme application of the integral approach would suggest that they should predict their annual results and contrive to report half of that in the half-year interim financial statements. However, this approach does not portray the reality of their business in individual interim periods, and is, therefore, not permitted under the year-to-date approach adopted in IAS 34. *[IAS 34.28]*.

8.2.1 Revenues received seasonally, cyclically, or occasionally

The standard prohibits the recognition or deferral of revenues that are received seasonally, cyclically, or occasionally at an interim date, if recognition or deferral would not be appropriate at year-end. *[IAS 34.37]*. Examples of such revenues include dividend revenue, royalties, government grants, and seasonal revenues of retailers; such revenues are recognised when they occur. *[IAS 34.38]*.

IAS 34 also requires an entity to explain the seasonality or cyclicality of its business and the effect on interim reporting (see 4.3.12 above). *[IAS 34.16A(b)]*. If businesses are highly seasonal, IAS 34 encourages reporting of additional information for the twelve months up to the end of the interim period and comparatives for the prior twelve-month period (see 5 above). *[IAS 34.21]*.

8.2.2 Costs incurred unevenly during the year

IAS 34 prohibits the recognition or deferral of costs for interim reporting purposes if recognition or deferral of that type of cost is inappropriate at year-end, *[IAS 34.39]*, which is based on the principle that assets and liabilities are recognised and measured using the same criteria as at year-end. *[IAS 34.29, 31]*. This principle prevents smoothing of costs in seasonal businesses. Furthermore, the recognition of assets or liabilities at the interim date would not be appropriate if they would not qualify for recognition at the end of an annual reporting period. *[IAS 34. 32]*.

For direct costs, this approach has limited consequences, as the timing of recognising these costs and the related revenues is usually similar. However, for indirect costs, the consequences may be greater, depending on which standard an entity follows.

For example, manufacturing entities that use fixed production overhead absorption rates recognise an asset in respect of attributable overheads based on the normal capacity of the production facilities in accordance with IAS 2 – *Inventories*. Any variances and unallocated overheads are expensed. *[IAS 2.13]*. Entities applying IFRS 15 can only capitalise allocations of costs incurred in fulfilling a contract with a customer that are not within the scope of another standard which meet all the following criteria: *[IFRS 15.95]*

- the costs relate directly to the contract or to an anticipated contract that can be specifically identified;
- the costs are expected to generate or enhance resources of the entity that will be used in satisfying (or in continuing to satisfy) performance obligations in the future; and
- the costs are expected to be recovered.

If these criteria are not met at the reporting date, the costs are expensed.

The circumstances in which IFRS 15 allows an asset to be recognised in relation to costs incurred to fulfil a contract are discussed in Chapter 31 at 5.2. What is clear is that an entity should not diverge from these requirements for recognising an expense or an asset just because information is being prepared for an interim period.

9 EXAMPLES OF THE RECOGNITION AND MEASUREMENT PRINCIPLES

Part B of the illustrative examples accompanying the standard provides several examples that illustrate the recognition and measurement principles in interim financial statements. *[IAS 34.40]*. In addition, IFRIC 10 – *Interim Financial Reporting and Impairment* – addresses the reversal of impairment losses recognised on goodwill in the interim periods. These examples are discussed below.

9.1 Property, plant and equipment and intangible assets

9.1.1 Depreciation and amortisation

Depreciation and amortisation for an interim period is based only on assets owned during that interim period and does not consider asset acquisitions or disposals planned for later in the year. *[IAS 34.B24]*.

An entity applying a straight-line method of depreciation (amortisation) does not allocate the depreciation (amortisation) charge between interim periods based on the level of activity. However, under IAS 16 and IAS 38 an entity may use a 'unit of production' method of depreciation, which results in a charge based on the expected use or output (see Chapter 18 at 5.6.2). An entity can only apply this method if it most closely reflects the expected pattern of consumption of the future economic benefits embodied in the asset. The chosen method should be applied consistently from period to period unless there is a change in the expected pattern of consumption of those future economic benefits. *[IAS 16.62, IAS 38.98]*. Therefore, an entity cannot apply a straight-line method of depreciation in its annual financial statements, while allocating the depreciation charge to interim periods using a 'unit of production' based approach.

9.1.2 Impairment of assets

IAS 36 – *Impairment of Assets* – requires an entity to recognise an impairment loss if the recoverable amount of an asset declines below its carrying amount. *[IAS 34.B35]*. An entity should apply the same impairment testing, recognition, and reversal criteria at an interim date as it would at year-end. *[IAS 34.B36]*.

However, IAS 34 states that an entity is not required to perform a detailed impairment calculation at the end of each interim period. Rather, an entity should perform a review for indications of significant impairment since the most recent year-end to determine whether such a calculation is needed. *[IAS 34.B36]*. Nevertheless, the standard does not exempt an entity from performing impairment tests at the end of its interim periods. For example, an entity that recognised an impairment charge in the immediately preceding year, may find that it needs to update its impairment calculations at the end of subsequent interim periods because impairment indicators remain. IFRIC 10 does not allow reversal of impairment loss recognised on goodwill in a previous interim period (see 9.2 below).

9.1.3 Recognition of intangible assets

An entity should apply the same IAS 38 definitions and recognition criteria for intangible assets in an interim period as in an annual period. Therefore, costs incurred before the recognition criteria are met should be recognised as an expense. *[IAS 34.B8]*. Expenditures on intangibles that are initially expensed under IAS 38 cannot be reinstated and recognised as part of the cost of an intangible asset subsequently (e.g. in a later interim period). *[IAS 38.71]*. Furthermore, 'deferring' costs as assets in an interim period in the hope that the recognition criteria will be met later in the year is not permitted. Only costs incurred after the specific point in time at which the criteria are met should be recognised as part of the cost of an intangible asset. *[IAS 34.B8]*.

9.1.4 Capitalisation of borrowing costs

An entity that recognises finance expenses in the cost of a qualifying asset under IAS 23 – *Borrowing Costs* – should determine the amount to be capitalised from the actual finance cost during the period (when funds are specifically borrowed) *[IAS 23.12]* or, when the asset is funded out of general borrowings, by applying a capitalisation rate equal to the weighted-average of the finance costs attributable to actual borrowings outstanding during the period *[IAS 23.14]* (see Chapter 21 at 5.2 and 5.3). For interim financial reporting, measurement should be made on a year-to-date basis, *[IAS 34.28]*, regardless of how often the entity issues interim reports during a year. For example, an entity that issues quarterly interim reports would have to revise its estimated capitalisation rate in successive quarters during the same year for changes in actual year-to-date borrowings and finance costs. As required in IAS 34, the cumulative effect of changes in the estimated capitalisation rate should be recognised in the current quarter (as a change in estimate) and not retrospectively. *[IAS 34.36]*.

9.2 Reversal of impairment losses recognised in a previous interim period (IFRIC 10)

The two requirements in IAS 34, to apply the same accounting policies in interim financial reports as are applied for the annual financial statements, and to use year-to-date measurements for interim reporting purposes, do not sit easily together when considering the reversal of certain impairments that IFRS does not allow to be reversed in a subsequent period. For example, IAS 36 prohibits the reversal in a subsequent period of an impairment loss recognised for goodwill. *[IAS 36.124]*.

As discussed at 9.1.2 above, the requirement to use the same accounting policies means that an entity should apply the same impairment testing, recognition, and reversal criteria at the end of an interim period as it would at year-end. *[IAS 34.B36]*.

However, the use of year-to-date measurements implies that the calculation of impairments as at interim reporting dates in the same annual reporting period should be based on conditions as at the end of each interim period and determined independently of assessments at earlier interim dates. Applying this requirement of IAS 34 would lead to reversals of previously reported impairments if conditions change and justify a higher carrying value for the related asset.

IFRIC 10 addresses the interaction between the requirements of IAS 34 and the recognition of impairment losses on goodwill in IAS 36, and the effect of that interaction on subsequent interim and annual financial statements. *[IFRIC 10.2]*.

Whilst it may be unlikely for the conditions causing an impairment of goodwill at an interim date to reverse before year-end, IFRIC 10 states that the specific requirements of IAS 36 take precedence over the more general statement in IAS 34. *[IFRIC 10.BC9]*. As such, IFRIC 10 prohibits the reversal of an impairment loss recognised in a previous interim period in respect of goodwill. *[IFRIC 10.8]*.

Thus, in the albeit unlikely event that the conditions giving rise to an impairment do reverse in successive interim periods, there can be situations where two entities facing an identical set of circumstances, yet with different frequency of interim reporting, could end up reporting different annual results.

IFRIC 10 should not be applied by analogy to derive a general principle that the specific requirements of a standard take precedence over the year-to-date approach in IAS 34. *[IFRIC 10.9]*.

9.3 Employee benefits

9.3.1 Employer payroll taxes and insurance contributions

If employer payroll taxes or contributions to government sponsored insurance funds are assessed on an annual basis, the employer's related expense should be recognised in interim periods using an estimated average annual effective rate, even if it does not reflect the timing of payments. A common example contained in Appendix B to IAS 34 is employer payroll tax or insurance contribution subject to a certain maximum level of earnings per employee. Higher income employees would reach the maximum income before year-end, and the employer would make no further payments for the remainder of the year. *[IAS 34.B1]*.

9.3.2 Year-end bonuses

The nature of year-end bonuses varies widely. Some bonus schemes only require continued employment whereas others require certain performance criteria to be attained on a monthly, quarterly, or annual basis. Payment of bonuses may be purely discretionary, contractual or based on years of historical precedent. *[IAS 34.B5]*. A bonus is recognised for interim reporting only if: *[IAS 34.B6]*

(a) the entity has a present legal or constructive obligation to make such payments as a result of past events; and

(b) a reliable estimate of the obligation can be made.

A present obligation exists only when an entity has no realistic alternative but to make the payments. *[IAS 19.19]*. IAS 19 gives guidance on accounting for profit sharing and bonus plans (see Chapter 35 at 12.3).

In recognising a bonus at an interim reporting date, an entity should consider the facts and circumstances under which the bonus is payable and determine an accounting policy that recognises an expense reflecting the obligation on the basis of the services received to date. Several possible accounting policies are illustrated in Example 41.10 below.

Example 41.10: Measuring interim bonus expense

An entity pays an annual performance bonus if earnings exceed £10 million, under which 5% of any earnings in excess over £10 million will be paid up to a maximum of £500,000. Earnings for the six months ended 30 June 2021 are £7 million, and the entity expects earnings for the full year ended 31 December 2021 to be £16 million.

The following table shows various accounting policies and the expense recognised thereunder in the interim financial statements for the six months ended 30 June 2021.

	Expense (£)
Method 1 – constructive obligation exists when earnings target is met	Nil
Method 2 – assume earnings for remainder of year will be same	200,000
Method 3 – proportionate recognition based on full-year estimate	131,250
Method 4 – one-half recognition based on full-year estimate	150,000

Method 1 is generally not appropriate, as this method disregards the fact that the entity has a present obligation under the performance bonus arrangement when the employees have provided services during the first six months towards earning the bonus.

Likewise, Method 2 is generally not appropriate, as the expense of £200,000 [(£14 million – £10 million) × 5%] assumes that the employees will continue to provide services in the latter half of the year to achieve the bonus target, but does not attribute any services to that period.

In contrast to Methods 1 and 2, Method 3 illustrates an accounting policy whereby an estimate is made of the full-year expense and attributed to the period based on the proportion of that bonus for which employees have provided services at 30 June 2021. The amount recognised is calculated as (£7 million ÷ £16 million) × [5% × (£16 million – £10 million)].

Similar to Method 3, Method 4 also takes the approach of recognising an expense based on the full year estimate, but allocates that full-year estimate equally to each period (which is similar to the approach used for share-based payment transactions). The amount recognised is calculated as [50% × 5% × (£16 million – £10 million)].

In addition to Methods 3 and 4, which might be appropriate, depending on the facts and circumstances, an entity might determine another basis on which to recognise bonus that considers both the constructive obligation that exists as of 30 June 2021, and the services performed to date, which is also appropriate.

9.3.3 Pensions

Pension costs for an interim period are calculated on a year-to-date basis using the actuarially determined pension cost rate at the end of the prior year, adjusted for significant market fluctuations and for significant one-off events, such as plan amendments, curtailments and settlements. *[IAS 34.B9]*.

In the absence of such significant market fluctuations and one-off events, the estimate of the actuarial liabilities is rolled forward in the scheme based on assumptions as at the beginning of the year and adjusted for significant changes in the membership of the scheme. If there are significant changes to pension arrangements during the interim period (such as changes resulting from a material business combination or from a major redundancy programme) consideration should be given to obtaining a new actuarial valuation of scheme liabilities. Similarly, if there are significant market fluctuations, such as those arising from changes in corporate bond markets, the validity of the assumptions in the last actuarial estimate, such as the discount rate applied to scheme liabilities, should be reviewed and revised as appropriate.

In Extract 41.28 below International Consolidated Airlines Group S.A. discloses changes in the discount rates used for pension obligations. In normal circumstances, companies would not necessarily go through the full process of measuring pension liabilities at interim reporting dates, but rather would look to establish a process to assess the impact of any changes in underlying parameters (e.g. through extrapolation). If, for example, the discount rate estimated based on circumstances prevalent at the half-year interim reporting date has changed, the following 'rule of thumb' may help assess the impact on the pension obligation:

- Estimated change in DBO (%) = [Change in the discount rate (basis points) × duration of the pension obligation (in years)] ÷ 100

(Note: Basis points = 0.01%)

As with all approximations, the appropriateness in the circumstances should be considered.

Extract 41.28: International Consolidated Airlines Group, S.A. (Six months to June 30, 2019)

NOTES TO THE ACCOUNTS [extract]
15. EMPLOYEE BENEFIT OBLIGATIONS [extract]

The principal funded defined benefit pension schemes within the Group are the Airways Pension Scheme ('APS') and the New Airways Pension Scheme ('NAPS').

[...]

At 30 June 2019, the assumptions used to determine the obligations under the APS and NAPS were reviewed and updated to the reflect market condition at that date. Key assumptions were as follows:

	June 30,2019		December 31, 2018	
Per cent per annum	APS	NAPS	APS	NAPS
Inflation (CPI)	2.25	2.15	2.10	2.05
Inflation (RPI)	3.25	3.15	3.20	3.15
Salary increases (as RPI)	3.25	n/a	3.20	n/a
Discount rate	2.15	2.35	2.65	2.85

Further information on the basis of the assumptions is included in note 30 of the Annual Report and Accounts for the year to December 31, 2018.

9.3.4 Vacations, holidays, and other short-term paid absences

IAS 19 distinguishes between accumulating and non-accumulating paid absences. *[IAS 19.13]*. Accumulating paid absences are those that are carried forward and can be used in future periods if the current period's entitlement is not used in full. IAS 19 requires an entity to measure the expected cost of and obligation for accumulating paid absences at the amount the entity expects to pay as a result of the unused entitlement that has accumulated at the end of the reporting period (see Chapter 35 at 12.2.1). IAS 34 requires the same principle to be applied at the end of interim reporting periods. Conversely, an entity should not recognise an expense or liability for non-accumulating paid absences at the end of an interim reporting period, just as it would not recognise any at the end of an annual reporting period. *[IAS 34.B10]*.

9.4 Inventories and cost of sales

9.4.1 Inventories

The recognition and measurement principles of IAS 2 are applied in the same way for interim financial reporting as for annual reporting purposes. At the end of a financial reporting period an entity would determine inventory quantities, costs, and net realisable values. However, IAS 34 does comment that to save cost and time, entities often use estimates to measure inventories at interim dates to a greater extent than at annual reporting dates. *[IAS 34.B25]*.

Net realisable values are determined using selling prices and costs to complete and dispose at the end of the interim period. A write-down should be reversed in a subsequent interim period only if it would be appropriate to do so at year-end (see Chapter 22 at 3.3). *[IAS 34.B26]*.

9.4.2 *Contractual or anticipated purchase price changes*

Both the payer and the recipient of volume rebates, or discounts and other contractual changes in the prices of raw materials, labour, or other purchased goods and services should anticipate these items in interim periods if it is probable that these have been earned or will take effect. However, discretionary rebates and discounts should not be recognised because the resulting asset or liability would not meet the recognition criteria in the IASB's *Conceptual Framework*. *[IAS 34.B23]*.

9.4.3 *Interim period manufacturing cost variances*

Price, efficiency, spending, and volume variances of a manufacturing entity should be recognised in profit or loss at interim reporting dates to the same extent that those variances are recognised at year-end. It is not appropriate to defer variances expected to be absorbed by year-end, which could result in reporting inventory at the interim date at more or less than its actual cost. *[IAS 34.B28]*.

9.5 Taxation

Taxation is one of the most difficult areas of interim financial reporting, primarily because IAS 34 does not clearly distinguish between current income tax and deferred tax, referring only to 'income tax expense'. This causes tension between the approach for determining the expense and the asset or liability in the statement of financial position. In addition, the standard's provisions combine terminology, suggesting an integral approach to measurement with guidance requiring a year-to-date basis to be applied in respect of recognition. The integral method appears to be the basis used in determining the effective income tax rate for the whole year, but that rate is applied to year-to-date profit in the interim financial statements. In addition, under a year-to-date basis, the estimated rate is based on tax rates and laws that are enacted or substantively enacted by the end of the interim period. Changes in legislation expected to occur before the end of the current year are not recognised in preparing the interim financial report. The assets and liabilities in the statement of financial position, at least for deferred taxes, are derived solely from a year-to-date approach, but sometimes the requirements of the standard are unclear, as discussed below.

9.5.1 *Measuring interim income tax expense*

IAS 34 states that income tax expense should be accrued using the 'best estimate of the weighted average annual income tax rate expected for the full financial year' and applying that rate to actual pre-tax income for the interim period. *[IAS 34.30(c), B12]*. Whilst the standard also describes this rate as 'the tax rate that would be applicable to expected total annual earnings', *[IAS 34.B12]*, this is not the same as estimating the total tax expense for the year and allocating a proportion of that to the interim period (even though it might sometimes appear that way), as demonstrated in the discussion below.

Because taxes are assessed on an annual basis, using this approach to determine the annual effective income tax rate and applying it to year-to-date actual earnings is consistent with the basic concept in IAS 34, that the same recognition and measurement principles apply in interim financial reports as in annual financial statements. *[IAS 34.B13]*.

In estimating the weighted-average annual income tax rate, an entity should reflect a blend of any progressive tax rate structure expected to be applicable to the full year's earnings, including changes in income tax rates scheduled to take effect later in the year that are enacted or substantively enacted as at the end of the interim period. *[IAS 34.B13]*. This situation is illustrated in Example 41.11 below. *[IAS 34.B15]*.

Example 41.11: Measuring interim income tax expense – progressive tax rates

An entity reporting quarterly expects to earn 10,000 pre-tax each quarter and operates in a jurisdiction with a tax rate of 20% on the first 20,000 of annual earnings and 30% on all additional earnings. Actual earnings match expectations. The following table shows the income tax expense reported each quarter:

	Pre-tax earnings	Effective tax rate	Tax expense
First quarter	10,000	25%	2,500
Second quarter	10,000	25%	2,500
Third quarter	10,000	25%	2,500
Fourth quarter	10,000	25%	2,500
Annual	40,000		10,000

10,000 of tax is expected to be payable for the full year on 40,000 of pre-tax income (20,000 @ 20% + 20,000 @ 30%), implying an average annual effective income tax rate of 25% (10,000 ÷ 40,000).

In the above example, it might look as if the interim income tax expense is calculated by dividing the total expected tax expense for the year (10,000) by the number of interim reporting periods (4). However, this is only the case in this example because profits are earned evenly over each quarter. The expense is actually calculated by determining the effective annual income tax rate and multiplying that rate to year-to-date earnings, as illustrated in Example 41.12 below. *[IAS 34.B16]*.

Example 41.12: Measuring interim income tax expense – quarterly losses

An entity reports quarterly, earns 15,000 pre-tax profit in the first quarter but expects to incur losses of 5,000 in each of the three remaining quarters (thus having zero income for the year), and operates in a jurisdiction in which its standard statutory annual income tax rate is 20%. The following table shows the income tax expense reported each quarter:

	Pre-tax earning	Effective tax rate	Tax expense
First quarter	15,000	20%	3,000
Second quarter	(5,000)	20%	(1,000)
Third quarter	(5,000)	20%	(1,000)
Fourth quarter	(5,000)	20%	(1,000)
Annual	0		0

The above example shows how an expense is recognised in periods reporting a profit and a credit is recognised when a loss is incurred. This result is very different from allocating a proportion of the expected total income tax expense for the year, which in this case is zero.

If an entity operates in a number of tax jurisdictions, or where different income tax rates apply to different categories of income (such as capital gains or income earned in particular industries), the standard requires that to the extent practicable, an entity: *[IAS 34.B14]*

- estimates the average annual effective income tax rate for each taxing jurisdiction separately and apply it individually to the interim period pre-tax income of each jurisdiction; and
- applies different income tax rates to each individual category of interim period pre-tax income.

This means that the entity should perform the analysis illustrated in Example 41.11 above for each tax jurisdiction and arrive at an interim tax charge by applying the tax rate for each jurisdiction to actual earnings from each jurisdiction in the interim period. However, the standard recognises that, whilst desirable, such a degree of precision may not be achievable in all cases and allows using a weighted-average rate across jurisdictions or across categories of income, if such rate approximates the effect of using rates that are more specific. *[IAS 34.B14]*.

Example 41.13: Measuring interim tax expense – many jurisdictions

An entity operates in 3 countries, each with its own tax rates and laws. In order to determine the interim tax expense, the entity determines the effective annual income tax rate for each jurisdiction and applies those rates to the actual earnings in each jurisdiction, as follows:

(All values in €)	Country A	Country B	Country C	Total
Expected annual tax rate	25%	40%	20%	
Expected annual earnings	300,000	250,000	200,000	750,000
Expected annual tax expense	75,000	100,000	40,000	215,000
Actual half-year earnings	140,000	80,000	150,000	370,000
Interim tax expense	35,000	32,000	30,000	97,000

By performing a separate analysis for each jurisdiction, the entity determines an interim tax expense of €97,000, giving an effective average tax rate of 26.2% (€97,000 ÷ €370,000). Had the entity used a weighted-average rate across jurisdictions, using the expected annual earnings, it would have determined an effective tax rate of 28.7% (€215,000 ÷ €750,000), resulting in a tax expense for the interim period of €106,190 (370,000 @ 28.7%). Whether the difference of nearly €9,000 lies within the range for a reasonable approximation is a matter of judgement.

9.5.2 Changes in the effective tax rate during the year

9.5.2.A Enacted changes for the current year that apply after the interim reporting date

As noted above, the estimated income tax rate applied in the interim financial report should reflect changes that are enacted or substantively enacted as at the end of the interim reporting period, but scheduled to take effect later in the year. *[IAS 34.B13]*. IAS 12 – *Income Taxes* – acknowledges that in some jurisdictions, announcements by government have substantively the same effect as enactment. *[IAS 12.48]*. Accordingly, an entity should determine the date on which a change in tax rate or tax law is substantively enacted based on the specific constitutional arrangements of the jurisdiction.

For example, assume that the 30% tax rate (on earnings above 20,000) in Example 41.11 was substantively enacted as at the second quarter reporting date and applicable before year-end. In that case, the estimated income tax rate for interim reporting would be the same as the estimated average annual effective income tax rate computed in that example (i.e. 25%) after considering the higher rate, even though the entity's earnings are not above the required threshold at the half-year.

If legislation is enacted only after the end of the interim reporting period but before the date of authorisation for issue of the interim financial report, its effect is disclosed as an event after the interim period that has not been reflected in the financial statements for the interim period. *[IAS 34.16A(h)]*. This is consistent with the requirement under IAS 10 – *Events after the Reporting Period* – where estimates of tax rates and related assets or liabilities are not revised in these circumstances. *[IAS 10.22(h)]*.

9.5.2.B Changes to previously reported estimated income tax rates for the current year

IAS 34 requires an entity to re-estimate at the end of each interim reporting period the estimated average annual income tax rate on a year-to-date basis. *[IAS 34.B13]*. Accordingly, the amounts accrued for income tax expense in one interim period may have to be adjusted in a subsequent interim period if that estimate changes. *[IAS 34.30(c)]*. IAS 34 requires disclosure in interim financial statements of material changes in estimates of amounts reported in an earlier period or, in the annual financial statements, of material changes in estimates of amounts reported in the latest interim financial statements. *[IAS 34.16A(d), 26]*.

Accordingly, just as the integral approach does not necessarily result in a constant tax charge in each interim reporting period, it also does not result in a constant effective tax rate when circumstances change. In 2019, Coca-Cola HBC AG described how its tax rate is estimated in their interim report.

Extract 41.29: Coca-Cola HBC AG
(Half-yearly financial report for the six months ended 28 June 2019)

Selected explanatory notes to the condensed consolidated interim financial statements (unaudited) [extract]

6. Tax [extract]

The Group's effective tax rate for 2019 may differ from the theoretical amount that would arise using the weighted average tax rate applicable to profits of the consolidated entities. This difference can be a consequence of a number of factors, the most significant of which are the application of statutory tax rates of the countries in which the Group operates, the non-deductibility of certain expenses, the non-taxable income and one off tax items.

Example 41.14: Changes in the effective tax rate during the year

Taking the fact pattern in Example 41.11 above, an entity reporting quarterly expects to earn 10,000 pre-tax each quarter; from the start of the third quarter the higher rate of tax on earnings over 20,000 increases from 30% to 40%. Actual earnings continue to match expectations. The following table shows the income tax expense reported in each quarter:

	Period pre-tax earnings	Pre-tax earnings: year to date	Effective tax rate	Tax expense: year to date	Period tax expense
First quarter †	10,000	10,000	25%	2,500	2,500
Second quarter †	10,000	20,000	25%	5,000	2,500
Third quarter	10,000	30,000	30%	9,000	4,000
Fourth quarter	10,000	40,000	30%	12,000	3,000
Annual	40,000				12,000

† As previously reported from Example 41.11 using an effective tax rate of 25%.

The increase in the tax rate means that 12,000 of tax is expected to be payable for the full year on 40,000 of pre-tax income (20,000 @ 20% + 20,000 @ 40%), implying an average annual effective income tax rate of 30% (12,000 / 40,000). With cumulative pre-tax earnings of 30,000 as at the end of the third quarter, the estimated tax liability is 9,000, requiring a tax expense of 4,000 (9,000 – 2,500 – 2,500) to be recognised during that quarter. In the final quarter, earnings of 10,000 results in a tax charge of 3,000 using the revised effective rate of 30%.

9.5.2.C Enacted changes applying only to subsequent years

In many jurisdictions, tax legislation is enacted that takes effect not only after the interim reporting date but also after year-end. Such circumstances are not addressed explicitly in the standard. As IAS 34 does not clearly distinguish between current income tax and deferred tax, combined with the different approaches taken in determining the expense recognised in profit or loss compared to the statement of financial position, these issues can lead to confusion in this situation.

On the one hand, the standard states that the estimated income tax rate for the interim period includes enacted or substantively enacted changes scheduled to take effect later in the year. *[IAS 34.B13]*. This implies that the effect of changes that do not take effect in the current year is ignored in determining the appropriate rate for current tax. On the other hand, IAS 34 also requires that the principles for recognising assets, liabilities, income and expenses for interim periods are the same as in the annual financial statements. *[IAS 34.29]*. In annual financial statements, deferred tax is measured at the tax rates expected to apply to the period when the asset is realised or the liability is settled, based on tax rates (and tax laws) enacted or substantively enacted by the end of the reporting period, as required by IAS 12. *[IAS 12.47]*. Therefore, an entity should recognise the effect on deferred tax measurement of a change applying to future periods if enacted by the end of the interim reporting period.

These two requirements seem to be mutually incompatible. IAS 34 makes sense only in the context of calculating the effective current tax rate on income earned in the period. Once a deferred tax asset or liability is recognised, it should be measured under IAS 12. Therefore, an entity should recognise an enacted change applying to future years in measuring deferred tax assets and liabilities as at the end of the interim reporting period. One way to treat the cumulative effect to date of this remeasurement is to recognise it in full, by a credit to profit or loss or to other comprehensive income, depending on the nature of the temporary difference being remeasured, in the period during which the tax legislation is enacted, in a similar way to the treatment shown in Example 41.14 above, and as illustrated in Example 41.15 below.

Example 41.15: Enacted changes to tax rates applying after the current year

An entity reporting half-yearly operates in a jurisdiction subject to a tax rate of 30%. Legislation is enacted during the first half of the current year, which reduces the tax rate to 28% on income earned from the beginning of the entity's next financial year. Based on a gross temporary difference of 1,000, the entity reported a deferred tax liability in its most recent annual financial statements of 300 (1,000 @ 30%). Of this temporary difference, 200 is expected to reverse in the second half of the current year and 800 in the next financial year. Assuming that no new temporary differences arise in the current period, what is the deferred tax balance at the interim reporting date?

Whilst the entity uses an effective tax rate of 30% to determine the tax expense relating to income earned in the period, it should use a rate of 28% to measure those temporary differences expected to reverse in the next financial year. Accordingly, the deferred tax liability at the half-year reporting date is 284 (200 @ 30% + 800 @ 28%).

Alternatively, if the effective current tax rate is not distinguished from the measurement of deferred tax, it could be argued that IAS 34 allows the reduction in the deferred tax liability of 16 (300 – 284) to be included in the estimate of the effective income tax rate for the year. Approach 2 in Example 41.17 below applies this argument. In our view, because IAS 34 does not distinguish between current and deferred taxes, either approach would be acceptable provided that is applied consistently.

9.5.3 Difference in financial year and tax year

If an entity's financial year and the income tax year differ, the income tax expense for the interim periods of that financial year should be measured using separate weighted-average estimated effective tax rates for each of the income tax years applied to the portion of pre-tax income earned in each of those income tax years. *[IAS 34.B17]*. In other words, an entity should compute a weighted-average estimated effective tax rate for each income tax year, rather than for its financial year.

Example 41.16: Difference in financial year and tax year *[IAS 34.B18]*

An entity's financial year ends 30 June and it reports quarterly. Its taxable year ends 31 December. For the financial year that begins 1 July 2020 and ends 30 June 2021, the entity earns 10,000 pre-tax each quarter.

The estimated average annual income tax rate is 30% in the income tax year to 31 December 2020 and 40% in the year to 31 December 2021.

Quarter ending	Pre-tax earnings	Effective tax rate	Tax expense
30 September 2020	10,000	30%	3,000
31 December 2020	10,000	30%	3,000
31 March 2021	10,000	40%	4,000
30 June 2021	10,000	40%	4,000
Annual	40,000		14,000

9.5.4 Tax loss and tax credit carrybacks and carryforwards

Appendix B to IAS 34 repeats the requirement in IAS 12 that for carryforwards of unused tax losses and tax credits, a deferred tax asset should be recognised to the extent that it is probable that future taxable profit will be available against which the unused tax losses and unused tax credits can be utilised. In assessing whether future taxable profit is available, the criteria in IAS 12 are applied at the interim date. If these criteria are met as at the end of the interim period, the effect of the tax loss carryforwards is included in the estimated average annual effective income tax rate. *[IAS 34.B21]*.

Example 41.17: Tax loss carryforwards expected to be recovered in the current year *[IAS 34.B22]*

An entity that reports quarterly has unutilised operating losses of 10,000 for income tax purposes at the start of the current financial year for which a deferred tax asset has not been recognised. The entity earns 10,000 in the first quarter of the current year and expects to earn 10,000 in each of the three remaining quarters. Excluding the effect of utilising losses carried forward, the estimated average annual income tax rate is 40%. Including the carryforward, the estimated average annual income tax rate is 30%. Accordingly, tax expense is determined by applying the 30% rate to earnings each quarter as follows:

	Pre-tax earnings	Effective tax rate	Tax expense
First quarter	10,000	30%	3,000
Second quarter	10,000	30%	3,000
Third quarter	10,000	30%	3,000
Fourth quarter	10,000	30%	3,000
Annual	40,000		12,000

This result is consistent with the general approach for measuring income tax expense in the interim report, in that any entitlement for relief from current tax due to carried forward losses is determined on an annual basis. Accordingly, its effect is included in the estimate of the average annual income tax rate and not, for example, by allocating all of the unutilised losses against the earnings of the first quarter to give an income tax expense of zero in the first quarter and 4,000 thereafter.

In contrast, the year-to-date approach of IAS 34 means that the benefits of a tax loss carryback are recognised in the interim period in which the related tax loss occurs, *[IAS 34.B20]*, and are not included in the assessment of the estimated average annual tax rate, as shown in Example 41.12 above. This approach is consistent with IAS 12, which requires the benefit of a tax loss that can be carried back to recover current tax already incurred in a previous period to be recognised as an asset. *[IAS 12.13]*. Therefore, a corresponding reduction of tax expense or increase of tax income is also recognised. *[IAS 34.B20]*.

Where previously unrecognised tax losses are expected to be utilised in full in the current year, it seems intuitive to recognise the recovery of those carried forward losses in the estimate of the average annual tax rate, as shown in Example 41.16 above. Where the level of previously unrecognised tax losses exceeds expected taxable profits for the current year, a deferred tax asset should be recognised for the carried forward losses that are now expected to be utilised, albeit in future years.

The examples in IAS 34 do not show how such a deferred tax asset is created in the interim financial report. In our view, two approaches are acceptable, as shown in Example 41.18 below.

Example 41.18: Tax loss carryforwards in excess of current year expected profits

An entity that reports half-yearly has unutilised operating losses of 75,000 for income tax purposes at the start of the current financial year for which no deferred tax asset has been recognised. At the end of its first interim period, the entity reports a profit before tax of 25,000 and expects to earn a profit of 20,000 before tax in the second half of the year. The entity reassesses the likelihood of generating sufficient profits to utilise its carried forward tax losses and determines that the IAS 12 recognition criteria for a deferred tax asset are satisfied for the full amount of 75,000. Excluding the effect of utilising losses carried forward, the estimated average annual income tax rate is the same as the enacted or substantially enacted rate of 40%.

As at the end of the current financial year the entity expects to have unutilised losses of 30,000 (75,000 carried forward less current year pre-tax profits of 45,000). Using the enacted rate of 40%, a deferred tax asset of 12,000 is recognised at year-end. How is this deferred tax asset recognised in the interim reporting periods?

Approach 1

Under the first approach, the estimate of the average annual effective tax rate includes only those carried forward losses expected to be utilised in the current financial year and a separate deferred tax asset is recognised for those carried forward losses now expected to be utilised in future annual reporting periods.

In the fact pattern above, using 45,000 of the carried forward tax losses gives an average effective annual tax rate of nil, as follows:

Estimation of the annual effective tax rate – Approach 1	
Expected annual tax expense before utilising losses carried forward (45,000 @ 40%)	18,000
Tax benefit of utilising carried forward tax losses (45,000 @ 40%)	(18,000)
Expected annual tax expense before the effect of losses carried forward to future annual periods	0
Expected annual effective tax rate	0%
Effect of tax losses carried forward to future periods (75,000 – 45,000 @ 40%)	(12,000)
Tax income to be recognised in the interim period	(12,000)

The remaining tax losses give rise to a deferred tax asset of 12,000, which is recognised in full at the half-year, to give reported profits after tax as follows:

	First half-year	*Second half-year*	*Annual*
Profit before income tax	25,000	20,000	45,000
Income tax (expense)/credit			
– at expected annual effective rate	0	0	0
– recognition of deferred tax asset	12,000	0	12,000
Net profit after tax	37,000	20,000	57,000

Approach 2

Under the second approach, the estimate of the average annual effective tax rate reflects the expected recovery of all the previously unutilised tax losses from the beginning of the period in which the assessment of recoverability changed. In the fact pattern above, recognition of the unutilised tax losses gives an average effective annual tax rate of –26.67%, as follows:

Estimation of the annual effective tax rate – Approach 2	
Expected annual tax expense before utilising losses carried forward (45,000 @ 40%)	18,000
Tax benefit of recognising unutilised tax losses (75,000 @ 40%)	(30,000)
Expected annual tax credit after recognising unutilised tax losses	(12,000)
Expected annual effective tax rate (–12,000 ÷ 45,000)	–26.67%

This approach results in reported profits after tax as follows:

	First half-year	*Second half-year*	*Annual*
Profit before income tax	25,000	20,000	45,000
Income tax (expense)/credit			
– at expected annual effective rate	6,667	5,333	12,000
Net profit after tax	31,667	25,333	57,000

Approach 1 is consistent with the requirements of IAS 12 as it results in recognising the full expected deferred tax asset as soon as it becomes 'probable that taxable profit will be available against which the deductible temporary difference can be utilised'. *[IAS 12.24]*. However, given that IAS 34 does not specifically address this situation, and is unclear about whether the effective tax rate reflects changes in the assessment of the recoverability of carried forward tax losses, we also believe that Approach 2 is acceptable.

9.5.5 Tax credits

IAS 34 also discusses in more detail the treatment of tax credits, which may for example be based on amounts of capital expenditures, exports, or research and development expenditures. Such benefits are often granted and calculated on an annual basis under tax laws and regulations and therefore are generally reflected in the estimated annual effective income tax rate used in the interim report. However, if tax benefits relate to a one-time event, they should be excluded from the estimate of the annual rate and deducted separately from income tax expense in that interim period, in the same way that special tax rates applicable to particular categories of income are not blended into a single effective annual tax rate. Occasionally, some tax credits are more akin to a government grant, which are recognised in the interim period in which they arise. *[IAS 34.B19]*. Similar considerations arise in determining the extent to which the existence of non-taxable income or non-deductible expenditure should be incorporated into the estimate of the weighted-average annual income tax rate expected for the full financial year. This requires the exercise of judgement.

In the Extract 41.30 below, Anheuser-Busch InBev NV/SA explains the reasons for an increase in the effective tax rate in the interim period and the effect of expenditure that is not deductible for tax purposes.

Extract 41.30: Anheuser-Busch InBev NV/SA (30 June 2019)

Notes to the unaudited condensed consolidated interim financial statements [extract]

9. Income taxes [extract]

The total income tax expense for the six-month period ended 30 June 2019 amounts to 1 666m US dollar compared to 1 420m US dollar in 2018. The effective tax rate decreased from 28.9% for the six-month period ended 30 June 2018 to 20.2% for the six-month period ended 30 June 2019. The 2019 effective tax rate was positively impacted by non-taxable gains from derivatives related to the hedging of share-based payment programs and the hedging of the shares issued in a transaction related to the combination with Grupo Modelo and SAB. The 2018 effective tax rate was negatively impacted by non-deductible losses from these derivatives.

9.6 Foreign currency translation

9.6.1 Foreign currency translation gains and losses

An entity measures foreign currency translation gains and losses for interim financial reporting using the same principles that IAS 21 – *The Effects of Changes in Foreign Exchange Rates* – requires at year-end (see Chapter 15). *[IAS 34.B29]*. An entity should use the actual average and closing foreign exchange rates for the interim period (i.e. it may not anticipate changes in foreign exchange rates for the remainder of the current year in translating at an interim date). *[IAS 34.B30]*. Where IAS 21 requires translation adjustments to be recognised as income or expense in the period in which they arise, the same approach should be used in the interim report. An entity should not defer some foreign currency translation adjustments at an interim date, even if it expects the adjustment to reverse before year-end. *[IAS 34.B31]*.

9.6.2 Interim financial reporting in hyperinflationary economies

Interim financial reports in hyperinflationary economies are prepared using the same principles as at year-end. *[IAS 34.B32]*. IAS 29 – *Financial Reporting in Hyperinflationary Economies* – requires that the financial statements of an entity that reports in the currency of a hyperinflationary economy be stated in terms of the measuring unit current at the end of the reporting period, and the gain or loss on the net monetary position be included in net income. In addition, comparative financial data reported for prior periods should be restated to the current measuring unit (see Chapter 16). *[IAS 34.B33]*. As shown in Examples 41.4 and 41.5 above, IAS 34 requires an interim report to contain many components, which are all restated at every interim reporting date.

The measuring unit used is the same as that as of the end of the interim period, with the resulting gain or loss on the net monetary position included in that period's net income. An entity may not annualise the recognition of gains or losses, nor may it estimate an annual inflation rate in preparing an interim financial report in a hyperinflationary economy. *[IAS 34.B34]*. See Chapter 16 at 10.1.

IAS 29 applies from the beginning of the reporting period in which an entity identifies the existence of hyperinflation in the country in whose currency it reports. *[IAS 29.4]*. Accordingly, for interim reporting purposes, IAS 29 should be applied from the beginning of the interim period in which the hyperinflation is identified. The Interpretations Committee has clarified that adoption of IAS 29 should be fully retrospective, by applying its requirements as if the economy had always been hyperinflationary (see Chapter 16 at 9). *[IFRIC 7.3]*.

It is less obvious how a parent, which does not operate in a hyperinflationary economy, should account for the restatement of a subsidiary that operates in an economy that becomes hyperinflationary in the current reporting period when incorporating it within its consolidated financial statements.

This issue has been clarified by paragraph 42(b) of IAS 21 which specifically prohibits restatement of comparative figures when the reporting currency is not hyperinflationary. This means that when the financial statements of a hyperinflationary subsidiary are translated into the non-hyperinflationary reporting currency of the parent, the comparative amounts are not adjusted.

Notwithstanding the above, some argue that in interim period reports of the subsequent year, the parent should adjust its comparative information for the corresponding interim periods which are part of the (first) full financial year affected by hyperinflation. This is because comparative interim information had been part of the full year financial statements, which were adjusted for hyperinflation.

In our view, the parent is allowed, but not required, to adjust the comparative interim information that relates to the first full financial year affected by hyperinflation, as illustrated in the example below:

Example 41.19: Accounting by the parent when a hyperinflationary subsidiary first applies IAS 29

A parent with 31 December year-end owns a subsidiary, whose functional currency is considered hyperinflationary from 31 July 2020 onwards. In preparing its interim consolidated financial statements for the quarter ended 31 March 2021, the parent consolidates this subsidiary in both the current and comparative interim periods.

In our view the parent is allowed, but not required, to adjust the comparative interim information (for the quarter ended 31 March 2020) in its 31 March 2021 interim financial report.

Whilst IAS 34 and IAS 29 are silent on the matter, a consequence of this approach suggests that when an economy stops being hyperinflationary, the entity should stop applying the requirements of IAS 29 during that interim period. However, in practice, it is difficult to determine when an economy stops being hyperinflationary. The characteristics indicating restored confidence in an economy (such as the population ceasing to store wealth in a more stable foreign currency) change gradually as sufficient time elapses to indicate that the three-year cumulative inflation rate is likely to stay below 100%. When the exit from hyperinflation can reasonably be identified, an entity should stop applying IAS 29 in that interim period. Prior interim periods should not be restated; instead, the entity should treat the amounts expressed in the measuring unit current as at the end of the previous reporting period as the basis for the carrying amounts in its subsequent interim reports, *[IAS 29.38]*, (see Chapter 16 at 10.2).

9.7 Provisions, contingencies and accruals for other costs

9.7.1 Provisions

IAS 34 requires an entity to apply the same criteria for recognising and measuring a provision at an interim date as it would at year-end. *[IAS 34.B4]*. Hence, an entity should recognise a provision when it has no realistic alternative but to transfer economic benefits because of an event that has created a legal or constructive obligation. *[IAS 34.B3]*. The standard emphasises that the existence or non-existence of an obligation to transfer benefits is a question of fact and does not depend on the length of the reporting period. *[IAS 34.B4]*. Also, as noted at 8.1.1 above, measurement on a year-to-date basis requires that a liability at the end of an interim reporting period must represent an existing obligation at that date, just as it must at the end of an annual reporting period. *[IAS 34.32]*. Entities should not anticipate obligations that are expected to arise later in the annual reporting period.

The obligation is adjusted upward or downward at each interim reporting date, if the entity's best estimate of the amount of the obligation changes. The standard states that any corresponding loss or gain should normally be recognised in profit or loss. *[IAS 34.B3]*. However, an entity applying IFRIC 1 – *Changes in Existing Decommissioning, Restoration and Similar Liabilities* – might instead need to adjust the carrying amount of the corresponding asset rather than recognise a gain or loss. *[IFRIC 1.4-6]*.

9.7.2 Other planned but irregularly occurring costs

Many entities budget for costs that they expect to incur irregularly during the year, such as advertising campaigns, employee training and charitable contributions. Even though these costs are planned and expected to recur annually, they tend to be discretionary in nature. Therefore, it is generally not appropriate to recognise an obligation at the end of an interim financial reporting period for such costs that are not yet incurred, as they do not meet the definition of a liability. *[IAS 34.B11]*.

As discussed at 8.2.2 above, IAS 34 prohibits the recognition or deferral of costs incurred unevenly throughout the year at the interim date if recognition or deferral would be inappropriate at year-end. *[IAS 34.39]*. Accordingly, such costs should be recognised as they are incurred and an entity should not recognise provisions or accruals in the interim report to adjust these costs to their budgeted amount.

In Extract 41.31 below, Coca-Cola HBC AG, in its June 2018 interim report, explains the reasons certain fixed costs are not significantly affected by business seasonality.

Extract 41.31: Coca-Cola HBC AG (Interim ended June 2018)

Selected explanatory notes to the condensed consolidated interim financial statements (unaudited) [extract]

1. Basis of preparation and accounting policies [extract]
Basis of preparation [extract]

Operating results for the first half of 2018 are not indicative of the results that may be expected for the year ending 31 December 2018 because of business seasonality. Business seasonality results from higher unit sales of the Group's products in the warmer months of the year. The Group's methods of accounting for fixed costs such as depreciation and interest expense are not significantly affected by business seasonality.

9.7.3 Major planned periodic maintenance or overhaul

The cost of periodic maintenance, a planned major overhaul, or other seasonal expenditures expected to occur after the interim reporting date should not be recognised for interim reporting purposes unless an event before the end of the interim period causes the entity to have a legal or constructive obligation. The mere intention or necessity to incur expenditures in the future is not sufficient to recognise an obligation as at the interim reporting date. *[IAS 34.B2]*. Similarly, an entity may not defer and amortise such costs if they are incurred early in the year, but do not satisfy the criteria for recognition as an asset as at the interim reporting date.

9.7.4 Variable lease payments

Variable lease payments can create legal or constructive obligations that are recognised as liabilities even though such amounts are not included in the lease liability in the period. If a lease includes variable payments based on achieving a certain level of annual sales (or annual use of the asset), an obligation can arise in an interim period before the required level of annual sales (or usage) is achieved. If the entity expects to achieve the required level of annual sales (or usage), it should recognise a liability as it has no realistic alternative but to make the future lease payment. *[IAS 34.B7]*.

9.7.5 *Levies charged by public authorities*

When governments or other public authorities impose levies on entities in relation to their activities, as opposed to income taxes, it is not always clear when the liability to pay a levy arises and a provision should be recognised. IFRIC 21 – *Levies* – addresses this issue. The scope of the Interpretation is limited to provisions within the scope of IAS 37 and specifically need not be applied to emissions trading schemes. *[IFRIC 21.2, 6]*.

The Interpretation requires that for an activity within its scope, an entity should recognise a liability for a levy only when the activity that triggers payment, as identified by the relevant legislation, occurs. *[IFRIC 21.8]*. The Interpretation states that neither a constructive nor a present obligation arises as a result of being economically compelled to continue operating; or from any implication of continuing operations in the future arising from the use of the going concern assumption in the preparation of financial statements (see Chapter 26 at 6.8). *[IFRIC 21.9-10]*.

The Interpretation states that the same recognition principles should be applied in the interim financial statements. Therefore, a liability for any levy expense should not be anticipated if there is no present obligation to pay the levy at the end of the interim reporting period. Similarly, a liability should not be deferred if a present obligation to pay the levy exists at the end of the interim period. *[IFRIC 21.31]*.

This is relatively simple when a levy is triggered on a specific day or when a specific event occurs. When a levy is triggered progressively, for example as the entity generates revenues, the levy is accrued over time. At any time in the year, the entity would have a present obligation to pay an amount of levy that would be based on revenues generated to that date and recognises a liability and an expense on that basis. *[IFRIC 21.11]*.

The following examples illustrate the above principles in a number of scenarios and demonstrate how the appropriate accounting treatment has to reflect the specific facts and circumstances that apply in determining an entity's obligation to pay the levy in line with the relevant legislation.

When the legislation provides that a levy is triggered by an entity operating in a market only at the end of the annual reporting period, no liability is recognised until the last day of the annual reporting period. No amount is recognised before that date in anticipation of the entity still operating in the market. This means that in the interim financial reports for that year, no liability for the levy expense is recognised. Only if the entity reports for the last quarter of that year would the expenditure appear in an interim report. *[IFRIC 21.IE1 Example 2]*.

If a levy is triggered in full as soon as the entity commences generating revenues, the liability is recognised in full on the first day that the entity commences generating revenue. In this case, the entity does not defer any expense and amortise this amount over the year or otherwise allocate it to subsequent interim periods. The example below illustrates this situation. *[IFRIC 21.IE1 Example 2]*.

Example 41.20: A levy is triggered in full as soon as the entity generates revenue

An entity has a calendar year end. In accordance with legislation, a levy is triggered in full as soon as the entity generates revenue in 2021. The amount of the levy is determined by reference to revenue generated by the entity in 2020. The entity generated revenue in 2020 and starts to generate revenue in 2021 on 3 January 2021.

In this example, the liability is recognised in full on 3 January 2021 because the obligating event, as identified by the legislation, is the first generation of revenue in 2021. The generation of revenue in 2020 is necessary, but not sufficient, to create a present obligation to pay a levy. Before 3 January 2021, the entity has no obligation. In other words, the activity that triggers the payment of the levy as identified by the legislation is the first generation of revenue at a point in time in 2021.

The generation of revenues in 2020 is not the activity that triggers the payment of the levy. The amount of revenue generated in 2020 only affects the measurement of the liability.

In the interim financial report, because the liability is recognised in full on 3 January 2021, the expense is recognised in full in the first interim period of 2021. The expense should not be deferred until subsequent interim periods and shall not be anticipated in previous interim periods.

Another situation is when a levy is triggered in full as soon as the entity generates revenue from an activity above a certain annual threshold is illustrated in the following example. *[IFRIC 21.IE1 Example 4]*.

Example 41.21: A levy is triggered in full as soon as the entity generates revenue from a certain activity above an annual threshold, which is reduced pro rata *when the entity ceases participation in that activity during the year*

A bank has a calendar year end. In accordance with legislation, a bank levy is triggered only if the bank generated revenue above the annual threshold of CU10 million in 2021. The amount of the levy payable is calculated based on 0.1% of the annual threshold of CU10 million and is assessed as at 31 December every year. i.e. Annual revenue below CU10 million attracts no levy and revenue of at least CU10 million attracts a levy of CU10,000 (0.1% × CU10 million). However, if the bank ceases operations during the year, the annual threshold of CU10 million will then be reduced *pro rata*, based on the number of days the bank was in operation during the year and the levy payable will then be based on 0.1% of the pro-rated annual threshold.

The owners of the bank ceased operation with effect from 1 July 2021. As at 31 March 2021 and 30 June 2021, the revenue generated amounted to CU4 million and CU8 million, respectively.

In this example, the liability is recognised in the interim financial report as follows:

31 March 2021:	Nil
30 June 2021:	Nil
30 September 2021:	CU5,000 (CU10 million × (6/12 months) × 0.1%)
31 December 2021:	CU5,000 (CU10 million × (6/12 months) × 0.1%)

Based on discussions by the IFRS Interpretations Committee during their March 2015 meeting, the threshold for determining the entity's liability would only be reduced (or pro-rated) if, and only if, the entity stops the relevant activity before the end of the annual assessment period.[7] This means that the pro-rated annual threshold would only apply from the date the entity stops the relevant activity in the market.

At 31 March 2021 and 30 June 2021, the bank has not ceased operations and the annual threshold remains at CU10 million. Since the revenue generated as at 31 March 2021 and 30 June 2021 did not meet the annual threshold, no liability is recognised under IFRIC 21 on both dates.

In contrast, the bank ceased operation from 1 July 2021. Hence, the annual threshold would have been pro-rated and reduced to CU5 million at that date.

For the quarters as at 30 September and 31 December 2021 a liability of CU5,000 should thus be recognised accordingly.

In many countries, property taxes are levied by municipalities or other local government bodies on the owner of a property. Such taxes are relevant and may be material to entities in certain sectors (e.g. real estate). Even within a single jurisdiction, there could be several different property tax mechanisms. Generally, each property tax arrangement must be assessed on its own merits. To facilitate such assessments, we have explored some illustrative fact patterns of property tax mechanisms in the following examples:

Example 41.22: A levy is triggered in full as soon as the entity holds the property at a specified date

In accordance with the legislation, property tax is imposed on the registered owner of the property as at 1 April each year. The amount payable is calculated based on 0.1% of the appraised value estimated by the tax authorities as at 1 April each year. Payments are to be made in arrears in instalments on June, September, December and March month-end dates and any unpaid instalments remain as the liability of the registered owner of the property as at 1 April.

The law also states that if the property is sold during the year, there will be no refund from the government to the seller. The new property owner will only be liable to pay the property tax on 1 April of the coming year, subsequent to the date of purchase.

An entity has a calendar year-end and prepares quarterly interim financial reports. It holds a property as at 1 April 2021, which has an appraised value of CU50 million. On 30 June 2021, it sold the property to another entity.

In this example, the liability is recognised in the interim financial report as follows:

31 March 2021:	Nil, since the obligating event is not until 1 April, assuming that all previous year instalments have been paid on time
1 April 2021:	CU50,000 (CU50 million × 0.1%), i.e. the liability is recognised in full

For the subsequent interim period's reports as at 30 June, 30 September and 31 December, the liability recognised in the statement of financial position would be CU50,000 less the instalment payments made during the year.

If in a variation to the above fact pattern, the seller is able to obtain a refund of a proportionate share of the paid property tax (i.e. CU37,500) from the buyer of the property and this refund will form part of the sales price of the property based on the sales contract between the buyer and the seller, it would not change the accounting for the levy under IFRIC 21.

Yet another situation arises where a levy is triggered progressively.

Example 41.23: A levy is triggered progressively as the entity holds the asset through a specified period of time

In accordance with the legislation, property tax is imposed on the registered owner of the property as at 1 April each year. The amount payable is calculated based on 0.1% of the appraised value estimated by the tax authorities as at 1 April each year. Payments are to be made in instalments at every March, June, September and December month-end.

The law does not explicitly state that the property tax relates to a period of time. However, if the property is sold during the year, the amount of property tax will be pro-rated for the period from 1 April to the date of sale, and any excess will be refunded to the entity by the government. The new property owner will only be liable to pay the property tax upon the date of purchase, for the period from the date of purchase.

An entity has a calendar year-end and prepares quarterly interim financial reports. It holds a property as at 1 April 2021 to 31 March 2022, which has an appraised value of CU50 million as at 1 April 2021. Prior to 1 April 2021 the entity did not hold any property. For simplicity, assume that the appraised value does not change year on year.

In this example, although the law does not explicitly state that the property tax relates to the entity holding the property over a period of time, it is evident that the obligating event occurs rateably over the 12-month period from 1 April to 31 March. This is because the law allows for a pro-rated refund to be given to the entity for the period whereby the entity no longer holds the property. This implies that it is a time-based progressive levy.

As such, the levy is triggered over a 12-month period and the liability is recognised rateably over the 12-month period. In contrast with Example 41.21, it is not the ownership of the property at a specified date that is the obligating even. Rather, it is the continued holding of the property throughout the period that gives rise to the obligating event.

As such, the liability is recognised in the interim report as follows:

31 March 2021:	Nil
30 June 2021:	CU12,500 (CU50,000 divided by 4), less any instalment payments made
30 September 2021:	CU25,000 (cumulative portion of the prior quarter and current quarter), less any instalment payments made
31 December 2021:	CU37,500 (cumulative portion of the prior two quarters and current quarter), less any instalment payments made
31 March 2022:	CU50,000 (cumulative portion of the prior three quarter and current quarter), less any instalment payments made

The impact on interim reports for the various types of levies is summarised below:

Illustrative examples	**Obligating event**	**Recognition of liability in interim reports**
Levy triggered progressively as revenue is generated in specified period	Generation of revenue in the specified period	Recognise progressively based on revenue generated
Levy triggered in full as soon as revenue is generated in one period, based on revenues from a previous period	First generation of revenue in subsequent period	Recognise only if first revenue generated in interim period
Levy triggered in full if entity operates as a bank at the end of the annual reporting period	Operating as a bank at the end of the reporting period	Recognise only if interim period includes the last day of the annual reporting period specified in the legislation. Otherwise, a provision would not be permitted to be recognised in interim reports
Levy triggered if revenues are above a minimum specified threshold (e.g. when a certain level of revenue has been achieved)	Reaching the specified minimum threshold	Recognise only where the minimum threshold has been met or exceeded during the interim period. Otherwise, a provision would not be permitted to be recognised in interim reports

These requirements illustrate what is meant by the concept of the 'year-to-date' basis in IAS 34 and discussed at 8 above.

9.8 Earnings per share

Earnings per share (EPS) in an interim period is computed in the same way as for annual periods. However, IAS 33 – *Earnings per Share* – does not allow diluted EPS of a prior period to be restated for subsequent changes in the assumptions used in those EPS calculations. *[IAS 33.65]*. This approach might be perceived as inconsistent to the year-to-date approach which should be followed for computing EPS for an interim period. For example, if an entity, reporting quarterly, computes diluted EPS in its first quarter financial statements, it cannot restate the reported diluted EPS subsequently for any changes in the assumptions used. However, following a year-to-date approach, the entity should consider the revised assumptions to compute the diluted EPS for the six months in its second quarter financial statements, which, in this case would not be the sum of its diluted EPS for first quarter and the second quarter.

10 USE OF ESTIMATES

IAS 34 requires that the measurement procedures followed in an interim financial report should be designed to ensure that the resulting information is reliable and that all material financial information that is relevant to an understanding of the financial position or performance of the entity is appropriately disclosed. Whilst estimation is necessary in both interim and annual financial statements, the standard recognises that preparing interim financial reports generally requires greater use of estimates than at year-end. *[IAS 34.41]*. Because the standard accepts a higher degree of estimation by the entity, the measurement of assets and liabilities at an interim date may involve less use of outside experts in determining amounts for items such as provisions, contingencies, pensions or non-current assets revalued at fair values. Reliable measurement of such amounts may simply involve updating the previously reported year-end position. The procedures may be less rigorous than those at year-end. The example below is based on Appendix C to IAS 34. *[IAS 34.42]*.

Example 41.24: Use of estimates

Inventories	Full stock-taking and valuation procedures may not be required for inventories at interim dates, although it may be done at year-end. It may be sufficient to make estimates at interim dates based on sales margins.
Classifications of current and non-current assets and liabilities	Entities may do a more thorough investigation for classifying assets and liabilities as current or non-current at annual reporting dates than at interim dates.
Provisions	Determining the appropriate provision (such as a provision for warranties, environmental costs, and site restoration costs) may be complex and often costly and time-consuming. Entities sometimes engage outside experts to assist in the annual calculations. Making similar estimates at interim dates often entails updating of the prior annual provision rather than the engaging of outside experts to do a new calculation.
Pensions	IAS 19 requires an entity to determine the present value of defined benefit obligations and the fair value of plan assets at the end of each reporting period and encourages an entity to involve a professionally qualified actuary in measurement of the obligations. As discussed at 9.3.3 above, market values of plan assets as at the interim reporting date should be available without recourse to an actuary, and reliable measurement of defined benefit obligations for interim reporting purposes can often be extrapolated from the latest actuarial valuation.

Income taxes	Entities may calculate income tax expense and deferred income tax liability at annual dates by applying the tax rate for each individual jurisdiction to measures of income for each jurisdiction. Paragraph 14 of Appendix B (see 9.5.1 above) acknowledges that while that degree of precision is desirable at interim reporting dates as well, it may not be achievable in all cases, and a weighted-average of rates across jurisdictions or across categories of income is used if it is a reasonable approximation of the effect of using more specific rates.
Contingencies	The measurement of contingencies may involve the opinions of legal experts or other advisers. Formal reports from independent experts are sometimes obtained for contingencies. Such opinions about litigation, claims, assessments, and other contingencies and uncertainties may or may not also be needed at interim dates.
Revaluations and fair value accounting	IAS 16 allows an entity to choose as its accounting policy the revaluation model whereby items of property, plant and equipment are revalued to fair value. Similarly, IAS 40 – *Investment Property* – requires an entity to measure the fair value of investment property. An entity should revalue at the end of the interim reporting period, but may choose not to rely on professionally qualified valuers to the extent that is required at year-end.
Intercompany reconciliations	Some intercompany balances that are reconciled on a detailed level in preparing consolidated financial statements at year-end might be reconciled at a less detailed level in preparing consolidated financial statements at an interim date.
Specialised industries	Because of complexity, costliness, and time, interim period measurements in specialised industries might be less precise than at year-end. An example is calculation of insurance reserves by insurance companies.

Attention is given to items that are recognised at fair value. Although an entity is not required to use professionally qualified valuers at interim reporting dates, and may only update the previous year-end position, the entity is required to recognise impairments in the proper interim period.

11 EFFECTIVE DATES AND TRANSITIONAL RULES

11.1 First-time presentation of interim reports complying with IAS 34

IAS 34 does not contain any general transitional rules. Therefore, an existing IFRS reporting entity must apply the requirements of IAS 34 in full and without any transitional relief when it first chooses (or is required) to publish an interim financial report prepared under IFRS.

For example, an entity that has already published annual financial statements prepared under IFRS and either chooses (or is required) to prepare interim financial reports in compliance with IAS 34 must present all the information required by the standard for the current interim period, cumulatively for the current year-to-date, and for comparable periods (current and year-to-date) of the preceding year. *[IAS 34.20]*. The absence of any transitional provisions requires such entities to restate previously reported interim financial information to comply with IAS 34 and to present information relating to comparative interim periods, such as in respect of segment disclosures or in relation to asset write-downs and reversals thereof, which might not previously have been reported.

11.1.1 Condensed financial statements in the year of incorporation or when an entity converts from its local GAAP to IFRS

The standard defines 'interim period' as a financial reporting period shorter than a full financial year, *[IAS 34.4]*, and requires the format of condensed financial statements for an interim period to include each of the headings and subtotals that were included in the entity's most recent annual financial statements. *[IAS 34.10]*.

However, IAS 34 provides no guidance for an entity that either is required or chooses to issue interim financial statements before it has prepared a set of IFRS compliant annual financial statements. This situation might arise in the entity's first year of its existence or in the year in which the entity converts from its local GAAP to IFRS. Whilst the standard does not prohibit the entity from preparing a condensed set of interim financial statements, it does not specify how an entity would interpret the minimum disclosure requirements of IAS 34 when there are no annual financial statements to refer to.

The entity should consider making additional disclosures to recognise that a user of this first set of interim financial statements does not have the access otherwise assumed by the standard to the most recent annual financial report of the entity. Accordingly, the explanation of significant events and transactions and changes in financial position in the period should be more detailed than the update normally expected in IAS 34. *[IAS 34.15]*. In the absence of any specific regulatory requirements to which the entity is subject, the following are examples of additional considerations that would apply:

- since it is not possible to make a statement that the same accounting policies and methods of computation have been applied, *[IAS 34.16A(a)]*, the entity should disclose all those accounting policies and methods of computation in the same level of detail as it would in a set of annual financial statements. When the entity issues interim reports on a quarterly basis, the first quarter interim report should provide the abovementioned details; subsequent quarterly reports could refer to the details included in the first quarter report;
- similarly, the disclosure of the nature and amount of changes in estimates of amounts reported in prior periods will have to go into more detail than just the changes normally required to be disclosed; *[IAS 34.16A(d)]*
- mere disclosure of transfers between levels of the fair value hierarchy used in measuring the fair value of financial instruments, *[IAS 34.15B(k)]*, would not be meaningful unless put in the context of how those fair values are determined (e.g. methods used, any assumptions applied) and providing a detailed classification of all such financial instrument measurements using fair value hierarchy, based on the significance of the inputs used;
- rather than disclosing changes in the basis of segmentation or in the basis of measurement of segment profit and loss, *[IAS 34.16A(g)(v)]*, a full description will be

necessary, as will the disclosure of segment assets and liabilities, *[IAS 34.16A(g)(iv)]*, where such information is required to be disclosed in the annual financial statements; *[IAS 34.16A(g)]*

- more extensive disclosure than simply the changes since the last report date will be required for contingent liabilities and contingent assets; *[IAS 34.15B(m)]* and
- in the absence of a complete set of annual financial statements complying with IFRS, the entity should include each of the headings and subtotals in the condensed financial statements that it would expect to include in its first financial statements prepared under IFRS.

Entities that have converted from local GAAP to IFRS and have not yet presented IFRS annual financial statements are subject to additional requirements under IFRS 1 – *First-time Adoption of International Financial Reporting Standards* – when presenting interim reports in accordance with IAS 34. Such requirements are discussed in detail in Chapter 5 at 6.6.

Example 42.4: Physical change and price change..3317

Chapter 42 Agriculture

1 INTRODUCTION

IAS 41 – *Agriculture* – prescribes the accounting treatment for most agricultural activity, from the initial recognition of a biological asset to the harvest of agricultural produce.

IAS 41 applies to some, but not all biological assets. In particular, IAS 41 excludes bearer plants, as defined, from its scope. Instead, they are within the scope of IAS 16 – *Property, Plant and Equipment* – and are subject to all of the requirements therein. However, agricultural produce growing on bearer plants (e.g. fruit growing on a tree) are within the scope of IAS 41 and are treated as biological assets.

Practical difficulties may arise when determining which assets are within the scope of the standard, particularly for arrangements that involve leases or concessions. Entities may also find it particularly challenging to apply two different measurement models under two different standards to bearer plants, as defined, and the produce growing thereon. However, it is IAS 41's application of the fair value model that can be the most challenging and contentious.

For assets that are in-scope, IAS 41 requires the application of the fair value model to animals and plant life alike, with limited relief. Under this approach, a market price for an animal or part-grown crop is presumed to exist (or is presumed to be reliably measurable if there is no such market price) and the animal or part-grown crop must be valued at this price in the entity's financial statements. The fair value model is applied to all biological assets that are in-scope, regardless of whether they are consumed as part of the agricultural activity (consumable biological assets) or not (bearer biological assets).

This chapter discusses the requirements of IAS 41, along with the requirements for bearer plants under IAS 16.

2 OBJECTIVE, DEFINITIONS AND SCOPE

2.1 Objective

The stated objective of IAS 41 is to 'prescribe the accounting treatment and disclosures related to agricultural activity'. *[IAS 41 Objective].*

2.2 Definitions

2.2.1 Agriculture-related definitions

IAS 41 defines *agricultural activity* as 'the management by an entity of the biological transformation and harvest of biological assets for sale or for conversion into agricultural produce or into additional biological assets'. *[IAS 41.5]*.

The standard states that 'agricultural activity' covers a wide range of activities, e.g. 'raising livestock, forestry, annual or perennial cropping, cultivating orchards and plantations, floriculture, and aquaculture (including fish farming)'. *[IAS 41.6]*. Nevertheless, these agricultural activities have certain common features:

'(a) *Capability to change*. Living animals and plants are capable of biological transformation;

(b) *Management of change*. Management facilitates biological transformation by enhancing, or at least stabilising, conditions necessary for the process to take place (for example, nutrient levels, moisture, temperature, fertility, and light). Such management distinguishes agricultural activity from other activities. For example, harvesting from unmanaged sources (such as ocean fishing and deforestation) is not agricultural activity; and

(c) *Measurement of change*. The change in quality (for example, genetic merit, density, ripeness, fat cover, protein content, and fibre strength) or quantity (for example, progeny, weight, cubic metres, fibre length or diameter, and number of buds) brought about by biological transformation or harvest is measured and monitored as a routine management function.' *[IAS 41.6]*.

Biological transformation under IAS 41 'comprises the processes of growth, degeneration, production, and procreation that cause qualitative or quantitative changes in a biological asset'. *[IAS 41.5]*. The standard explains that biological transformation results in the following types of outcomes:

'(a) asset changes through (i) growth (an increase in quantity or improvement in quality of an animal or plant), (ii) degeneration (a decrease in the quantity or deterioration in quality of an animal or plant), or (iii) procreation (creation of additional living animals or plants); or

(b) production of agricultural produce such as latex, tea leaf, wool, and milk.' *[IAS 41.7]*.

IAS 41 defines the following additional terms that are used throughout the standard: *[IAS 41.5]*

- A *biological asset* is a living animal or plant.
- A *group of biological assets* is an aggregation of similar living animals or plants.
- *Agricultural produce* is the harvested product of the entity's biological assets.
- *Harvest* is the detachment of produce from a biological asset or the cessation of a biological asset's life processes.
- *Costs to sell* are the incremental costs directly attributable to the disposal of an asset excluding finance costs and income taxes.

The standard provides examples to illustrate the above definitions. In addition to providing these examples, the standard notes that some of the plants mentioned in the table may meet the definition of bearer plants and, therefore, be within the scope of IAS 16. However, the produce growing on such plants is within the scope of IAS 41 (see 2.2.1.A and 2.3.3 below) and is considered a biological asset. *[IAS 41.5C]*. Figure 42.1 below is based on those examples, but has been modified to provide examples of possible bearer plants and produce growing on those plants: *[IAS 41.4]*

Figure 42.1: Examples of biological assets (including possible bearer plants), agricultural produce and products that are the result of processing after harvest

Biological assets that may meet the definition of a bearer plant	**Biological assets (including produce growing on a bearer plant)**	**Agricultural produce**	**Products that are the result of processing after harvest**
	Sheep	Wool	Yarn, carpet
	Trees in a timber plantation	Felled trees	Logs, lumber
	Dairy cattle	Milk	Cheese
	Pigs	Carcass	Sausages, cured hams
Cotton plants	Growing cotton	Harvested cotton	Thread, clothing
Sugar-cane roots	Growing sugarcane	Harvested cane	Sugar
Tobacco plants	Leaves on the tobacco plants	Picked leaves	Cured tobacco
Tea bushes	Leaves on the tea bushes	Picked leaves	Tea
Grape vines	Grapes on the vines	Picked grapes	Wine
Fruit trees	Fruit on the trees	Picked fruit	Processed fruit
Oil palms	Growing fruit	Picked fruit	Palm oil
Rubber trees	Latex	Harvested latex	Rubber products

2.2.1.A Definition of bearer plants

A bearer plant is defined as ‘a living plant that:

(a) is used in the production or supply of agricultural produce;

(b) is expected to bear produce for more than one period; and

(c) has a remote likelihood of being sold as agricultural produce, except for incidental scrap sales’. *[IAS 41.5]*.

All of the above criteria need to be met for a plant to be considered a bearer plant.

The definition captures plants that would intuitively be considered to be bearers, for instance, grape vines. Some plants that may appear to be consumable, such as the root systems of perennial plants (e.g. sugar cane, bamboo or asparagus), but due to the perennial nature of their root systems, they are expected to meet the definition of a bearer plant.

Annual crops and other plants that are held solely to be harvested as agricultural produce (e.g. many traditional arable crops such as maize, wheat and soya, as well as trees grown for lumber), are explicitly excluded from the definition of a bearer plant. In addition, plants that have a dual use (i.e. plants cultivated to bear agricultural produce, but for which there is more than a remote likelihood that the plant itself will be harvested and sold as agricultural produce, beyond incidental scrap sales) are not bearer plants. *[IAS 41.5A]*. This may be the case when, for example, an entity holds rubber trees to sell both the latex as agricultural produce and the trees as lumber.

Bearer animals, like bearer plants, may be held solely for the produce that they bear. However, when IAS 41 was amended to exclude bearer plants from its scope, bearer animals were explicitly excluded from the amendments and continue to be accounted for under IAS 41 on the basis that the measurement model would become more complex if applied to such assets.

Determining whether an asset meets the definition of a bearer plant may not be entirely intuitive. Careful assessment is, therefore, important. We believe that judgement is needed in the following areas:

- *Used in the production or supply of agricultural produce*

  Judgement may be needed to determine whether a plant is used in the production or supply of agricultural produce, rather than consumed in the process. For example, some plants that are generally thought of as consumable are harvested twice, but with the first harvest having the principal purpose of improving the yield of the second harvest. It is not clear whether the fact that there are two harvests is sufficient to make these plants bearer assets.

  For certain plants, new produce may be capable of being grown from various parts of the plant (e.g. pineapples). For others, the plant itself may be cut back and re-grown. For example, after a harvest of bananas, the banana plant may be cut down to its base and re-grown the next year to produce more bananas. In such situations, judgement may be needed to determine which part of the plant might be the bearer plant (e.g. the banana palm or the base).

- *Expected to bear produce for more than one period*

  The definition of a bearer plant requires that a plant be expected to bear produce for more than one period. It would seem appropriate to think of an annual period in this context. However, the standard does not use this term, so an entity needs to consider if an interim period, a season or a production cycle (i.e. through to harvest) might also be appropriate.

- *Incidental scrap sales*

  Whether the likelihood of the plant being sold as agricultural produce is remote is also a matter of judgement. However, it is intended to be a high hurdle. The standard does allow for the fact that there may be some 'incidental scrap sales', but this term is not defined.

  The standard notes that bearer plants might be cut down and sold as scrap, (e.g. for firewood) at the end of their productive life and states that 'such incidental scrap sales would not prevent the plant from satisfying the definition of a bearer plant'. *[IAS 41.5B]*. However, in the example given in the standard (i.e. firewood), it is reasonably evident that such sales would be 'incidental'. Since no further guidance is given in the standard, entities need to apply judgement in determining what constitutes 'scrap sales' (e.g. would it include ad-hoc sales before the productive life has ended, such as selling trees removed while thinning?). Furthermore, the standard does not clarify at what level sales cease to be incidental and whether this is a qualitative or quantitative assessment. Therefore, judgement may be needed.

In addition to the considerations above, an entity may also need to reassess whether a plant meets the definition of a bearer plant after initial recognition. If a plant initially meets the definition of a bearer plant, but this subsequently changes, would IAS 41 then apply instead of IAS 16? Neither IAS 16 nor IAS 41 address this question or specify how to transfer such assets between IAS 16 and IAS 41 (or *vice versa*).

In the absence of guidance, management will need to apply judgement in developing an accounting policy in these situations. For example, entities might look to the requirements in IAS 40 – *Investment Property* – on transfers of property to, or from investment property for guidance on determining the threshold for when to account for a transfer of bearer plants to biological assets. Paragraph 57 of IAS 40 requires a transfer when there is 'a change in use' and states that '[a] change in use occurs when ... there is evidence of the change in use. In isolation, a change in management's intentions for the use of a property does not provide evidence of a change in use.' *[IAS 40.57]*.

Entities should, however, note that the Basis for Conclusions on IAS 16 states, 'The Board noted that it would be rare for transfers to take place between IAS 16 and IAS 41 for bearer plants, particularly in the light of the Board's decision to change criterion (c) of the definition of a bearer plant to "has a remote likelihood of being sold as agricultural produce, except for incidental scrap sales"'. *[IAS 16.BC83]*.

2.2.2 General definitions

IAS 41 defines the general terms it uses throughout the standard as follows: *[IAS 41.8]*

- *Carrying amount* is the amount at which an asset is recognised in the statement of financial position.
- Government grants are as defined in IAS 20 – *Accounting for Government Grants and Disclosure of Government Assistance* (see Chapter 24).

IFRS 13 – *Fair Value Measurement* – defines fair value as 'the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date'. *[IAS 41.8, IFRS 13.9]*. Measuring fair value in accordance with IFRS 13 is discussed further at 4 below and in Chapter 14.

2.3 Scope

IAS 41 applies to most biological assets, agricultural produce at the point of harvest and government grants involving biological assets measured at fair value less costs to sell. However, to be within the scope of IAS 41, these items must relate to agricultural activity. *[IAS 41.1]*. As discussed at 2.2.1 above, agricultural activity refers to 'the management by an entity of the biological transformation and harvest of biological assets for sale or for conversion into agricultural produce or into additional biological assets'. *[IAS 41.5]*. It is important to note that this definition does not focus on the primary purpose of holding such assets or the number of sales that may result. In fact, the definition refers to 'sale or conversion'; therefore, an entity need not intend to sell the biological assets or agricultural produce in order for the entity to be undertaking agricultural activity. Furthermore, the standard contemplates an entity applying IAS 41 to assets that it will use itself; the Basis for Conclusions refers, as an example, to an entity accounting for trees as biological assets within IAS 41 when it intends to use the harvested logs in the construction of a building for its own use. *[IAS 41.B8]*.

IAS 41 explicitly excludes the following assets from its scope: *[IAS 41.2]*

- bearer plants (see 2.2.1.A above), which are within the scope of IAS 16 (see Chapter 18), however, produce growing on a bearer plant is still within the scope of IAS 41;
- government grants that relate to bearer plants, to which IAS 20 applies (see Chapter 24);
- land related to agricultural activity, which should be accounted for under either IAS 16 (see Chapter 18) or IAS 40 (see Chapter 19); *[IAS 41.B55-B57]*
- intangible assets related to agricultural activity, for instance the costs of developing new disease resistant crops, which should be accounted for under IAS 38 – *Intangible Assets* (see Chapter 17); *[IAS 41.B58-B60]* and
- right-of-use assets arising from a lease of land related to agricultural activity, which is accounted for under IFRS 16 – *Leases* (see Chapter 23).

2.3.1 *Biological assets outside the scope of IAS 41*

Biological assets may be outside the scope of IAS 41 when they are not used in agricultural activity. For example, animals in a zoo (or game park) that does not have an active breeding programme and rarely sells any animals or animal products would be outside the scope of the standard. Another example is activities in the pharmaceutical industry that involve the culture of bacteria. Such activity would not fall within the scope of IAS 41. While the bacteria may be considered a biological asset, the development of a culture by a pharmaceutical company would not constitute agricultural activity.

Biological assets outside the scope of IAS 41 will normally fall within the scope of either IAS 16 (see Chapter 18) or IAS 2 – *Inventories* (see Chapter 22).

2.3.2 *Agricultural produce before and after harvest*

IAS 41 applies to agricultural produce (i.e. harvested produce) at the point of harvest only; not prior or subsequent to harvest. Under IAS 41, unharvested agricultural produce is considered to be part of the biological asset from which it will be harvested. Therefore, before harvest, agricultural produce should not be accounted for separately from the biological asset from which it comes. For example, milk is accounted for as part of the dairy cow right up to the moment at which the cow is milked.

Subsequent to harvest, agricultural produce is accounted for under IAS 2 or another standard, if applicable. *[IAS 41.3]*. Under IAS 2, agricultural produce is initially recognised as inventory at its fair value less costs to sell (measured in accordance with IAS 41), which becomes its cost for IAS 2 purposes (see Chapter 22). *[IAS 41.B41, B45]*.

2.3.3 *Bearer plants and produce growing on a bearer plant*

IAS 41 explicitly excludes bearer plants (see 2.2.1.A above) from its scope; instead IAS 16 applies to these assets (see Chapter 18). However, the produce growing on a bearer plant remains within the scope of IAS 41. *[IAS 41.2(b)]*.

Entities will need to carefully assess which of its plants meet the definition of a bearer plant. This is because the scope exclusion, while focused on the definition of a bearer plant, also affects the accounting treatment for the produce growing on a bearer plant and any related government grants (see 3.3 below).

Bearer plants and their agricultural produce are considered to be two separate assets for accounting purposes (i.e. two units of account), with different measurement models being applied under different standards (see 3.2.3 below for further discussion).

In developing the requirements for bearer plants, the Board noted that bearer plants are held by an entity solely to grow produce over their productive life, similar to plant and equipment and, therefore, do not directly affect the entity's future cash flows. As a result, it decided that bearer plants should be treated as property, plant and equipment in accordance with IAS 16. However, the IASB believes that 'the same argument is not true for the produce growing on the bearer plants that is undergoing biological transformation until it is harvested (for example, grapes growing on a grape vine). The Board observed that the produce is a consumable biological asset growing on the bearer plant and the growth of the produce directly increases the expected revenue from the sale of the produce. Consequently, fair value measurement of the growing produce provides useful information to users of financial statements about future cash flows that an entity is expected to realise'. *[IAS 41.BC4B]*. The Board also indicated that such produce ultimately has a market value on its own, whereas the bearer plants on which it grows generally do not. As such, the Board decided that produce growing on a bearer plant should remain within the scope of IAS 41, which is expected to ensure consistency between produce growing in the ground and produce growing on a bearer plant. *[IAS 41.BC4A-BC4D]*.

2.3.4 *Products that are the result of processing after harvest*

IAS 41 does not deal with the processing of agricultural produce after harvest. The standard makes it clear that, even if the processing is considered 'a logical and natural extension of agricultural activity, and the events taking place ... bear some similarity to biological transformation, such processing is not included within the definition of agricultural activity'. *[IAS 41.3]*. For example, the process of brewing beer – in which yeast (a fungus) converts sugars into alcohol – would not meet the definition of agricultural activity in the standard. Similarly, cheese production would fall outside the definition of agricultural activity.

2.3.5 *Leases of biological assets (excluding bearer plants)*

Leases involving biological assets are common in some jurisdictions, for example, the leasing of a sheep farm, where the lessee rents the farm, including the land, sheep and other assets, tends the sheep and sells the wool. Other examples include leased dairy cows.

2.3.5.A Leases of biological assets (excluding bearer plants) – lessee accounting

IFRS 16 excludes from its scope the lessee accounting for leases of biological assets that are within the scope of IAS 41. *[IFRS 16.3(b)]*. The scope exemption in IFRS 16 does not specify whether the asset would be recognised in accordance with IAS 41; only that it is an asset that would be within the scope of IAS 41. Nor does it explain how an entity would account for its lease liability since it is outside the scope of IFRS 16. Entities affected by this scope exemption will need to use judgement to develop an appropriate accounting policy, considering the requirements of IAS 8 – *Accounting Policies, Changes in Accounting Estimates and Errors* (see Chapter 3), especially paragraphs 10-13.

It is important to note that leases of bearer plants that are within the scope of IAS 16 are not excluded from the scope of IFRS 16. 'Consequently, leases of bearer plants such as orchards and vineyards held by a lessee are within the scope of IFRS 16'. *[IFRS 16.BC68(b)]*.

2.3.5.B Leases of biological assets (excluding bearer plants) – lessor accounting

Chapter 23 contains a discussion of lessor accounting. For lessors, leases of biological assets, including those within the scope of IAS 41, are within the scope of IFRS 16. A lessor would account for its leases as either operating or finance leases in accordance with IFRS 16. *[IFRS 16.67-97]*.

For finance leases of biological assets the lessor would:

- Account for the net investment in the lease (i.e. the lease receivable, not the biological asset) in accordance with IFRS 16.

For operating leases of biological assets the lessor would:

- Account for the lease payments as income in accordance with IFRS 16.
- Present the leased biological asset in accordance with its nature, consistent with other assets in the scope of IAS 41.
- Account for other rights and obligations under the lease (e.g. lease income) in accordance with IFRS 16.
- Make disclosures both in accordance with IFRS 16, and for the asset subject to the operating lease, in accordance with IAS 41. *[IFRS 16.81-88]*.

Beyond discussing certain costs, depreciation and impairment, paragraphs 81-88 of IFRS 16 do not specifically discuss how to recognise and measure the asset subject to an operating lease if it is within the scope of IAS 41. *[IFRS 16.81-88]*. Paragraphs BC58-BC66 of IFRS 16 outline the IASB's rationale in retaining the requirements of the predecessor standard to IFRS 16, IAS 17 – *Leases*, for lessors, virtually unchanged. *[IFRS 16.BC58-BC66]*. Furthermore, paragraph B82(n) of the Basis for Conclusions on IAS 41, which outlined the interaction between IAS 41 and IAS 17, was not amended on the issuance of IFRS 16. *[IAS 41.B82(n)]*. Therefore, it is likely that lessors will continue to measure a biological asset in accordance with IAS 41.

Such lease arrangements may include the land to which the asset is attached. Any leased land would need to be separately accounted for under the relevant standard, for example IAS 16 or IAS 40, as it is explicitly excluded from the scope of IAS 41 (see 2.3 above). *[IAS 41.2(e)]*.

It is worth noting that, unless specifically excluded from its scope, IAS 41 applies to all biological assets when they relate to agricultural activity. *[IAS 41.1]*. In the example above, where the sheep are leased under an operating lease, the wool is the agricultural produce. The sheep are being managed to produce that wool, albeit by the lessee and not the lessor. Since IAS 41 does not specify who must do the managing, the definition of agricultural activity is met. Therefore, the leased sheep would be a lease of biological assets within the scope of IAS 41.

2.3.6 Concessions

A concession typically involves a government, or other controlling authority, granting land to an entity, but requiring that the land be used for a specific purpose, for example, growing certain crops for a minimum period of time.

The treatment of each concession will depend on the specific facts and circumstances. However, if the concession requires an entity to undertake agricultural activity, as defined in IAS 41 (see 2.2.1 above), the biological assets (other than bearer plants) and agriculture produce will be within the scope of IAS 41. The grant received may also be within the scope of the standard. However, the land granted would be within the scope of IAS 16 or IAS 40 (see Chapters 18 and 19, respectively). The discussion at 3.3 below addresses the treatment of government grants related to biological assets (other than bearer plants).

3 RECOGNITION AND MEASUREMENT PRINCIPLES

3.1 Recognition

An entity recognises a biological asset (including produce growing on a bearer plant) or agricultural produce that is within the scope of IAS 41 only when:

(a) it controls the asset as a result of past events;

(b) it is probable that future economic benefits associated with the asset will flow to the entity; and

(c) the fair value or cost of the asset can be measured reliably. *[IAS 41.10]*

Considerations for the recognition of produce growing on a bearer plant are discussed at 3.2.3.B below.

3.1.1 Control

In agricultural activity, an entity may evidence control by, for example, 'legal ownership of cattle and the branding or otherwise marking of the cattle on acquisition, birth, or weaning'. *[IAS 41.11]*.

3.2 Measurement

3.2.1 Biological assets within the scope of IAS 41

3.2.1.A Initial and subsequent measurement

A biological asset that is within the scope of IAS 41 (i.e. excluding bearer plants, but including produce growing on a bearer plant) is measured on initial recognition and at the end of each reporting period at its fair value less costs to sell, unless an entity can demonstrate at initial recognition that fair value cannot be measured reliably. *[IAS 41.12]*. In the latter case, the entity measures the biological asset at historic cost less any accumulated depreciation and any accumulated impairment losses (see 3.2.5 below), unless/until fair value becomes reliably measurable. *[IAS 41.30]*.

3.2.1.B Subsequent expenditure

IAS 41 does not prescribe how an entity should account for subsequent expenditure in relation to biological assets, because the (then) IASC believed this to be unnecessary with a fair-value-based measurement approach. *[IAS 41.B62]*.

Such expenditure may be expensed as incurred or capitalised as additions to the related biological asset. However, under the fair value model, the biological asset will be re-measured at the end of each reporting period. As such, any amounts capitalised will only result in a reallocation between expenses and the fair value gain or loss for the biological asset. Therefore, an entity's policy in relation to subsequent expenditure will have no effect on its equity or net profit or loss, although it will affect:

- the reconciliation of changes in the carrying amount of biological assets;
- the classification of the expenditure in the income statement as either an expense or as part of the net gain or loss on biological assets; and
- the presentation of subsequent expenditure on biological assets in the statement of cash flows as either operating or investing activities, as appropriate.

In our view, an entity should select an accounting policy for subsequent expenditure that is broadly consistent with the principles in other standards, such as IAS 16 and IAS 38. For example, in the case of livestock, an entity may expense maintenance costs, such as routine vaccinations, while treating costs that increase the originally expected yield of the asset as capital expenditure. In this case, an entity must consider whether it is appropriate to add costs that improve initially anticipated yields (such as additional vaccinations or feed supplements) to the carrying value of the asset. However, such additions would be adjusted at each period end when the biological asset concerned is revalued to its new fair value. Judgement may be required to determine whether costs that take place after maturity (e.g. vaccinations or feed supplements) would be maintenance costs or improvements. Furthermore, care will be needed when costs are related to both bearer plants and produce growing on a bearer plant or when it is not clear to which of those assets it relates. This is discussed further at 3.2.3 below.

In September 2019, the IFRS Interpretations Committee discussed a submission about the accounting for costs related to the biological transformation of biological assets (subsequent expenditure) applying IAS 41. The submitter asked whether an entity; (a) recognises subsequent expenditure as an expense when incurred; or (b) capitalises the subsequent expenditure (i.e. adds it to the carrying amount of the asset).

The Committee decided not to take the issue onto its standard setting agenda noting that IAS 41 does not specify requirements on the accounting for subsequent expenditure and an entity can either capitalise subsequent expenditure or recognise it as an expense when incurred. The Committee observed that capitalising subsequent expenditure or recognising it as an expense has no effect on the fair value measurement of biological assets nor does it have any effect on profit or loss; however, it affects the presentation of amounts in the statement of profit or loss.

The Committee drew attention to the requirements of:

- paragraph 13 of IAS 8, whereby an entity would apply its accounting policy for subsequent expenditure consistently to each group of biological assets; and
- paragraphs 117-124 of IAS 1 – *Presentation of Financial Statements* – whereby an entity would also disclose the selected accounting policy if that disclosure would assist users of financial statements in understanding how those transactions are reflected in reported financial performance. *[IAS 1.117-124; IAS 8.13]*.

The Committee also noted that when 'assessing how to present such subsequent expenditure in the statement of profit or loss, an entity would apply the requirements in paragraphs 81–105 of IAS 1'. In particular, an 'entity would:

- applying paragraph 85, "present additional line items (including by disaggregating the line items listed in paragraph 82), headings and subtotals in the statement(s) presenting profit or loss and other comprehensive income when such presentation is relevant to an understanding of the entity's financial performance"; and
- applying paragraph 99, present in the statement(s) presenting profit or loss and other comprehensive income or in the notes an analysis of expenses recognised in profit or loss using a classification based on either their nature or their function within the entity, whichever provides information that is reliable and more relevant'. *[IAS 1.85, 99]*.[1]

The presentation of items in the statement of profit or loss is further discussed In Chapter 3 at 3.2.

3.2.2 Agricultural produce

Agricultural produce harvested from an entity's biological assets should initially 'be measured at its fair value less costs to sell at the point of harvest'. *[IAS 41.13]*. The standard presumes that an entity can always reliably measure this amount and hence does not permit valuation at historical cost. *[IAS 41.32, B43]*.

The value resulting from initial measurement is subsequently used as cost in applying IAS 2 (if the agricultural produce is to be sold, see Chapter 22), IAS 16 (if harvested logs are used for the construction of a building, see Chapter 18) or other applicable IFRSs. *[IAS 41.13, B8]*.

An important reason for requiring agricultural produce at the point of harvest to be measured at fair value was to ensure that the basis of measurement would be consistent with that of biological assets and to avoid inconsistent and distorted reporting of current period performance upon harvest of agricultural produce. *[IAS 41.B42]*.

3.2.3 Requirements for produce growing on a bearer plant

3.2.3.A Requirements for bearer plants in the scope of IAS 16

Bearer plants are subject to all of the recognition and measurement requirements in IAS 16 (see Chapter 18), including the following (see Figure 42.2 below):

- before maturity, bearer plants must be measured at their accumulated cost, similar to the accounting treatment for a self-constructed item of plant and equipment before it is available for use; *[IAS 16.22A]* and
- after the bearer plant is mature, entities have a policy choice to measure the bearer plants using either the cost model or the revaluation model. *[IAS 16.29]*. It is important to note that:
  - if the revaluation model is selected, revaluations need to take place with sufficient regularity to ensure the carrying amount does not differ materially from the asset's fair value had it been measured at the end of the reporting period; *[IAS 16.22A]*
  - entities following either model need to determine the useful life of the bearer plant in order to depreciate it. The useful life needs to be re-evaluated each year; *[IAS 16.51]* and
  - unlike biological assets within the scope of IAS 41, items of property, plant and equipment within the scope of IAS 16 are not scoped out of IAS 36 – *Impairment of Assets*. Entities, therefore, need to assess whether there are indicators that a bearer plant is impaired at the end of each reporting period. If such indicators exist, the bearer plant will be subject to an impairment test in accordance with IAS 36. *[IAS 16.63, IAS 36.8-9]*. An impairment loss will be recognised if the carrying value is higher than the bearer asset's recoverable amount (being the higher of the asset's fair value less costs of disposal and its value in use). *[IAS 36.60]*. The requirements of IAS 36 are discussed in Chapter 20.

The requirements for bearer plants do not completely eliminate volatility in profit or loss, as entities still need to recognise any changes in the fair value of agricultural produce growing on the bearer plant, as discussed at 3.2.3.B below.

Figure 42.2: Measurement requirements for bearer plants (assuming fair value can be reliably measured)

At initial recognition	• Measured separately from any related agricultural produce (i.e. two units of account). • Measured at cost, accumulated until maturity.

Subsequent measurement requirements	• Measured separately from any related agricultural produce (i.e. two units of account).
	• Measured at:
	  • cost, less any subsequent accumulated depreciation and impairment, with changes recognised in profit or loss; or
